Fields

Field	Function
31 ARPEN	ARP Offload Enable When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus. When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus. This bit is available only when the Enable IPv4 ARP Offload is selected. 0b - ARP Offload is disabled 1b - ARP Offload is enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
30-28 SARC	Source Address Insertion or Replacement Control This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]: 2'b0x: - The mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation. 2'b10: - If Bit 30 is set to 0, the MAC inserts the content of the MAC Address 0 registers in the SA field of all transmitted packets. - If Bit 30 is set to 1 and the Enable MAC Address Register 1 option is selected while configuring the IP, the MAC inserts the content of the MAC Address 1 registers in the SA field of all transmitted packets. 2'b11: - If Bit 30 is set to 0, the MAC replaces the content of the MAC Address 0 registers in the SA field of all transmitted packets. - If Bit 30 is set to 1 and the MAC Address Register 1 is enabled, the MAC replaces the content of the MAC Address 1 registers in the SA field of all transmitted packets. Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 000b - mti_sa_ctrl_i and ati_sa_ctrl_i input signals control the SA field generation 010b - Contents of MAC Addr-0 inserted in SA field 011b - Contents of MAC Addr-0 replaces SA field 110b - Contents of MAC Addr-1 inserted in SA field 111b - Contents of MAC Addr-1 replaces SA field
27 IPC	Checksum Offload When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled. The Layer 3 and Layer 4 Packet Filter and Enable Split Header features automatically selects the IPC Full Checksum Offload Engine on the Receive side. When any of these features are enabled, you must set the IPC bit. 0b - IP header/payload checksum checking is disabled 1b - IP header/payload checksum checking is enabled
26-24 IPG	Inter-Packet Gap These bits control the minimum IPG between packets during transmission. This range of minimum IPG is valid in full-duplex mode. In the half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered. When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG. This function (IPG less than 96 bit times) is valid only when EIPGEN bit in MAC_Ext_Configuration register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in MAC_Ext_Configuration register. 000b - 96 bit times IPG 001b - 88 bit times IPG 010b - 80 bit times IPG 011b - 72 bit times IPG 100b - 64 bit times IPG

Table continues on the next page...

Table continued from the previous page...

Field	Function
	101b - 56 bit times IPG 110b - 48 bit times IPG 111b - 40 bit times IPG
23 GPSLCE	Giant Packet Size Limit Control Enable When this bit is set, the MAC considers the value in GPSL field in MAC_Ext_Configuration register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit. When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet). The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status. 0b - Giant Packet Size Limit Control is disabled 1b - Giant Packet Size Limit Control is enabled
22 S2KP	IEEE 802.3as Support for 2K Packets When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets. When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. For more information about how the setting of this bit and the JE bit impact the Giant packet status, see the Table, Giant Packet Status based on S2KP and JE Bits. Note: When the JE bit is set, setting this bit has no effect on the giant packet status. 0b - Support upto 2K packet is disabled 1b - Support upto 2K packet is Enabled
21 CST	CRC stripping for Type packets When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. Note: For information about how the settings of the ACS bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bits. 0b - CRC stripping for Type packets is disabled 1b - CRC stripping for Type packets is enabled
20 ACS	Automatic Pad or CRC Stripping When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field. When this bit is reset, the MAC passes all incoming packets to the application, without any modification. Note: For information

Table continues on the next page...

Table continued from the previous page...

Field	Function
	about how the settings of CST bit and this bit impact the packet length, see the Table, Packet Length based on the CST and ACS Bit . 0b - Automatic Pad or CRC Stripping is disabled 1b - Automatic Pad or CRC Stripping is enabled
19 WD	Watchdog Disable When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes. When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes. 0b - Watchdog is enabled 1b - Watchdog is disabled
18 BE	Packet Burst Enable When this bit is set, the MAC allows packet bursting during transmission in the GMII half-duplex mode. 0b - Packet Burst is disabled 1b - Packet Burst is enabled
17 JD	Jabber Disable When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes. When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet. 0b - Jabber is enabled 1b - Jabber is disabled
16 JE	Jumbo Packet Enable When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status. 0b - Jumbo packet is disabled 1b - Jumbo packet is enabled
15 PS	Port Select This bit selects the Ethernet line speed. This bit, along with Bit 14, selects the exact line speed. In the 10/100 Mbps-only (always 1) or 1000 Mbps-only (always 0) configurations, this bit is read-only (RO) with appropriate value. In default 10/100/1000 Mbps configurations, this bit is read-write (R/W). The mac_speed_o[1] signal reflects the value of this bit. 0b - For 1000 or 2500 Mbps operations 1b - For 10 or 100 Mbps operations
14 FES	Speed This bit selects the speed mode. The mac_speed_o[0] signal reflects the value of this bit.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - 10 Mbps when PS bit is 1 and 1 Gbps when PS bit is 0 1b - 100 Mbps when PS bit is 1 and 2.5 Gbps when PS bit is 0
13 DM	Duplex Mode When this bit is set, the MAC operates in the full-duplex mode in which it can transmit and receive simultaneously. This bit is RO with default value of 1'b1 in the full-duplex-only configurations. 0b - Half-duplex mode 1b - Full-duplex mode
12 LM	Loopback Mode When this bit is set, the MAC operates in the loopback mode at GMII or MII. The (G)MII Rx clock input (CLK_RX_I) is required for the loopback to work properly. This is because the Tx clock is not internally looped back. 0b - Loopback is disabled 1b - Loopback is enabled
11 ECRSFD	Enable Carrier Sense Before Transmission in Full-Duplex Mode When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the full-duplex mode. The MAC starts the transmission only when the CRS signal is low. When this bit is reset, the MAC transmitter ignores the status of the CRS signal. 0b - ECRSFD is disabled 1b - ECRSFD is enabled
10 DO	Disable Receive Own When this bit is set, the MAC disables the reception of packets when the gmii_txen_o is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY. This bit is not applicable in the full-duplex mode. 0b - Enable Receive Own 1b - Disable Receive Own
9 DCRS	Disable Carrier Sense During Transmission When this bit is set, the MAC transmitter ignores the (G)MII CRS signal during packet transmission in the half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission. When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission. 0b - Enable Carrier Sense During Transmission 1b - Disable Carrier Sense During Transmission
8 DR	Disable Retry When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive

Table continues on the next page...

Table continued from the previous page...

Field	Function
	collision error in the Tx packet status. When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the half-duplex mode. 0b - Enable Retry 1b - Disable Retry
7 —	Reserved
6-5 BL	Back-Off Limit The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000/2500 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision. n = retransmission attempt. The random integer r takes the value in the range 0 <= r < 2^k This bit is applicable only in the half-duplex mode. 00b - k = min(n,10) 01b - k = min(n,8) 10b - k = min(n,4) 11b - k = min(n,1)
4 DC	Deferral Check When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode. If the MAC is configured for 1000/2500 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII. The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted. When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive. This bit is applicable only in the half-duplex mode. 0b - Deferral check function is disabled 1b - Deferral check function is enabled
3-2 PRELEN	Preamble Length for Transmit packets These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the full-duplex mode. 00b - 7 bytes of preamble 01b - 5 bytes of preamble 10b - 3 bytes of preamble 11b - Reserved
1	Transmitter Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
TE	When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets. 0b - Transmitter is disabled 1b - Transmitter is enabled
0 RE	Receiver Enable When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface. 0b - Receiver is disabled 1b - Receiver is enabled

76.17.3 MAC Extended Configuration (MAC_Ext_Configuration)

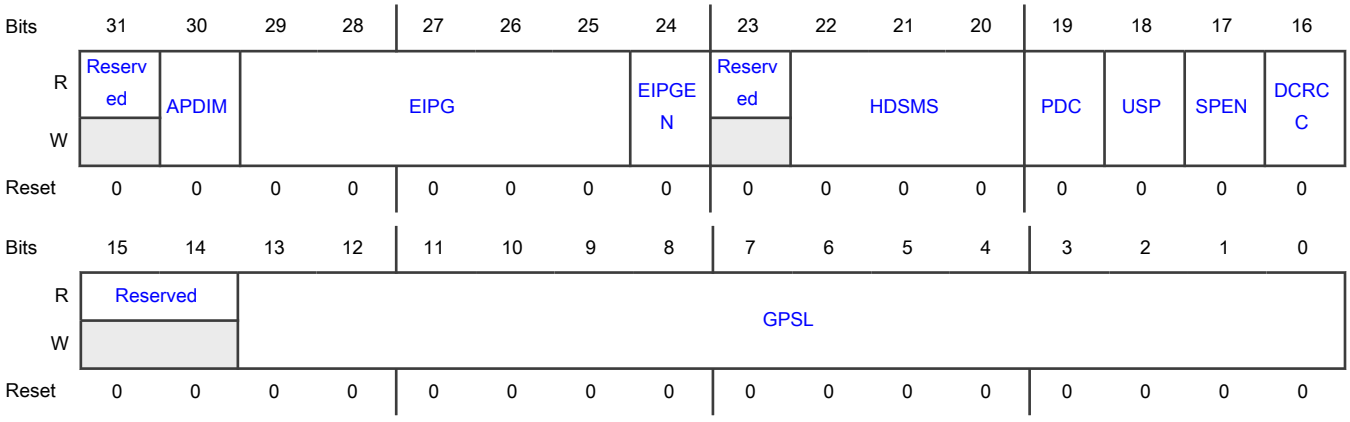
Offset

Register	Offset
MAC_Ext_Configuration	4h

Function

The MAC Extended Configuration Register establishes the operating mode of the MAC.

Diagram



Fields

Field	Function
31 —	Reserved
30 APDIM	ARP Packet Drop if IP Address Mismatch When this bit is set, Packet for which Target Protocol Address does not match IPv4 address is dropped in the MTL layer. When this bit is reset, when target Protocol Address does not match, packet is forwarded to MTL maintaining backward compatibility 0b - mux select to drop the arp packet if target protocol address mismatches IPv4 address disabled 1b - mux select to drop the arp packet if target protocol address mismatches IPv4 address enabled
29-25 EIPG	Extended Inter-Packet Gap The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits), along with IPG field in MAC_Configuration register, gives the minimum IPG greater than 96 bit times in steps of 8 bit times: {EIPG, IPG} 8'h00 - 104 bit times 8'h01 - 112 bit times 8'h02 - 120 bit times ---------- 8'hFF - 2144 bit times
24 EIPGEN	Extended Inter-Packet Gap Enable When this bit is set, the MAC interprets EIPG field and IPG field in MAC_Configuration register together as minimum IPG greater than 96 bit times in steps of 8 bit times. When this bit is reset, the MAC ignores EIPG field and interprets IPG field in MAC_Configuration register as minimum IPG less than or equal to 96 bit times in steps of 8 bit times. Note: Enable the extended Inter-Packet Gap feature only when operating in Full-Duplex mode. There might be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-Duplex mode. 0b - Extended Inter-Packet Gap is disabled 1b - Extended Inter-Packet Gap is enabled
23 —	Reserved
22-20 HDSMS	Maximum Size for Splitting the Header Data These bits indicate the maximum header size allowed for splitting the header data in the received packet. 000b - Maximum Size for Splitting the Header Data is 64 bytes 001b - Maximum Size for Splitting the Header Data is 128 bytes 010b - Maximum Size for Splitting the Header Data is 256 bytes 011b - Maximum Size for Splitting the Header Data is 512 bytes 100b - Maximum Size for Splitting the Header Data is 1024 bytes 101b - Reserved
19	Packet Duplication Control

Table continues on the next page...

Table continued from the previous page...

Field	Function
PDC	When this bit is set, the received packet with Multicast/Broadcast Destination address is routed to multiple Receive DMA Channels. The Receive DMA Channels is identified by the DCS field of MAC_Address(#i)_High register corresponding to the MAC Address register that matches the Multicast/ Broadcast Destination address in the received packet. The DCS field is interpreted to be a one-hot value, each bit corresponding to the Receive DMA Channel. When this bit is reset, the received packet is routed to single Receive DMA Channel. The Receive DMA Channel is identified by the DCS field of MAC_Address(#i)_High register corresponding to the MAC Address register that matches the Destination address in the received packet. The DCS field is interpreted as a binary value. 0b - Packet Duplication Control is disabled 1b - Packet Duplication Control is enabled
18 USP	Unicast Slow Protocol Packet Detect When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the MAC_Address0_High and MAC_Address0_Low registers. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02). When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2015, Section 5. 0b - Unicast Slow Protocol Packet Detection is disabled 1b - Unicast Slow Protocol Packet Detection is enabled
17 SPEN	Slow Protocol Detection Enable When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Slow Protocol Sub-Type and Code fields in Rx status. When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets. 0b - Slow Protocol Detection is disabled 1b - Slow Protocol Detection is enabled
16 DCRCC	Disable CRC Checking for Received Packets When this bit is set, the MAC receiver does not check the CRC field in the received packets. When this bit is reset, the MAC receiver always checks the CRC field in the received packets. 0b - CRC Checking is enabled 1b - CRC Checking is disabled
15-14 —	Reserved
13-0 GPSL	Giant Packet Size Limit If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes. For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. When the Enable Double VLAN Processing

Table continues on the next page...

Table continued from the previous page...

Field	Function
	option is selected, the MAC adds 8 bytes to the programmed value for double VLAN tagged packets. The value in this field is applicable when the GPSLCE bit is set in MAC_Configuration register.

76.17.4 MAC Packet Filter (MAC_Packet_Filter)

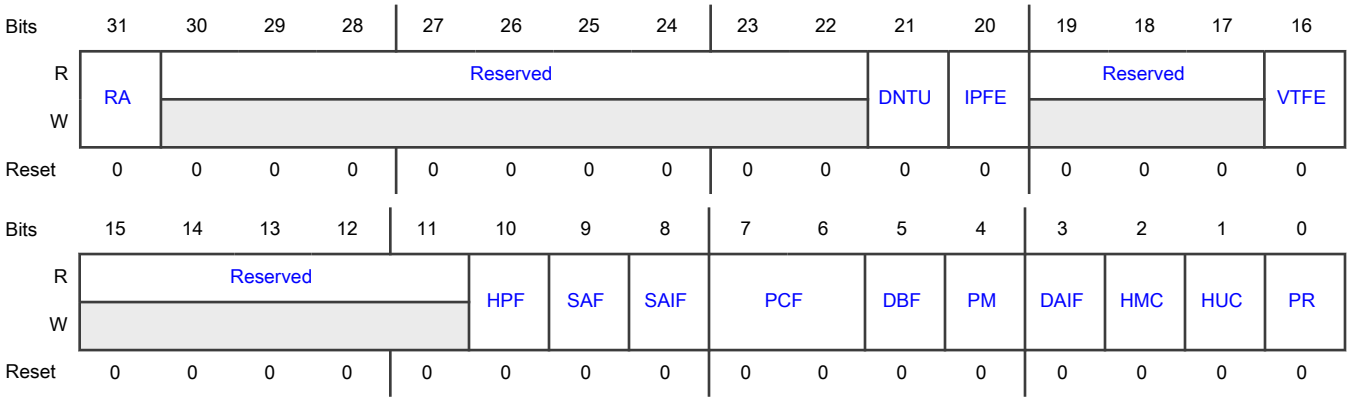
Offset

Register	Offset
MAC_Packet_Filter	8h

Function

The MAC Packet Filter register contains the filter controls for receiving packets. Some of the controls from this register go to the address check block of the MAC which performs the first level of address filtering. The second level of filtering is performed on the incoming packet based on other controls such as Pass Bad Packets and Pass Control Packets.

Diagram



Fields

Field	Function
31 RA	Receive All When this bit is set, the MAC Receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word. When this bit is reset, the Receiver module passes only those packets to the application that pass the SA or DA address filter. 0b - Receive All is disabled 1b - Receive All is enabled
30-22 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
21 DNTU	Drop Non-TCP/UDP over IP Packets When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets. 0b - Forward Non-TCP/UDP over IP Packets 1b - Drop Non-TCP/UDP over IP Packets
20 IPFE	Layer 3 and Layer 4 Filter Enable When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect. When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields. 0b - Layer 3 and Layer 4 Filters are disabled 1b - Layer 3 and Layer 4 Filters are enabled
19-17 —	Reserved
16 VTFE	VLAN Tag Filter Enable When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag. 0b - VLAN Tag Filter is disabled 1b - VLAN Tag Filter is enabled
15-11 —	Reserved
10 HPF	Hash or Perfect Filter When this bit is set, the address filter passes a packet if it matches either the perfect filtering or hash filtering as set by the HMC or HUC bit. When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter. 0b - Hash or Perfect Filter is disabled 1b - Hash or Perfect Filter is enabled
9 SAF	Source Address Filter Enable When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet. When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison. Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, in DWC_ether_qos, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA. 0b - SA Filtering is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - SA Filtering is enabled
8 SAIF	SA Inverse Filtering When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter. When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter. 0b - SA Inverse Filtering is disabled 1b - SA Inverse Filtering is enabled
7-6 PCF	Pass Control Packets These bits control the forwarding of all control packets (including unicast and multicast Pause packets). 00b - MAC filters all control packets from reaching the application 01b - MAC forwards all control packets except Pause packets to the application even if they fail the Address filter 10b - MAC forwards all control packets to the application even if they fail the Address filter 11b - MAC forwards the control packets that pass the Address filter
5 DBF	Disable Broadcast Packets When this bit is set, the AFM module blocks all the incoming broadcast packets. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast packets. 0b - Enable Broadcast Packets 1b - Disable Broadcast Packets
4 PM	Pass All Multicast When this bit is set, it indicates that all the received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit. 0b - Pass All Multicast is disabled 1b - Pass All Multicast is enabled
3 DAIF	DA Inverse Filtering When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed. 0b - DA Inverse Filtering is disabled 1b - DA Inverse Filtering is enabled
2 HMC	Hash Multicast When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the hash table. When this bit is reset, the MAC performs the perfect destination address

Table continues on the next page...

Table continued from the previous page...

Field	Function
	filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers. 0b - Hash Multicast is disabled 1b - Hash Multicast is enabled
1 HUC	Hash Unicast When this bit is set, the MAC performs the destination address filtering of unicast packets according to the hash table. When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers. 0b - Hash Unicast is disabled 1b - Hash Unicast is enabled
0 PR	Promiscuous Mode When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set. 0b - Promiscuous Mode is disabled 1b - Promiscuous Mode is enabled

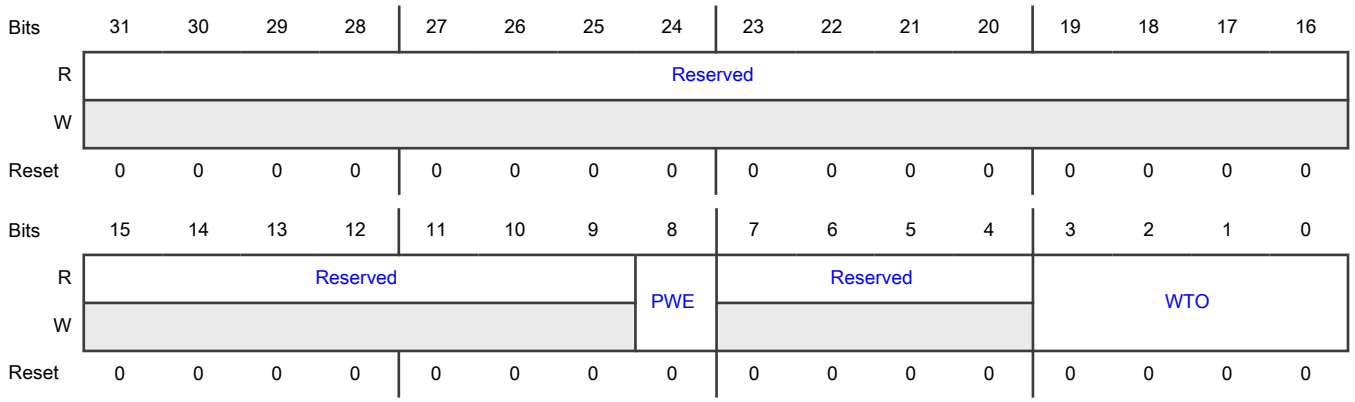
76.17.5 MAC Watchdog Timeout (MAC_Watchdog_Timeout)

Offset

Register	Offset
MAC_Watchdog_Timeout	Ch

Function
The Watchdog Timeout register controls the watchdog timeout for received packets.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 PWE	Programmable Watchdog Enable When this bit is set and the WD bit of the MAC_Configuration register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in MAC_Configuration register. 0b - Programmable Watchdog is disabled 1b - Programmable Watchdog is enabled
7-4 —	Reserved
3-0 WTO	Watchdog Timeout When the PWE bit is set and the WD bit of the MAC_Configuration register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet. Note: When the PWE bit is set, the value in this field should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped. 0000b - 2 KB 0001b - 3 KB 0010b - 4 KB 0011b - 5 KB 0100b - 6 KB 0101b - 7 KB 0110b - 8 KB 0111b - 9 KB 1000b - 10 KB 1001b - 11 KB 1010b - 12 KB 1011b - 13 KB 1100b - 14 KB 1101b - 15 KB 1110b - 16383 Bytes 1111b - Reserved

76.17.6 MAC Hash Table First 32 Bits (MAC_Hash_Table_Reg0)

Offset

Register	Offset
MAC_Hash_Table_Reg0	10h

Function

The Hash Table Register 0 contains the first 32 bits of the hash table, when the width of the hash table is 128 or 256 bits. You can specify the width of the hash table by using the Hash Table Size option in coreConsultant.

NOTE

In this chip, upper 6 bits should be used for 64-bit Hash Table.

The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5.

The hash value of the destination address is calculated in the following way:

- Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).

- Perform bitwise reversal for the value obtained in Step 1.

- Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC_Packet_Filter, all multicast packets are accepted regardless of the multicast hash values.

If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Hash Table Register X registers are written.

If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

76.17.12 MAC Hash Table Seventh 32 Bits (MAC_Hash_Table_Reg6)

Offset

Register	Offset
MAC_Hash_Table_Reg6	28h

Function

The Hash Table Register 0 contains the first 32 bits of the hash table, when the width of the hash table is 128 or 256 bits. You can specify the width of the hash table by using the Hash Table Size option in coreConsultant.

NOTE

In this chip, upper 6 bits should be used for 64-bit Hash Table.

The Hash table is used for group address filtering. For hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six (seven in 128-bit Hash or eight in 256-bit Hash) bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register X), and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 (in 64-bit Hash) selects Bit 0 of the Hash Table Register 1, a value of 7b'1110000 (in 128-bit Hash) selects Bit 16 of the Hash Table Register 3 and a value of 8b'10111111 (in 256-bit Hash) selects Bit 31 of the Hash Table Register 5.

The hash value of the destination address is calculated in the following way:

- Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).

- Perform bitwise reversal for the value obtained in Step 1.

- Take the upper 6 (or 7 or 8) bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1'b1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in MAC_Packet_Filter, all multicast packets are accepted regardless of the multicast hash values.

If the Hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the Hash Table Register X registers are written.

If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

Fields

Field	Function
31 EIVLRXS	Enable Inner VLAN Tag in Rx Status When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status. 0b - Inner VLAN Tag in Rx status is disabled 1b - Inner VLAN Tag in Rx status is enabled
30 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
29-28 EIVLS	Enable Inner VLAN Tag Stripping on Receive This field indicates the stripping operation on inner VLAN Tag in received packet. 00b - Do not strip 01b - Strip if VLAN filter passes 10b - Strip if VLAN filter fails 11b - Always strip
27 ERIVLT	Enable Inner VLAN Tag Comparison When this bit, VTHM bit and the EDVLP field are set, the MAC receiver enables VLAN Hash filtering operation on the inner VLAN Tag (if present). When this bit is reset and VTHM bit is set, the MAC receiver enables VLAN Hash filtering operation on the outer VLAN Tag (if present). The ERSVLM bit and DOVLTC bit determines which VLAN type is enabled for filtering. 0b - Inner VLAN tag is disabled 1b - Inner VLAN tag is enabled
26 EDVLP	Enable Double VLAN Processing When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present). 0b - Double VLAN Processing is disabled 1b - Double VLAN Processing is enabled
25 VTHM	VLAN Tag Hash Table Match Enable When this bit is set, the most significant four bits of CRC of VLAN Tag are used to index the content of the MAC_VLAN_Hash_Table register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN hash table. When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison. When the ETV bit is reset, the CRC of the 16-bit VLAN tag is used for comparison. When this bit is reset, the VLAN Hash Match operation is not performed. 0b - VLAN Tag Hash Table Match is disabled 1b - VLAN Tag Hash Table Match is enabled
24 EVLRXS	Enable VLAN Tag in Rx status When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status. 0b - VLAN Tag in Rx status is disabled 1b - VLAN Tag in Rx status is enabled
23 —	Reserved
22-21	Enable VLAN Tag Stripping on Receive

Table continues on the next page...

Table continued from the previous page...

Field	Function
EVLS	This field indicates the stripping operation on the outer VLAN Tag in received packet. 00b - Do not strip 01b - Strip if VLAN filter passes 10b - Strip if VLAN filter fails 11b - Always strip
20 DOVLTC	Disable VLAN Type Check for VLAN Hash Filtering When this bit is set, the MAC VLAN Hash Filter does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC VLAN Hash Filter filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit. 0b - VLAN Type Check is enabled 1b - VLAN Type Check is disabled
19 ERSVLM	Enable Receive S-VLAN Match for VLAN Hash Filtering When this bit is set, the MAC receiver enables VLAN Hash filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables VLAN Hash filtering or matching for C-VLAN (Type = 0x8100) packets. The ERIVLT bit determines the VLAN tag position considered for VLAN Hash filtering or matching. 0b - Receive S-VLAN Match is disabled 1b - Receive S-VLAN Match is enabled
18 ESVL	Enable S-VLAN When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets. 0b - S-VLAN is disabled 1b - S-VLAN is enabled
17 VTIM	VLAN Tag Inverse Match Enable When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched. 0b - VLAN Tag Inverse Match is disabled 1b - VLAN Tag Inverse Match is enabled
16 ETV	Enable 12-Bit VLAN Tag Comparison for VLAN Hash Filtering When this bit is set, a 12-bit VLAN identifier is used for VLAN Hash filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag in the received VLAN-tagged packet are used for hash-based VLAN filtering. When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for VLAN hash filtering.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - 12-Bit VLAN Tag Comparison is disabled 1b - 12-Bit VLAN Tag Comparison is enabled
15-7 —	Reserved
6-2 OFS	Offset This field holds the address offset of the MAC VLAN Tag Filter Register which the application is trying to access. The width of the field depends on the number of MAC VLAN Tag Registers enabled.
1 CT	Command Type This bit indicates if the current register access is a read or a write. When set, it indicate a read operation. When reset, it indicates a write operation. 0b - Write operation 1b - Read operation
0 OB	Operation Busy This bit is set along with a read or write command for initiating the indirect access to per VLAN Tag Filter register. This bit is reset when the read or write command to per VLAN Tag Filter indirect access register is complete. The next indirect register access can be initiated only after this bit is reset. During a write operation, the bit is reset only after the data has been written into the Per VLAN Tag register. During a read operation, the data should be read from the MAC_VLAN_Tag_Data register only after this bit is reset. 0b - Operation Busy is disabled 1b - Operation Busy is enabled

76.17.15 MAC VLAN Tag Data (MAC_VLAN_Tag_Data)

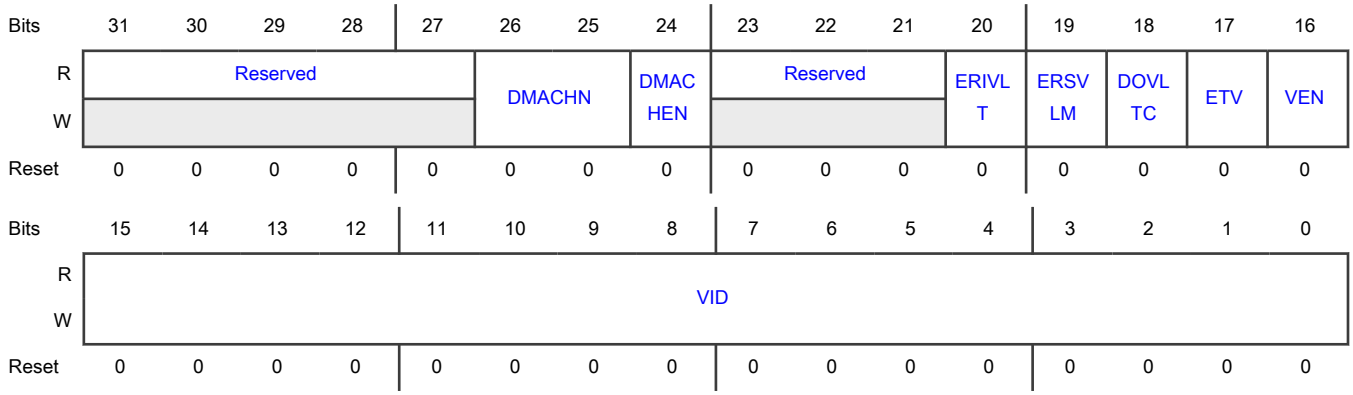
Offset

Register	Offset
MAC_VLAN_Tag_Data	54h

Function

This register holds the read/write data for Indirect Access of the Per VLAN Tag registers. During the read access, this field contains valid read data only after the OB bit is reset. During the write access, this field should be valid prior to setting the OB bit in the MAC_VLAN_Tag_Ctrl Register.

Diagram



Fields

Field	Function
31-27 —	Reserved
26-25 DMACHN	DMA Channel Number The DMA Channel number to which the VLAN Tagged Frame is to be routed if it passes this VLAN Tag Filter is programmed in this field. If the Routing based on VLAN Tag Filter is not necessary, this field need not be programmed.
24 DMACHEN	DMA Channel Number Enable This bit is the Enable for the DMA Channel Number value programmed in the field DMACH. When this bit is reset, the Routing does not occur based on VLAN Filter result. The frame is routed based on DA Based DMA Channel Routing. 0b - DMA Channel Number is disabled 1b - DMA Channel Number is enabled
23-21 —	Reserved
20 ERIVLT	Enable Inner VLAN Tag Comparison This bit is valid only when Double VLAN Tag Enable of the Filter is set. When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). 0b - Inner VLAN tag comparison is disabled 1b - Inner VLAN tag comparison is enabled
19 ERSVLM	Enable S-VLAN Match for received Frames This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.

Table continued from the previous page...

Field	Function
	0b - Receive S-VLAN Match is disabled 1b - Receive S-VLAN Match is enabled
18 DOVLTC	Disable VLAN Type Comparison This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC does not check whether the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC filters or matches the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit only when VLAN Tag type is similar to the one specified by the Enable S-VLAN Match for received Frames bit. 0b - VLAN type comparison is enabled 1b - VLAN type comparison is disabled
17 ETV	12bits or 16bits VLAN comparison This bit is valid only when VEN of the Filter is set. When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. 0b - 16 bit VLAN comparison 1b - 12 bit VLAN comparison
16 VEN	VLAN Tag Enable This bit is used to enable or disable the VLAN Tag. When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID. When this bit is reset, no comparison is performed irrespective of the programming of the other fields. 0b - VLAN Tag is disabled 1b - VLAN Tag is enabled
15-0 VID	VLAN Tag ID This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

16 VEN	VLAN Tag Enable This bit is used to enable or disable the VLAN Tag. When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID. When this bit is reset, no comparison is performed irrespective of the programming of the other fields. 0b - VLAN Tag is disabled 1b - VLAN Tag is enabled
15-0 VID	VLAN Tag ID This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

76.17.25 MAC VLAN Tag Filter 17 (MAC_VLAN_Tag_Filter17)

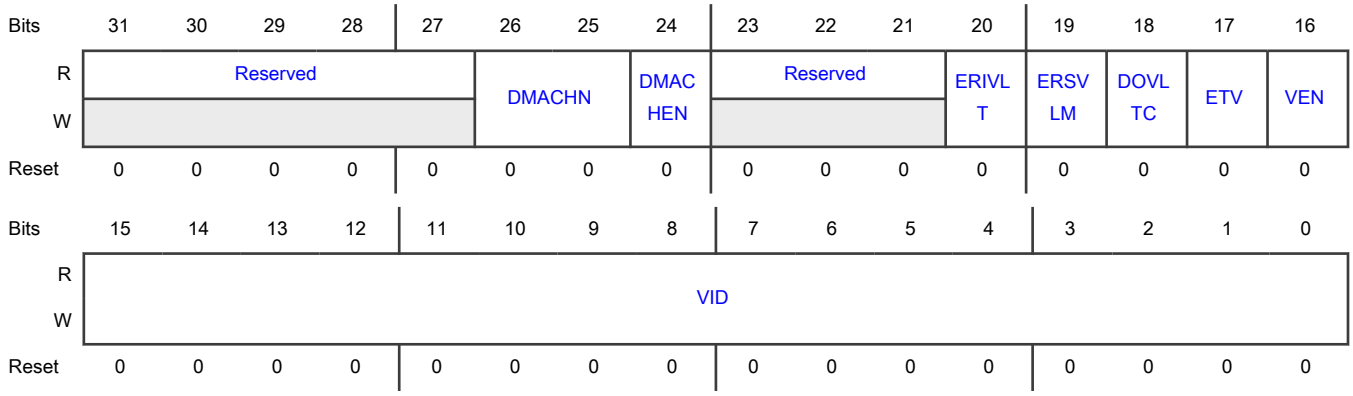
Offset

Register	Offset
MAC_VLAN_Tag_Filter17	54h

Function

This register contains VLAN Tag filter 17 control information.

Diagram



Fields

Field	Function
31-27 —	Reserved
26-25 DMACHN	DMA Channel Number The DMA Channel number to which the VLAN Tagged Frame is to be routed if it passes this VLAN Tag Filter is programmed in this field. If the Routing based on VLAN Tag Filter is not necessary, this field need not be programmed.
24 DMACHEN	DMA Channel Number Enable This bit is the Enable for the DMA Channel Number value programmed in the field DMACH. When this bit is reset, the Routing does not occur based on VLAN Filter result. The frame is routed based on DA Based DMA Channel Routing. 0b - DMA Channel Number is disabled 1b - DMA Channel Number is enabled
23-21 —	Reserved
20 ERIVLT	Enable Inner VLAN Tag Comparison This bit is valid only when Double VLAN Tag Enable of the Filter is set. When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). 0b - Inner VLAN tag comparison is disabled 1b - Inner VLAN tag comparison is enabled
19 ERSVLM	Enable S-VLAN Match for received Frames This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.

Table continues on the next page...

19 ERSVLM	Enable S-VLAN Match for received Frames This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Receive S-VLAN Match is disabled 1b - Receive S-VLAN Match is enabled
18 DOVLTC	Disable VLAN Type Comparison This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC does not check whether the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC filters or matches the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit only when VLAN Tag type is similar to the one specified by the Enable S-VLAN Match for received Frames bit. 0b - VLAN type comparison is enabled 1b - VLAN type comparison is disabled
17 ETV	12bits or 16bits VLAN comparison This bit is valid only when VEN of the Filter is set. When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. 0b - 16 bit VLAN comparison 1b - 12 bit VLAN comparison
16 VEN	VLAN Tag Enable This bit is used to enable or disable the VLAN Tag. When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID. When this bit is reset, no comparison is performed irrespective of the programming of the other fields. 0b - VLAN Tag is disabled 1b - VLAN Tag is enabled
15-0 VID	VLAN Tag ID This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

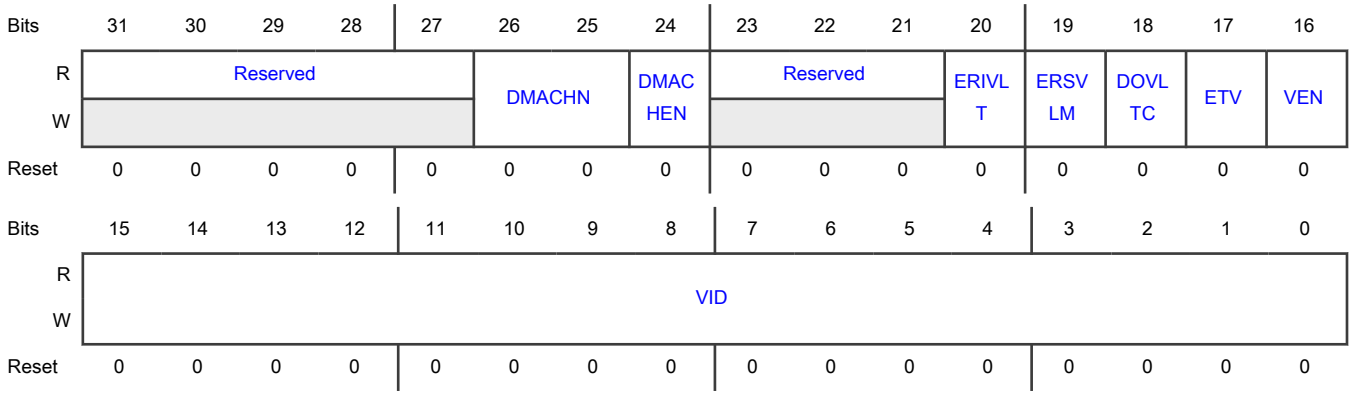
MAC_VLAN_Tag_Filter6	54h

Function
This register contains VLAN Tag filter 6 control information.

Diagram



Fields

Field	Function
31-27 —	Reserved
26-25 DMACHN	DMA Channel Number The DMA Channel number to which the VLAN Tagged Frame is to be routed if it passes this VLAN Tag Filter is programmed in this field. If the Routing based on VLAN Tag Filter is not necessary, this field need not be programmed.
24 DMACHEN	DMA Channel Number Enable This bit is the Enable for the DMA Channel Number value programmed in the field DMACH. When this bit is reset, the Routing does not occur based on VLAN Filter result. The frame is routed based on DA Based DMA Channel Routing. 0b - DMA Channel Number is disabled 1b - DMA Channel Number is enabled
23-21 —	Reserved
20 ERIVLT	Enable Inner VLAN Tag Comparison This bit is valid only when Double VLAN Tag Enable of the Filter is set. When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). 0b - Inner VLAN tag comparison is disabled 1b - Inner VLAN tag comparison is enabled
19 ERSVLM	Enable S-VLAN Match for received Frames This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Receive S-VLAN Match is disabled 1b - Receive S-VLAN Match is enabled
18 DOVLTC	Disable VLAN Type Comparison This bit is valid only when VLAN Tag Enable of the Filter is set. When this bit is set, the MAC does not check whether the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit is of type S-VLAN or C-VLAN. When this bit is reset, the MAC filters or matches the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit only when VLAN Tag type is similar to the one specified by the Enable S-VLAN Match for received Frames bit. 0b - VLAN type comparison is enabled 1b - VLAN type comparison is disabled
17 ETV	12bits or 16bits VLAN comparison This bit is valid only when VEN of the Filter is set. When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. 0b - 16 bit VLAN comparison 1b - 12 bit VLAN comparison
16 VEN	VLAN Tag Enable This bit is used to enable or disable the VLAN Tag. When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID. When this bit is reset, no comparison is performed irrespective of the programming of the other fields. 0b - VLAN Tag is disabled 1b - VLAN Tag is enabled
15-0 VID	VLAN Tag ID This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

76.17.48 MAC VLAN Hash Table (MAC_VLAN_Hash_Table)

Offset

Register	Offset
MAC_VLAN_Hash_Table	58h

Function

When VTHM bit of the MAC_VLAN_Tag register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag. For hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of MAC_VLAN_Tag Register) in the incoming packet is passed through the CRC logic. The upper four bits of the calculated CRC value are used to index the contents of the VLAN Hash table. For example, hash value of 4b'1000 selects Bit 8 of the VLAN Hash table. The hash value of the destination address is calculated in the following way: - Calculate the 32-bit CRC for the

VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3). - Perform bitwise reversal for the value obtained in step 1. - Take the upper four bits from the value obtained in step 2. If the VLAN hash Table register is configured to be double-synchronized to the (G)MII clock domain, the synchronization is triggered only when Bits[15:8] (in little-endian mode) or Bits[7:0] (in big-endian mode) of this register are written. - If double-synchronization is enabled, consecutive writes to this register should be performed after at least four clock cycles in the destination clock domain.

76.17.49 MAC VLAN Inclusion Or Replacement (MAC_VLAN_Incl)

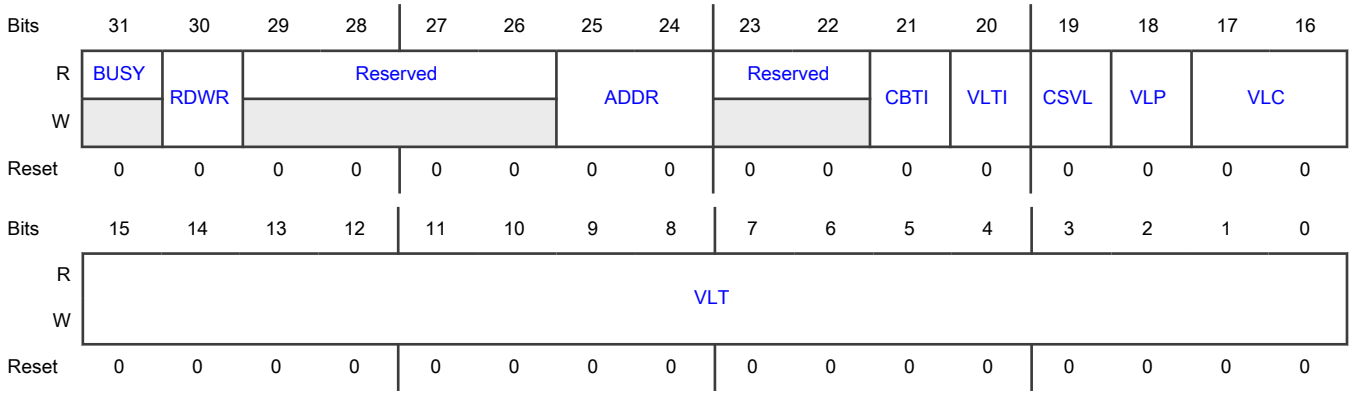
Offset

Register	Offset
MAC_VLAN_Incl	60h

Function

The VLAN Tag Inclusion or Replacement register contains the VLAN tag for insertion or replacement in the Transmit packets. It also contains the VLAN tag insertion controls.

Diagram



Fields

Field	Function
31 BUSY	Busy This bit indicates the status of the read/write operation of indirect access to the queue/channel specific VLAN inclusion register. For write operation write to a register is complete when this bit is reset. For read operation the read data is valid when the bit is reset. The application must make sure that this bit is reset before attempting subsequent access to this register. 0b - Busy status not detected 1b - Busy status detected
30 RDWR	Read write control This bit controls the read or write operation for indirectly accessing the queue/channel specific VLAN Inclusion register. When set indicates write operation and when reset indicates read operation. This does not have any effect when CBTI is reset. 0b - Read operation of indirect access 1b - Write operation of indirect access
29-26 —	Reserved
25-24 ADDR	Address This field selects one of the queue/channel specific VLAN Inclusion register for read/write access. This does not have any effect when CBTI is reset.
23-22 —	Reserved
21 CBTI	Channel based tag insertion When this bit is set, outer VLAN tag is inserted for every packets transmitted by the MAC. The tag value is taken from the queue/channel specific VLAN tag register. The VLTI, VLP, VLC, and VLT fields of this register are ignored when this bit is set. When this bit is set, a write operation to byte 3 of this register

Table continues on the next page...

Table continued from the previous page...

Field	Function
	initiates the read/write access to the indirect register. When reset, outer VLAN operation is based on the setting of VLTI, VLP, VLC and VLT fields of this register. 0b - Channel based tag insertion is disabled 1b - Channel based tag insertion is enabled
20 VLTI	VLAN Tag Input When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from: - The Tx descriptor 0b - VLAN Tag Input is disabled 1b - VLAN Tag Input is enabled
19 CSVL	C-VLAN or S-VLAN When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets. 0b - C-VLAN type (0x8100) is inserted or replaced 1b - S-VLAN type (0x88A8) is inserted or replaced
18 VLP	VLAN Priority Control When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, the mti_vlan_ctrl_i control input is used and bits[17:16] are ignored. 0b - VLAN Priority Control is disabled 1b - VLAN Priority Control is enabled
17-16 VLC	VLAN Tag Control in Transmit Packets - 2'b00: No VLAN tag deletion, insertion, or replacement - 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags. - 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. - 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 00b - No VLAN tag deletion, insertion, or replacement 01b - VLAN tag deletion 10b - VLAN tag insertion 11b - VLAN tag replacement
15-0 VLT	VLAN Tag for Transmit Packets

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: - Bits[15:13]: User Priority - Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) - Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

76.17.50 MAC VLAN Inclusion 0 (MAC_VLAN_Incl0)

31-20 —	Reserved
19 CSVL	C-VLAN or S-VLAN When this bit is set, S-VLAN type (0x88A8) is inserted in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted in the 13th and 14th bytes of transmitted packets. 0b - C-VLAN type (0x8100) is inserted 1b - S-VLAN type (0x88A8) is inserted
18-16 —	Reserved
15-0 VLT	VLAN Tag for Transmit Packets This field contains the value of the VLAN tag to be inserted. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: - Bits[15:13]: User Priority - Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) - Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

76.17.58 Inner VLAN Tag Inclusion Or Replacement (MAC_Inner_VLAN_Incl)

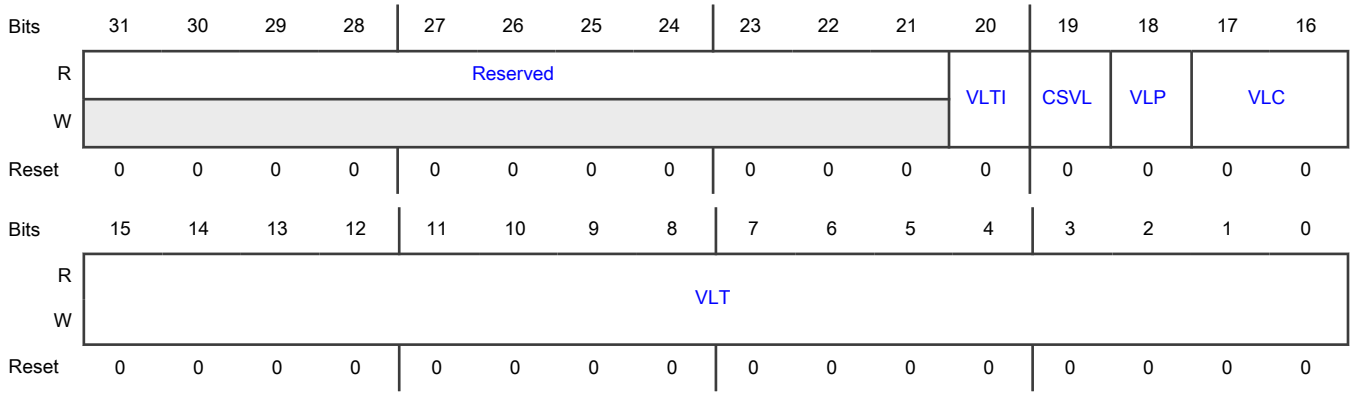
Offset

Register	Offset
MAC_Inner_VLAN_Incl	64h

Function

The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls.

Diagram



Fields

Field	Function
31-21 —	Reserved
20 VLTI	VLAN Tag Input When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from: - The Tx descriptor 0b - VLAN Tag Input is disabled 1b - VLAN Tag Input is enabled
19 CSVL	C-VLAN or S-VLAN When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 17th and 18th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 17th and 18th bytes of transmitted packets. 0b - C-VLAN type (0x8100) is inserted 1b - S-VLAN type (0x88A8) is inserted
18 VLP	VLAN Priority Control When this bit is set, the VLC field is used for VLAN deletion, insertion, or replacement. When this bit is reset, the mti_vlan_ctrl_i control input is used and the VLC field is ignored. 0b - VLAN Priority Control is disabled 1b - VLAN Priority Control is enabled
17-16 VLC	VLAN Tag Control in Transmit Packets - 2'b00: No VLAN tag deletion, insertion, or replacement - 2'b01: VLAN tag deletion The MAC removes the VLAN type (bytes 17 and 18) and VLAN tag (bytes 19 and 20) of all transmitted packets with VLAN tags. - 2'b10: VLAN tag insertion The MAC inserts VLT in bytes 19 and 20 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 17 and 18. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag. - 2'b11: VLAN tag replacement The MAC replaces VLT in bytes 19 and 20 of all VLAN-type transmitted packets (Bytes 17 and 18 are 0x8100 or 0x88a8). Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value. 00b - No VLAN tag deletion, insertion, or replacement 01b - VLAN tag deletion 10b - VLAN tag insertion 11b - VLAN tag replacement
15-0 VLT	VLAN Tag for Transmit Packets This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase. Bits[15:13] are the User Priority field, Bit 12 is the CFI/DEI field, and Bits[11:0] are the VID field in the VLAN tag. The following list describes the bits of this field: - Bits[15:13]: User Priority - Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI) - Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

76.17.59 MAC Q0 Tx Flow Control (MAC_Q0_Tx_Flow_Ctrl)

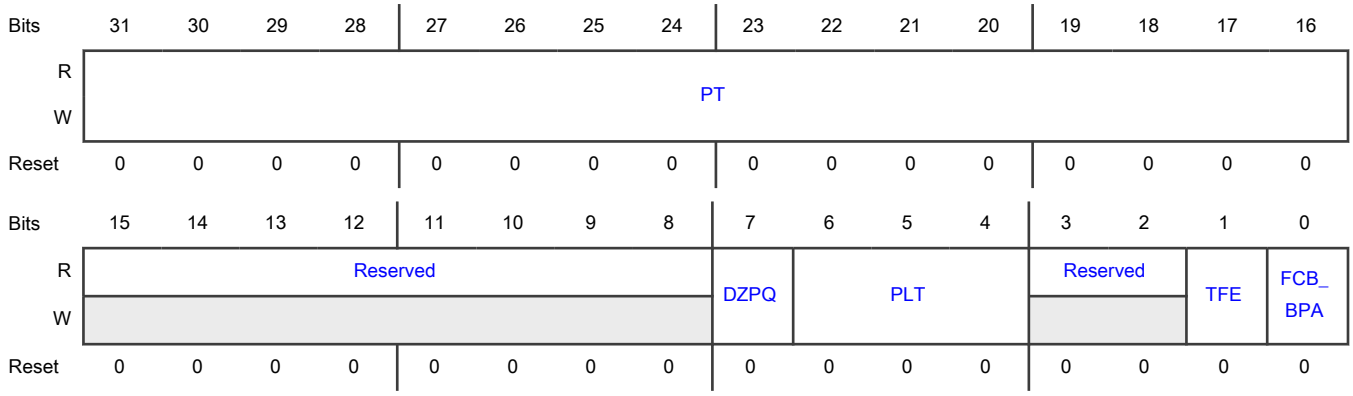
Offset

Register	Offset
MAC_Q0_Tx_Flow_Ctrl	70h

Function

The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC. A Write to a register with the Busy bit set to 1 triggers the Flow Control block to generate a Pause packet. The fields of the control packet are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control packet. The Busy bit remains set until the control packet is transferred onto the cable. The application must make sure that the Busy bit is cleared before writing to the register. When the PFCE bit in the MAC_Rx_Flow_Ctrl register is enabled, this register controls the generation of Priority Flow Control (PFC) frames with priorities mapped according to PSRQ0 in the MAC_RxQ_Ctrl2 register.

Diagram



Fields

Field	Function
31-16 PT	Pause Time This field holds the value to be used in the Pause Time field in the Tx control packet. If the Pause Time bits are configured to be double-synchronized to the (G)MII clock domain, consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain.
15-8 —	Reserved
7 DZPQ	Disable Zero-Quanta Pause When this bit is set, it disables the automatic generation of the zero-quanta Pause packets on de-assertion of the flow-control signal from the FIFO layer (MTL or external sideband flow control signal sbd_flowctrl_i or mti_flowctrl_i). When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Zero-Quanta Pause packet generation is enabled 1b - Zero-Quanta Pause packet generation is disabled
6-4 PLT	Pause Low Threshold This field configures the threshold of the Pause timer at which the input flow control signal mti_flowctrl_i (or sbd_flowctrl_i) is checked for automatic retransmission of the Pause packet. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted if the mti_flowctrl_i signal is asserted at 228 (256-28) slot times after the first Pause packet is transmitted. The following list provides the threshold values for different values. The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface. This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times. 000b - Pause Time minus 4 Slot Times (PT -4 slot times) 001b - Pause Time minus 28 Slot Times (PT -28 slot times) 010b - Pause Time minus 36 Slot Times (PT -36 slot times) 011b - Pause Time minus 144 Slot Times (PT -144 slot times) 100b - Pause Time minus 256 Slot Times (PT -256 slot times) 101b - Pause Time minus 512 Slot Times (PT -512 slot times) 110b - Reserved
3-2 —	Reserved
1 TFE	Transmit Flow Control Enable Full-Duplex Mode: In the full-duplex mode, when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets. Half-Duplex Mode: In the half-duplex mode, when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled. 0b - Transmit Flow Control is disabled 1b - Transmit Flow Control is enabled
0 FCB_BPA	Flow Control Busy or Backpressure Activate This bit initiates a Pause packet in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. Full-Duplex Mode: In the full-duplex mode, this bit should be read as 1'b0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1'b1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 1'b0. You should not write to this register until this bit is cleared. Half-Duplex Mode: When this bit is set (and TFE bit is set) in the half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. This control register bit is logically ORed with the mti_flowctrl_i input signal for the backpressure function. When the MAC is

76.17.62 MAC Receive Flow Control (MAC_Rx_Flow_Ctrl)

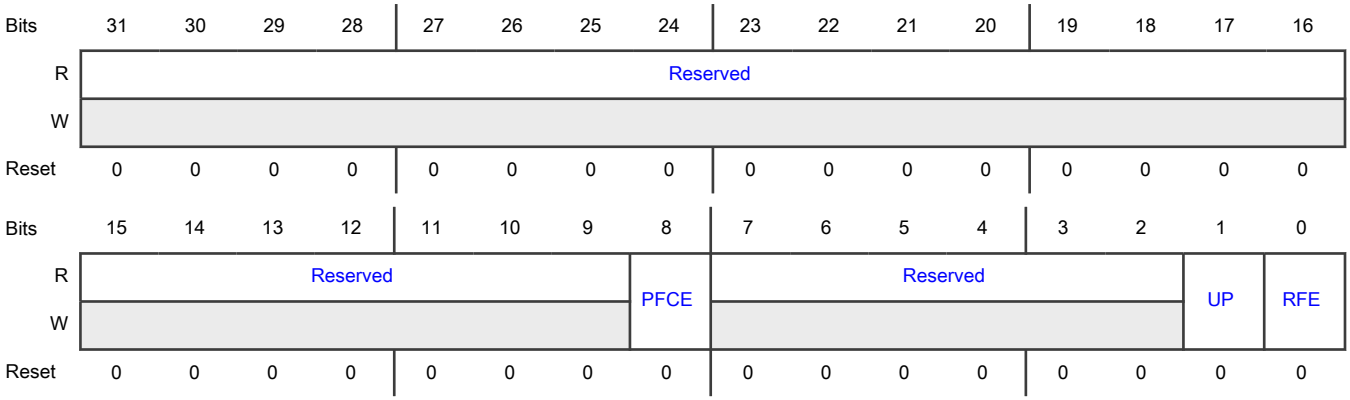
Offset

Register	Offset
MAC_Rx_Flow_Ctrl	90h

Function

The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 PFCE	Priority Based Flow Control Enable When this bit is set, it enables generation and reception of priority-based flow control (PFC) packets. When this bit is reset, it enables generation and reception of 802.3x Pause control packets. 0b - Priority Based Flow Control is disabled 1b - Priority Based Flow Control is enabled
7-2 —	Reserved
1 UP	Unicast Pause Packet Detect A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in MAC_Address0_High and MAC_Address0_Low. When this bit is reset, the MAC only detects Pause packets with unique multicast address. Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is

Table continues on the next page...

Table continued from the previous page...

Field	Function
	also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01_80_C2_00_00_01) is as specified in IEEE 802.1 Qbb-2011. 0b - Unicast Pause Packet Detect disabled 1b - Unicast Pause Packet Detect enabled
0 RFE	Receive Flow Control Enable When this bit is set and the MAC is operating in full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in half-duplex mode, the decode function of the Pause packet is disabled. When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time. 0b - Receive Flow Control is disabled 1b - Receive Flow Control is enabled

76.17.63 MAC Rx Queue Control 4 (MAC_RxQ_Ctrl4)

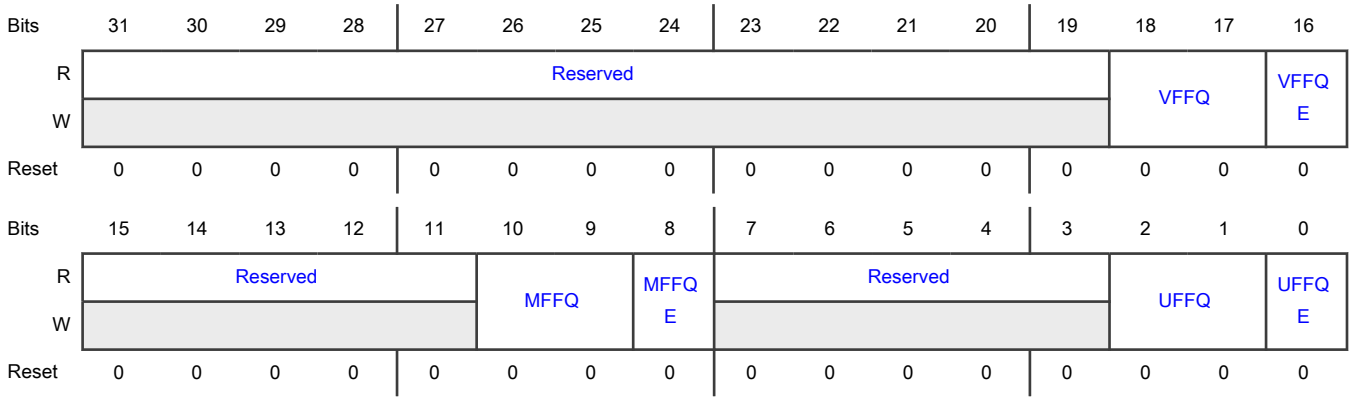
Offset

Register	Offset
MAC_RxQ_Ctrl4	94h

Function

The Receive Queue Control 4 register controls the routing of unicast and multicast packets that fail the Destination or Source address filter to the Rx queues.

Diagram



Fields

Field	Function
31-19 —	Reserved
18-17 VFFQ	VLAN Tag Filter Fail Packets Queue This field holds the Rx queue number to which the tagged packets failing the Destination or Source Address filter (and UFFQE/MFFQE not enabled) or failing the VLAN tag filter must be routed to. This field is valid only when the VFFQE bit is set.
16 VFFQE	VLAN Tag Filter Fail Packets Queuing Enable When this bit is set, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter, are routed to the Rx Queue Number programmed in the VFFQ. When this bit is reset, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter are routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set. 0b - VLAN tag Filter Fail Packets Queuing is disabled 1b - VLAN tag Filter Fail Packets Queuing is enabled
15-11 —	Reserved
10-9 MFFQ	Multicast Address Filter Fail Packets Queue. This field holds the Rx queue number to which the Multicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the MFFQE bit is set.
8 MFFQE	Multicast Address Filter Fail Packets Queuing Enable. When this bit is set, the Multicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the MFFQ. When this bit is reset, the Multicast packets which fail the Destination or Source address filter is routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set. 0b - Multicast Address Filter Fail Packets Queuing is disabled 1b - Multicast Address Filter Fail Packets Queuing is enabled
7-3 —	Reserved
2-1 UFFQ	Unicast Address Filter Fail Packets Queue. This field holds the Rx queue number to which the Unicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the UFFQE bit is set.
0 UFFQE	Unicast Address Filter Fail Packets Queuing Enable. When this bit is set, the Unicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the UFFQ. When this bit is reset, the Unicast packets which fail the Destination or Source address filter is routed based on other routing options. This bit is valid only when the RA bit of the MAC_Packet_Filter register is set.

76.17.64 MAC Tx Queue Parity Map 0 (MAC_TxQ_Prty_Map0)

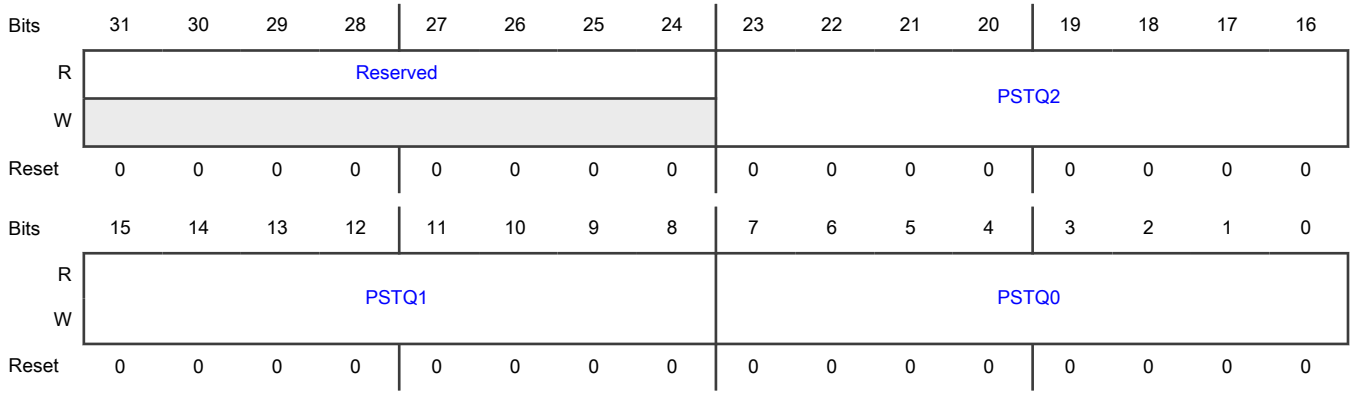
Offset

Register	Offset
MAC_TxQ_Prty_Map0	98h

Function

The Transmit Queue Priority Mapping 0 register contains the priority values assigned to Tx Queue 0 through Tx Queue 3.

Diagram



Fields

Field	Function
31-24 —	Reserved
23-16 PSTQ2	Priorities Selected in Transmit Queue 2 This bit is similar to the PSTQ0 bit.
15-8 PSTQ1	Priorities Selected in Transmit Queue 1 This bit is similar to the PSTQ0 bit.
7-0 PSTQ0	Priorities Selected in Transmit Queue 0

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field holds the priorities assigned to Tx Queue 0 by the software. This field determines if Tx Queue 0 should be blocked from transmitting specified pause time when a PFC packet is received with priorities matching the priorities programmed in this field. If the content of this field is not mutually exclusive to the corresponding fields of other Transmit queues, that is, same priority is mapped to multiple Tx queues, the MAC blocks all queues with matching priority, for the specified time.

76.17.65 MAC Rx Queue Control 0 (MAC_RxQ_Ctrl0)

Offset

Register	Offset
MAC_RxQ_Ctrl0	A0h

Function

The Receive Queue Control 0 register controls the queue management in the MAC Receiver. Note: In multiple Rx queues configuration, all the queues are disabled by default. Enable the Rx queue by programming the corresponding field in this register.

76.17.66 MAC Rx Queue Control 1 (MAC_RxQ_Ctrl1)

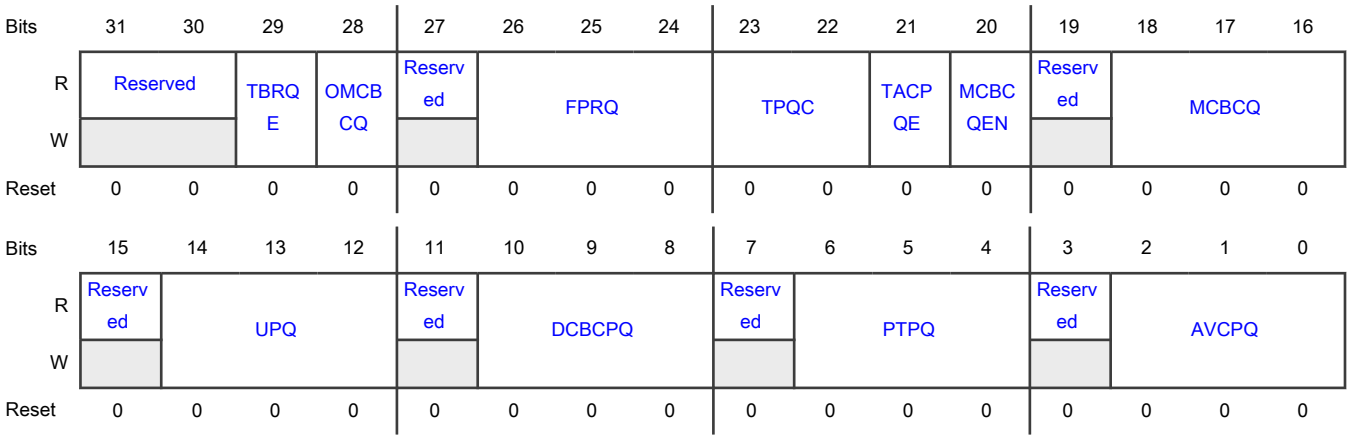
Offset

Register	Offset
MAC_RxQ_Ctrl1	A4h

Function

The Receive Queue Control 1 register controls the routing of multicast, broadcast, AV, DCB, and untagged packets to the Rx queues.

Diagram



Fields

Field	Function
31-30 —	Reserved
29 TBRQE	Type Field Based Rx Queuing Enable When this bit is set, it enables Type Field based Rx Queuing where the Type field of received packet is compared with programmed TYP field in MAC_TMRQ_Regs(#i) and if a match occurs the packet is routed to the corresponding TMRQ field.
28 OMCBCQ	Over-riding MC-BC queue priority select - 1: Priority of MCBCQ is reduced and the received packet is first routed to PTPQ, AVCPQ, DCBCPQ depending on packet type. - 0: Received Multicast/Broadcast packet is routed to MCBCQ. 0b - overriding MCBCQ priority disabled 1b - overriding MCBCQ priority enabled
27 —	Reserved
26-24 FPRQ	Frame Preemption Residue Queue This field holds the Rx queue number to which the residual preemption frames must be forwarded. Preemption frames that are tagged and pass the SA/DA/VLAN filtering are routed based on PSRQ and all other frames are treated as residual frames and is routed to the queue number mentioned in this field. The Queue-0 is used as a default queue for express frames, so this field cannot be programmed to a value 0.
23-22	Tagged PTP over Ethernet Packets Queuing Control.

Table continues on the next page...

Table continued from the previous page...

Field	Function
TPQC	This field controls the routing of the VLAN Tagged PTPoE packets. If DWC_EQOS_AV_ENABLE is selected in the configuration, the following programmable options are allowed. - 2'b00: VLAN Tagged PTPoE packets are routed as generic VLAN Tagged packet (based on PSRQ for only non-AV enabled Rx Queues). - 2'b01: VLAN Tagged PTPoE packets are routed to Rx Queue specified by PTPQ field (That Rx Queue can be enabled for AV or non-AV traffic). - 2'b10: VLAN Tagged PTPoE packets are routed to only AV enabled Rx Queues based on PSRQ. - 2'b11: Reserved If DWC_EQOS_AV_ENABLE is not selected in the configuration, the following programmable options are allowed. - 1'b0: VLAN Tagged PTPoE packets are routed as generic VLAN Tagged packet (based on PSRQ for DCB/Generic enabled Rx Queues). - 1'b1: VLAN Tagged PTPoE packets are routed to Rx Queues specified by PTPQ field.
21 TACPQE	Tagged AV Control Packets Queuing Enable. When set, the MAC routes the received Tagged AV Control packets to the Rx queue specified by AVCPQ field. When reset, the MAC routes the received Tagged AV Control packets based on the tag priority matching the PSRQ fields in MAC_RxQ_Ctrl2 and MAC_RxQ_Ctrl3 registers. 0b - Tagged AV Control Packets Queuing is disabled 1b - Tagged AV Control Packets Queuing is enabled
20 MCBCQEN	Multicast and Broadcast Queue Enable This bit specifies that Multicast or Broadcast packets routing to the Rx Queue is enabled and the Multicast or Broadcast packets must be routed to Rx Queue specified in MCBCQ field. 0b - Multicast and Broadcast Queue is disabled 1b - Multicast and Broadcast Queue is enabled
19 —	Reserved
18-16 MCBCQ	Multicast and Broadcast Queue This field specifies the Rx Queue onto which Multicast or Broadcast Packets are routed. Any Rx Queue enabled for Generic/DCB/AV traffic can be used to route the Multicast or Broadcast Packets. 000b - Receive Queue 0 001b - Receive Queue 1 010b - Receive Queue 2 011b - Receive Queue 3 100b - Receive Queue 4 101b - Receive Queue 5 110b - Receive Queue 6 111b - Receive Queue 7

	010b - Receive Queue 2 011b - Receive Queue 3 100b - Receive Queue 4 101b - Receive Queue 5 110b - Receive Queue 6 111b - Receive Queue 7
3 —	Reserved
2-0 AVCPQ	AV Untagged Control Packets Queue This field specifies the Receive queue on which the received AV tagged and untagged control packets are routed. The AV tagged (when TACPQE bit is set) and untagged control packets are routed to Receive queue specified by this field. 000b - Receive Queue 0 001b - Receive Queue 1 010b - Receive Queue 2 011b - Receive Queue 3 100b - Receive Queue 4 101b - Receive Queue 5 110b - Receive Queue 6 111b - Receive Queue 7

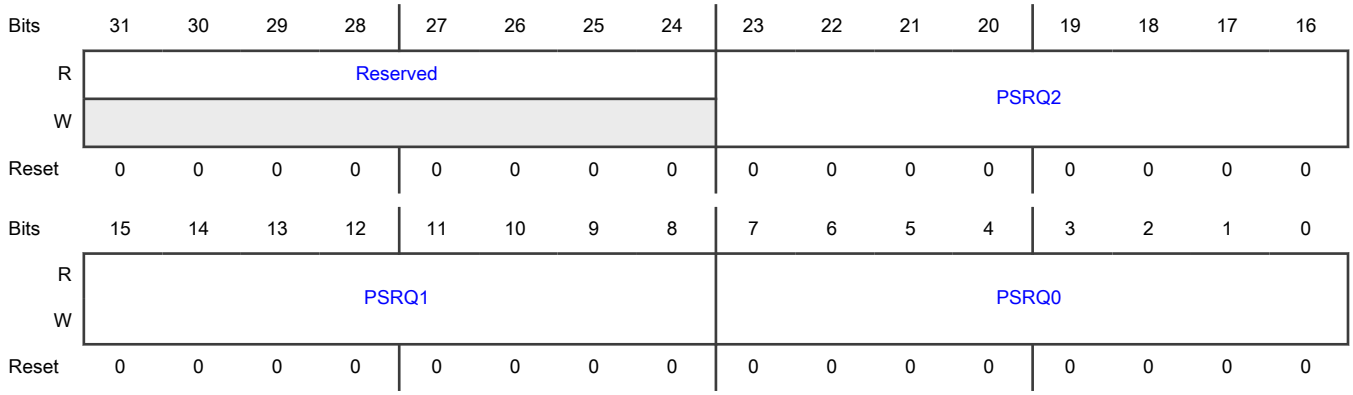
76.17.67 MAC Rx Queue Control 2 (MAC_RxQ_Ctrl2)

Offset

Register	Offset
MAC_RxQ_Ctrl2	A8h

Function
This register controls the routing of tagged packets based on the USP (user Priority) field of the received packets to the RxQueues 0 to 3.

Diagram



Fields

Field	Function
31-24 —	Reserved
23-16 PSRQ2	Priorities Selected in the Receive Queue 2 This field decides the priorities assigned to Rx Queue 2. All packets with priorities that match the values set in this field are routed to Rx Queue 2. For example, if PSRQ2[1, 0] are set, packets with USP field equal to 1 or 0 are routed to Rx Queue 2. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 2 crosses the flow control threshold settings.
15-8 PSRQ1	Priorities Selected in the Receive Queue 1 This field decides the priorities assigned to Rx Queue 1. All packets with priorities that match the values set in this field are routed to Rx Queue 1. For example, if PSRQ1[4] is set, packets with USP field equal to 4 are routed to Rx Queue 1. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 1 crosses the flow control threshold settings.
7-0 PSRQ0	Priorities Selected in the Receive Queue 0 This field decides the priorities assigned to Rx Queue 0. All packets with priorities that match the values set in this field are routed to Rx Queue 0. For example, if PSRQ0[5] is set, packets with USP field equal to 5 are routed to Rx Queue 0. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues. this field also determines the priorities to be included in the PFC packet sent to remote station when Rx Queue 0 crosses the flow control threshold settings.

76.17.68 MAC Interrupt Status (MAC_Interrupt_Status)

Offset

Register	Offset
MAC_Interrupt_Status	B0h

Function

The Interrupt Status register contains the status of interrupts.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-21 —	Reserved
20 MFRIS	MMC FPE Receive Interrupt Status This bit is set high when an interrupt is generated in the MMC FPE Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support. 0b - MMC FPE Receive Interrupt status not active 1b - MMC FPE Receive Interrupt status active
19 MFTIS	MMC FPE Transmit Interrupt Status This bit is set high when an interrupt is generated in the MMC FPE Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option along with FPE support. 0b - MMC FPE Transmit Interrupt status not active 1b - MMC FPE Transmit Interrupt status active

Table continues on the next page...

Table continued from the previous page...

Field	Function
18 MDIOIS	MDIO Interrupt Status This bit indicates an interrupt event after the completion of MDIO operation. To reset this bit, the application has to read this bit/Write 1 to this bit when RCWE bit of MAC_CSR_SW_Ctrl register is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - MDIO Interrupt status not active 1b - MDIO Interrupt status active
17 FPEIS	Frame Preemption Interrupt Status This bit indicates an interrupt event during the operation of Frame Preemption (Bits[19:16] of MAC_FPE_CTRL_STS register is set). To reset this bit, the application must clear the event in MAC_FPE_CTRL_STS that has caused the Interrupt. 0b - Frame Preemption Interrupt status not active 1b - Frame Preemption Interrupt status active
16 —	Reserved
15 —	Reserved
14 RXSTSIS	Receive Status Interrupt This bit indicates the status of received packets. This bit is set when the RWT bit is set in the MAC_Rx_Tx_Status register. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register. 0b - Receive Interrupt status not active 1b - Receive Interrupt status active
13 TXSTSIS	Transmit Status Interrupt This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the MAC_Rx_Tx_Status register: - Excessive Collision (EXCOL) - Late Collision (LCOL) - Excessive Deferral (EXDEF) - Loss of Carrier (LCARR) - No Carrier (NCARR) - Jabber Timeout (TJT) This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Rx_Tx_Status register. 0b - Transmit Interrupt status not active 1b - Transmit Interrupt status active
12 TSIS	Timestamp Interrupt Status If the Timestamp feature is enabled, this bit is set when any of the following conditions is true: - The system time value is equal to or exceeds the value specified in the Target Time High and Low registers. - There is an overflow in the Seconds register. - The Target Time Error occurred, that

Table continues on the next page...

Table continued from the previous page...

Field	Function
	is, programmed target time already elapsed. In configurations other than EQOS_CORE, when drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the MAC_Tx_Timestamp_Status_Nanoseconds and Mac_TxTimestamp_Status_Seconds registers. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set) in the MAC_Timestamp_Status register. 0b - Timestamp Interrupt status not active 1b - Timestamp Interrupt status active
11 —	Reserved
10 MMCTXIS	MMC Transmit Interrupt Status This bit is set high when an interrupt is generated in the MMC Transmit Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0b - MMC Transmit Interrupt status not active 1b - MMC Transmit Interrupt status active
9 MMCRXIS	MMC Receive Interrupt Status This bit is set high when an interrupt is generated in the MMC Receive Interrupt Register. This bit is cleared when all bits in this interrupt register are cleared. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0b - MMC Receive Interrupt status not active 1b - MMC Receive Interrupt status active
8 MMCIS	MMC Interrupt Status This bit is set high when Bit 11, Bit 10, or Bit 9 is set high. This bit is cleared only when all these bits are low. This bit is valid only when you select the Enable MAC Management Counters (MMC) option. 0b - MMC Interrupt status not active 1b - MMC Interrupt status active
7-6 —	Reserved
5 —	Reserved
4 —	Reserved
3	PHY Interrupt

Table continues on the next page...

Table continued from the previous page...

Field	Function
PHYIS	This bit is set when rising edge is detected on the phy_intr_i input. This bit is cleared when this register is read (or this bit is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). 0b - PHY Interrupt not detected 1b - PHY Interrupt detected
2 —	Reserved
1 —	Reserved
0 RGSMIIIS	RGMII or SMII Interrupt Status This bit is set because of any change in value of the Link Status of RGMII or SMII interface (LNKSTS bit in MAC_PHYIF_Control_Status register). This bit is cleared when the MAC_PHYIF_Control_Status register is read (or LNKSTS bit of MAC_PHYIF_Control_Status register is written to 1 when RCWE bit of MAC_CSR_SW_Ctrl register is set). This bit is valid only when you select the optional RGMII or SMII PHY interface. 0b - RGMII or SMII Interrupt Status is not active 1b - RGMII or SMII Interrupt Status is active

76.17.69 MAC Interrupt Enable (MAC_Interrupt_Enable)

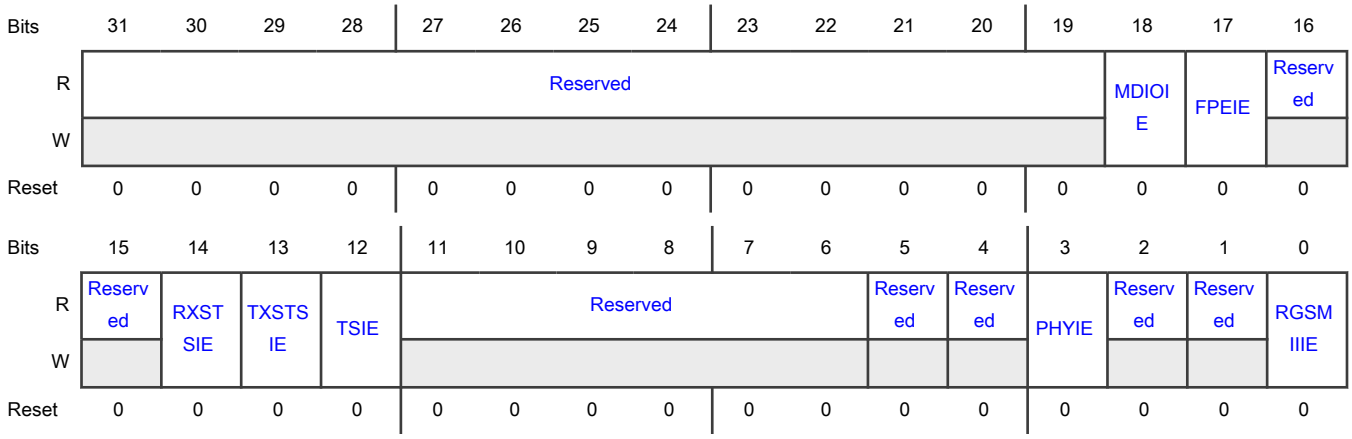
Offset

Register	Offset
MAC_Interrupt_Enable	B4h

Function

The Interrupt Enable register contains the masks for generating the interrupts.

Diagram



Fields

Field	Function
31-19 —	Reserved
18 MDIOIE	MDIO Interrupt Enable When this bit is set, it enables the assertion of the interrupt when MDIOIS field is set in the MAC_Interrupt_Status register. 0b - MDIO Interrupt is disabled 1b - MDIO Interrupt is enabled
17 FPEIE	Frame Preemption Interrupt Enable When this bit is set, it enables the assertion of the interrupt when FPEIS field is set in the MAC_Interrupt_Status register. 0b - Frame Preemption Interrupt is disabled 1b - Frame Preemption Interrupt is enabled
16 —	Reserved
15 —	Reserved
14 RXSTSIE	Receive Status Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the MAC_Interrupt_Status register. 0b - Receive Status Interrupt is disabled 1b - Receive Status Interrupt is enabled
13 TXSTSIE	Transmit Status Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the MAC_Interrupt_Status register. 0b - Timestamp Status Interrupt is disabled 1b - Timestamp Status Interrupt is enabled
12 TSIE	Timestamp Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in MAC_Interrupt_Status register. 0b - Timestamp Interrupt is disabled 1b - Timestamp Interrupt is enabled
11-6	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
5 —	Reserved
4 —	Reserved
3 PHYIE	PHY Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in MAC_Interrupt_Status register. 0b - PHY Interrupt is disabled 1b - PHY Interrupt is enabled
2 —	Reserved
1 —	Reserved
0 RGSMIIIE	RGMII or SMII Interrupt Enable When this bit is set, it enables the assertion of the interrupt signal because of the setting of RGSMIIIS bit in MAC_Interrupt_Status register. 0b - RGMII or SMII Interrupt is disabled 1b - RGMII or SMII Interrupt is enabled

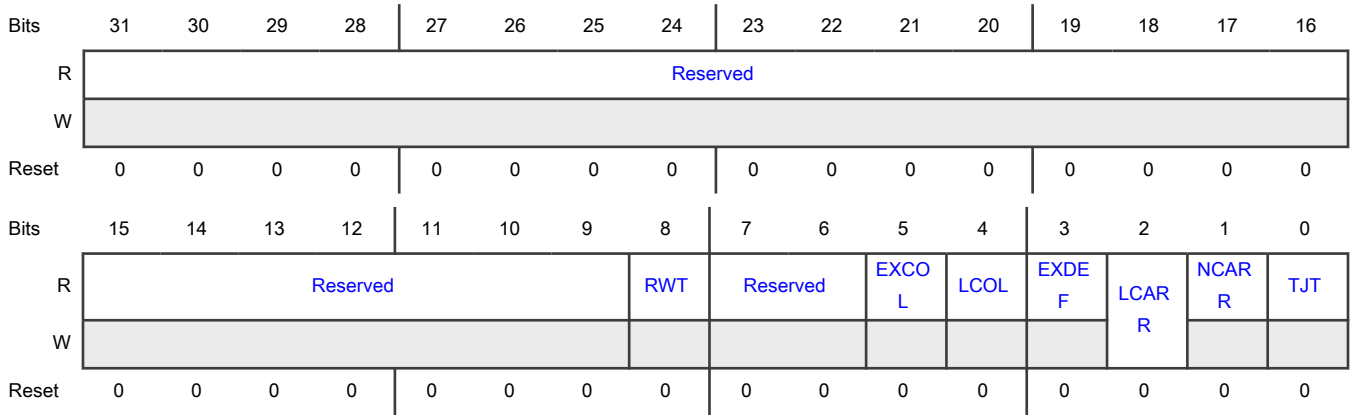
76.17.70 MAC Rx Transmit Status (MAC_Rx_Tx_Status)

Offset

Register	Offset
MAC_Rx_Tx_Status	B8h

Function
The Receive Transmit Status register contains the Receive and Transmit Error status.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 RWT	Receive Watchdog Timeout This bit is set when a packet with length greater than 2,048 bytes is received (10, 240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the MAC_Configuration register. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - No receive watchdog timeout 1b - Receive watchdog timed out
7-6 —	Reserved
5 EXCOL	Excessive Collisions When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the MAC_Configuration register, this bit is set after the first collision and the packet transmission is aborted. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - No collision 1b - Excessive collision is sensed
4 LCOL	Late Collision When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode). This bit

Table continues on the next page...

Table continued from the previous page...

Field	Function
	is not valid if the Underflow error occurs. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - No collision 1b - Late collision is sensed
3 EXDEF	Excessive Deferral When the DTXSTS bit is set in the MTL_Operation_Mode register and the DC bit is set in the MAC_Configuration register, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000/2500 Mbps mode or when Jumbo packet is enabled). Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - No Excessive deferral 1b - Excessive deferral
2 LCARR	Loss of Carrier When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the loss of carrier occurred during packet transmission, that is, the PHY_CRS_I signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Carrier is present 1b - Loss of carrier
1 NCARR	No Carrier When the DTXSTS bit is set in the MTL_Operation_Mode register, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Carrier is present 1b - No carrier
0 TJT	Transmit Jabber Timeout This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the MAC_Configuration register. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the MAC_Configuration register. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - No Transmit Jabber Timeout 1b - Transmit Jabber Timeout occurred

76.17.71 MAC Physical Interface Control Status (MAC_PHYIF_Control_Status)

Offset

Register	Offset
MAC_PHYIF_Control_Status	F8h

Function

The PHY Interface Control and Status register indicates the status signals received by the SGMII, RGMII, or SMII interface (selected at reset) from the PHY. This register is optional.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15-10 —	Reserved
9-0 TMR	CSR Clocks for 1us Tic This field indicates the number of CSR clocks required to generate 1us tic.

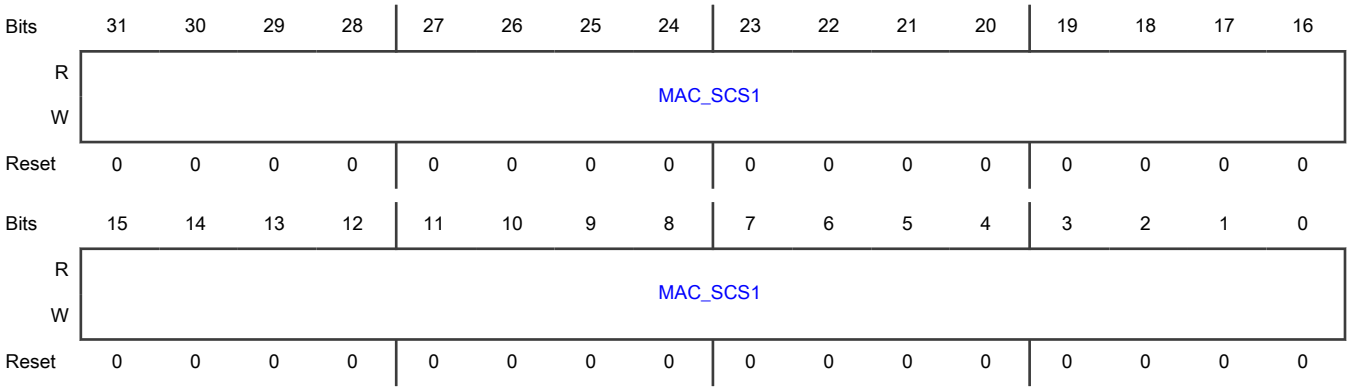
76.17.81 SCS REG 1 (SCS_REG1)

Offset

Register	Offset
SCS_REG1	150h

Function
NXP Reserved Register

Diagram



Fields

Field	Function
31-0 MAC_SCS1	MAC SCS 1 NXP Reserved, All the bits must be set to "0". This field is reserved for NXP Internal use, and must always be set to "0" unless instructed by NXP. Setting any bit to "1" might cause unexpected behavior in the IP.

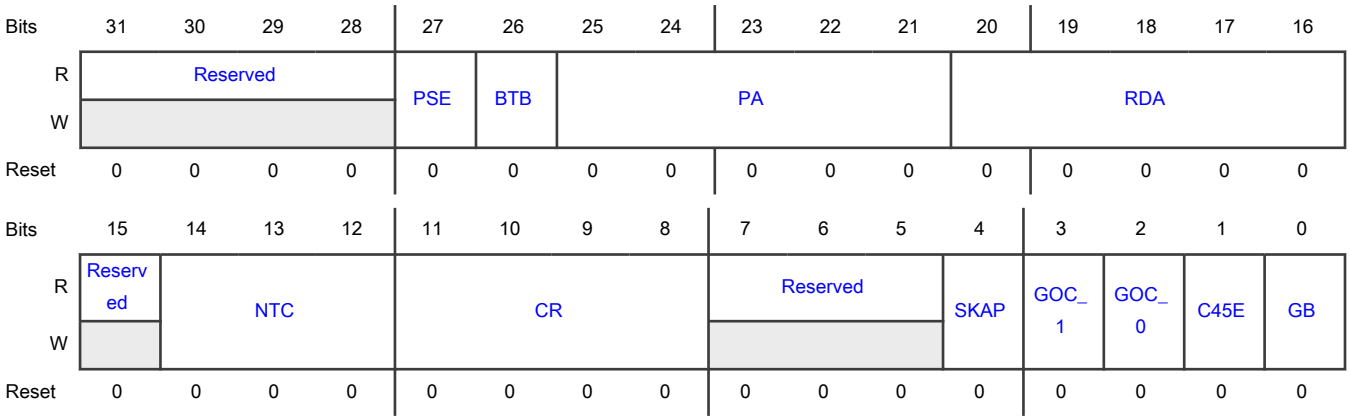
76.17.82 MAC MDIO Address (MAC_MDIO_Address)

Offset

Register	Offset
MAC_MDIO_Address	200h

Function
The MDIO Address register controls the management cycles to external PHY through a management interface.

Diagram



Fields

Field	Function
31-28 —	Reserved
27 PSE	Preamble Suppression Enable When this bit is set, the SMA suppresses the 32-bit preamble and transmits MDIO frames with only 1 preamble bit. When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications. 0b - Preamble Suppression disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Preamble Suppression enabled
26 BTB	Back to Back transactions When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame. When this bit is reset, then the read/write command completion (GB is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame. This bit must not be set when NTC=0. 0b - Back to Back transactions disabled 1b - Back to Back transactions enabled
25-21 PA	Physical Layer Address This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing. This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.
20-16 RDA	Register/Device Address These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.
15 —	Reserved
14-12 NTC	Number of Trailing Clocks This field controls the number of trailing clock cycles generated on GMII_MDC_O (MDC) after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 3'h3 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer. 000b - Loopback is disabled 001b - Loopback is enabled
11-8 CR	CSR Clock Range The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency used in your design: - 0000: CSR clock = 60-100 MHz; MDC clock = CSR clock/42 - 0001: CSR clock = 100-150 MHz; MDC clock = CSR clock/62 - 0010: CSR clock = 20-35 MHz; MDC clock = CSR clock/16 - 0011: CSR clock = 35-60 MHz; MDC clock = CSR clock/26 - 0100: CSR clock = 150-250 MHz; MDC clock = CSR clock/102 - 0101: CSR clock = 250-300 MHz; MDC clock = CSR clock/124 - 0110: CSR clock = 300-500 MHz; MDC clock = CSR clock/204 - 0111: CSR clock = 500-800 MHz; MDC clock = CSR clock/324 The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz frequency range. When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits as 1010, the resultant MDC clock is of 12.5 MHz which is beyond the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks: - 1000: CSR clock/4 - 1001: CSR clock/6 - 1010: CSR

Table continues on the next page...

Table continued from the previous page...

Field	Function
	clock/8 - 1011: CSR clock/10 - 1100: CSR clock/12 - 1101: CSR clock/14 - 1110: CSR clock/16 - 1111: CSR clock/18 These bits are not used for accessing RevMII. These bits are read-only if the RevMII interface is selected as single PHY interface.
7-5 —	Reserved
4 SKAP	Skip Address Packet When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set. 0b - Skip Address Packet is disabled 1b - Skip Address Packet is enabled
3 GOC_1	GMII Operation Command 1 This bit is higher bit of the operation command to the PHY or RevMII, GOC_1 and GOC_O is encoded as follows: - 00: Reserved - 01: Write - 10: Post Read Increment Address for Clause 45 PHY - 11: Read When Clause 22 PHY or RevMII is enabled, only Write and Read commands are valid. 0b - GMII Operation Command 1 is disabled 1b - GMII Operation Command 1 is enabled
2 GOC_0	GMII Operation Command 0 This is the lower bit of the operation command to the PHY or RevMII. When in SMA mode (MDIO master) this bit along with GOC_1 determines the operation to be performed to the PHY. When only RevMII is selected in configuration this bit is read-only and tied to 1. 0b - GMII Operation Command 0 is disabled 1b - GMII Operation Command 0 is enabled
1 C45E	Clause 45 PHY Enable When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO. 0b - Clause 45 PHY is disabled 1b - Clause 45 PHY is enabled
0 GB	GMII Busy The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIO slave. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in MAC_MDIO_Address and MAC_MDIO_Data registers as long as this bit is set. For write transfers, the application must first write 16-bit data in the GDI field (and also RA field when C45E is set) in MAC_MDIO_Data register before setting this bit. When C45E is set, it should also write into the RA field of MAC_MDIO_Data register before initiating a read transfer. When a read transfer is completed (GB=0), the data read from the PHY register is valid in the GD field of the MAC_MDIO_Data register. Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

Table continued from the previous page...

Field	Function
	0b - GMII Busy is disabled 1b - GMII Busy is enabled

76.17.83 MAC MDIO Data (MAC_MDIO_Data)

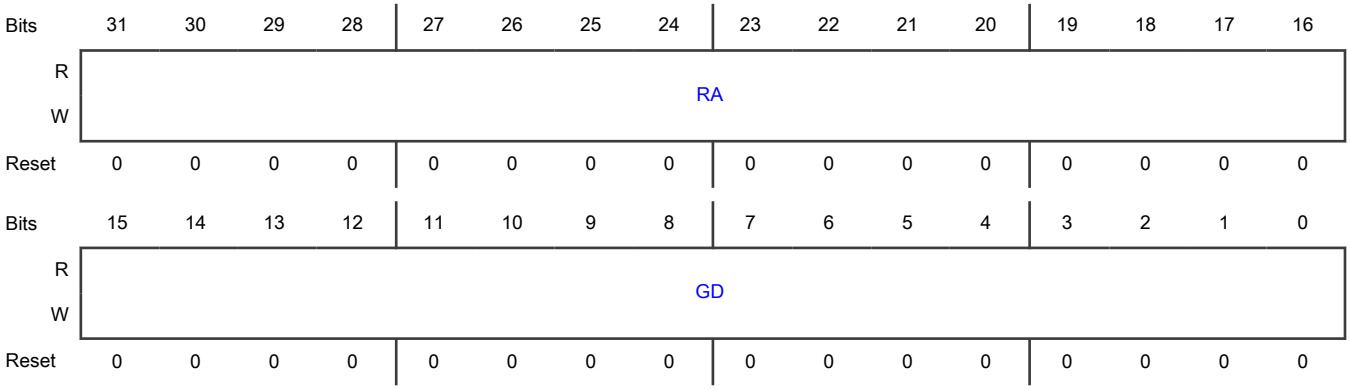
Offset

Register	Offset
MAC_MDIO_Data	204h

Function

The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in MAC_MDIO_Address. This register also stores the Read data from the PHY register located at the address specified by MDIO Address register.

Diagram



Fields

Field	Function
31-16 RA	Register Address This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.
15-0 GD	GMII Data This field contains the 16-bit data value read from the PHY or RevMII after a Management Read operation or the 16-bit data value to be written to the PHY or RevMII before a Management Write operation.

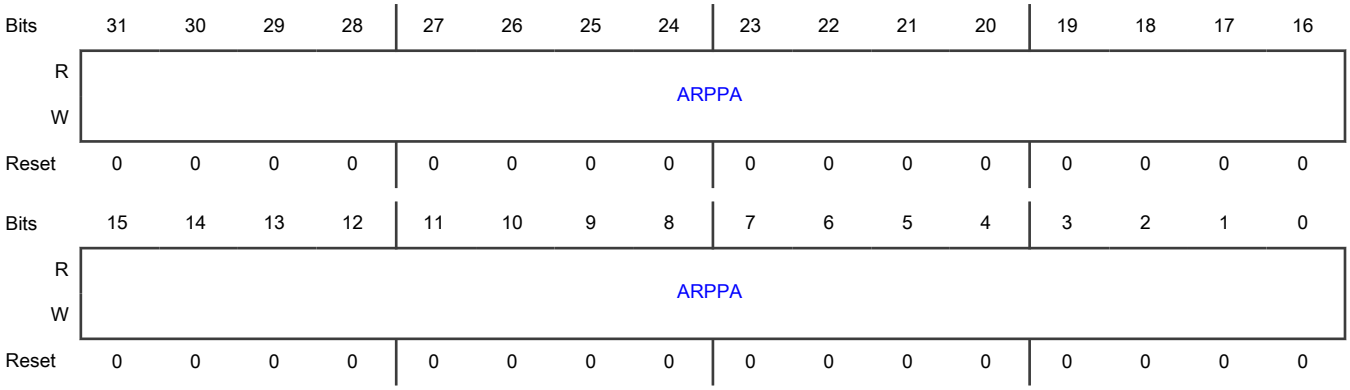
76.17.84 MAC ARP Address (MAC_ARP_Address)

Offset

Register	Offset
MAC_ARP_Address	210h

Function
The ARP Address register contains the IPv4 Destination Address of the MAC.

Diagram



Fields

Field	Function
31-0 ARPPA	ARP Protocol Address This field contains the IPv4 Destination Address of the MAC. This address is used for perfect match with the Protocol Address of Target field in the received ARP packet. This field is available only when the Enable IPv4 ARP Offload option is selected.

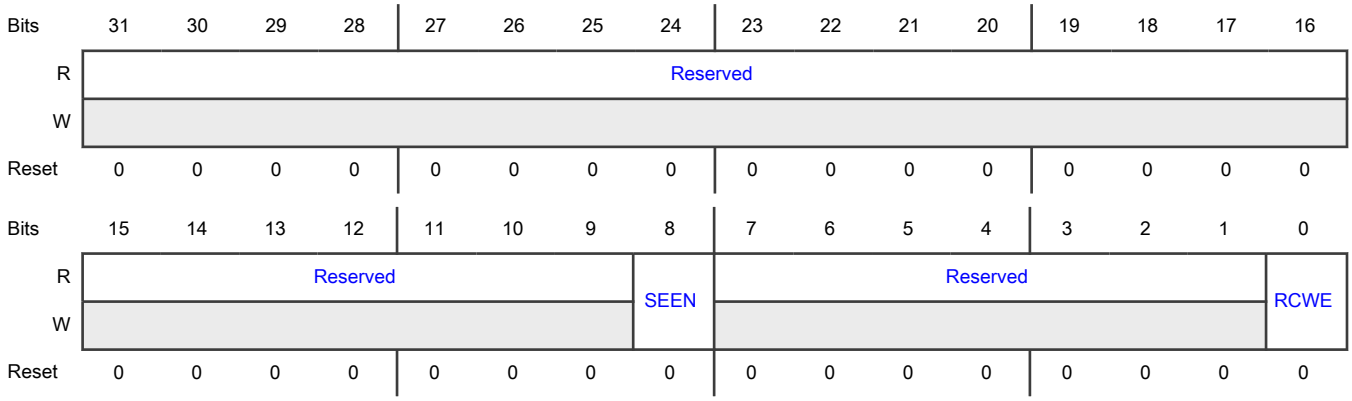
76.17.85 MAC CSR Software Control (MAC_CSR_SW_Ctrl)

Offset

Register	Offset
MAC_CSR_SW_Ctrl	230h

Function
This register contains software programmable controls for changing the CSR access response and status bits clearing.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 SEEN	Slave Error Response Enable When this bit is set, the MAC responds with Slave Error for accesses to reserved registers in CSR space. When this bit is reset, the MAC responds with Okay response to any register accessed from CSR space. 0b - Slave Error Response is disabled 1b - Slave Error Response is enabled
7-1 —	Reserved
0 RCWE	Register Clear on Write 1 Enable When this bit is set, the access mode of some register fields changes to Clear on Write 1, the application needs to set that respective bit to 1 to clear it. When this bit is reset, the access mode of these register fields remain as Clear on Read. 0b - Register Clear on Write 1 is disabled 1b - Register Clear on Write 1 is enabled

76.17.86 MAC FPE Control STS (MAC_FPE_CTRL_STS)

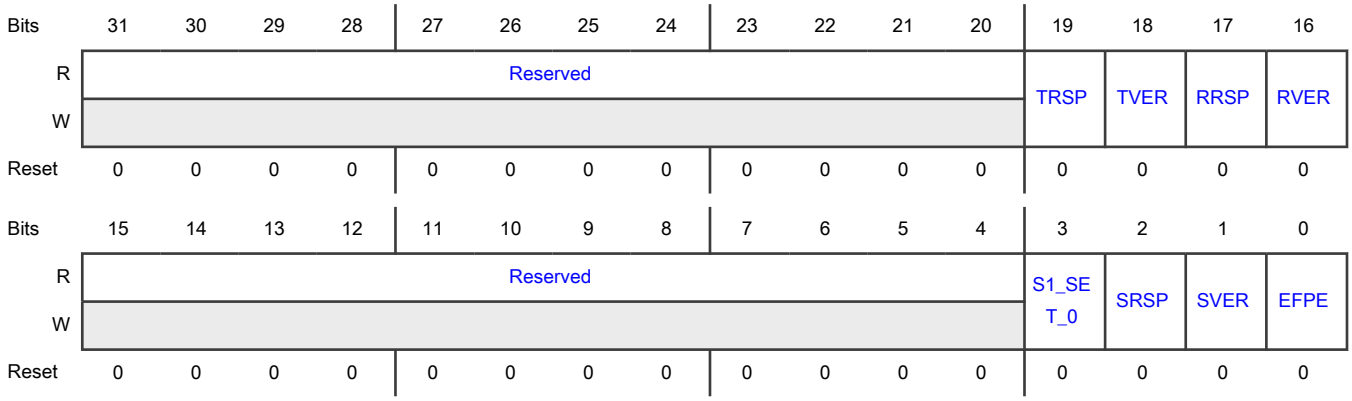
Offset

Register	Offset
MAC_FPE_CTRL_STS	234h

Function

This register controls the operation of Frame Preemption.

Diagram



Fields

Field	Function
31-20 —	Reserved
19 TRSP	Transmitted Respond Frame Set when a Respond mPacket is transmitted (triggered by setting SRSP field). An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Not transmitted Respond Frame 1b - transmitted Respond Frame
18 TVER	Transmitted Verify Frame Set when a Verify mPacket is transmitted (triggered by setting SVER field). An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Not transmitted Verify Frame 1b - transmitted Verify Frame
17 RRSP	Received Respond Frame Set when a Respond mPacket is received. An interrupt can be generated for this event if FPEIE bit of MAC_Interrupt_Enable is set. Access restriction applies. Clears on read (or write of 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Not received Respond Frame 1b - Received Respond Frame
16 RVER	Received Verify Frame

15-4 —	Reserved
3 S1_SET_0	S1 SET 0 NXP Reserved, Must be set to "0". This field is reserved for NXP Internal use, and must always be set to "0" unless instructed by NXP. Setting to "1" might cause unexpected behavior in the IP.
2 SRSP	Send Respond mPacket When set indicates hardware to send a Respond mPacket. Reset by hardware after sending the Respond mPacket. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Send Respond mPacket is disabled 1b - Send Respond mPacket is enabled
1 SVER	Send Verify mPacket When set indicates hardware to send a verify mPacket. Reset by hardware after sending the Verify mPacket. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Send Verify mPacket is disabled 1b - Send Verify mPacket is enabled
0 EFPE	Enable Tx Frame Preemption When set Frame Preemption Tx functionality is enabled. 0b - Tx Frame Preemption is disabled 1b - Tx Frame Preemption is enabled

76.17.87 MAC Extended Configuration 1 (MAC_Ext_Cfg1)

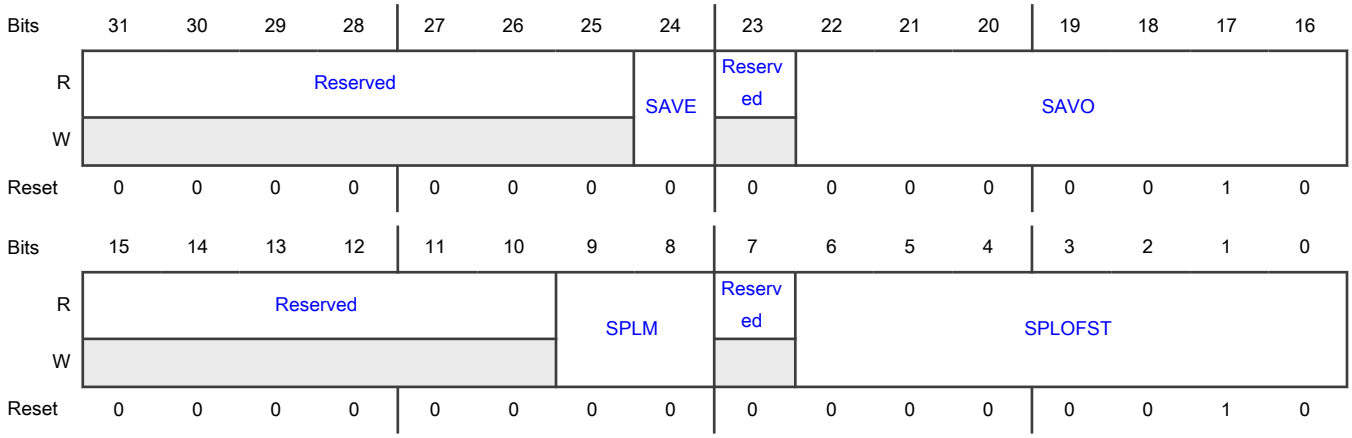
Offset

Register	Offset
MAC_Ext_Cfg1	238h

Function

This register contains Split mode control field and offset field for Split Header feature.

Diagram



Fields

Field	Function
31-25 —	Reserved
24 SAVE	Split AV Enable - When this bit is set to 1, and the received packet is an AV Type packet, the header is split at SAVO bytes from the beginning of Length/Type field of the packet, for L2 Split. - When this bit is set to 0, header is split at SPLOFST bytes from the beginning of Length/Type field of the frame, for L2 Split.
23 —	Reserved
22-16 SAVO	Split AV Offset When SAVE bit is set to 1, and the received packet is an AV Type packet, these bits indicate the value of the offset from the beginning of Length/Type field at which header should be split, when appropriate SPLM is selected. The reset value of this field is 2 bytes, indicating a split at L2 header. Value is in terms of bytes.
15-10 —	Reserved
9-8 SPLM	Split Mode These bits indicate the mode of splitting the incoming Rx packets. They are 00b - Split at L3/L4 header 01b - Split at L2 header with an offset. Always Split at SPLOFST bytes from the beginning of Length/Type field of the Frame 10b - Combination mode: Split similar to SPLM=00 for IP packets that are untagged or tagged and VLAN stripped 11b - Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
7 —	Reserved
6-0 SPLOFST	Split Offset These bits indicate the value of offset from the beginning of Length/Type field at which header split should take place when the appropriate SPLM is selected. The reset value of this field is 2 bytes indicating a split at L2 header. Value is in terms of bytes.

76.17.88 MAC Presentation Time (MAC_Presn_Time_ns)

Offset

Register	Offset
MAC_Presn_Time_ns	240h

Function

This register contains the 32-bit binary rollover equivalent time of the PTP System Time in ns Exists when DWC_EQOS_FLEXI_PPS_OUT_EN is configured

Diagram

76.17.89 MAC Presentation Time Update (MAC_Presn_Time_Updt)

Offset

Register	Offset
MAC_Presn_Time_Updt	244h

Function

This field holds the 32-bit value of MAC 1722 Presentation Time in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_Timestamp_ Control register). Exists when DWC_EQOS_FLEXI_PPS_OUT_EN is configured

Diagram

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 MPTU	MAC 1722 Presentation Time Update This field holds the init value or the update value for the presentation time. When used for update, this field holds the 32-bit value in ns, that should be added to the Current Presentation Time Counter value. Init happens when TSINIT is set, and update happens when the TSUPDT bit is set (TSINIT and TSINIT defined in MAC_Timestamp_ Control register). When ADDSUB field of MAC_System_Time_Nanoseconds_Update is set, this value is directly used for subtraction

76.17.90 MAC Address 0 High (MAC_Address0_High)

Offset

Register	Offset
MAC_Address0_High	300h

Function

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the (G)MII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x112233445566 is received (0x11 in lane 0 of the first column) on the (G)MII as the destination address, then

the MacAddress0 Register [47:0] is compared with 0x665544332211. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, then the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Diagram

Fields

Field	Function
31 AE	Address Enable This bit is always set to 1. 0b - INVALID : This bit must be always set to 1 1b - This bit is always set to 1
30-19 —	Reserved
18-16 DCS	DMA Channel Select If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address0 content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address0 content is routed.
15-0 ADDRHI	MAC Address0[47:32] This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

76.17.91 MAC Address 0 Low (MAC_Address0_Low)

Offset

Register	Offset
MAC_Address0_Low	304h

Function

The MAC Address0 Low register holds the lower 32 bits of the 6-byte first MAC address of the station.

Diagram

Fields

Field	Function
31-0 ADDRLO	MAC Address0[31:0] This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

76.17.92 MAC Address 1 High (MAC_Address1_High)

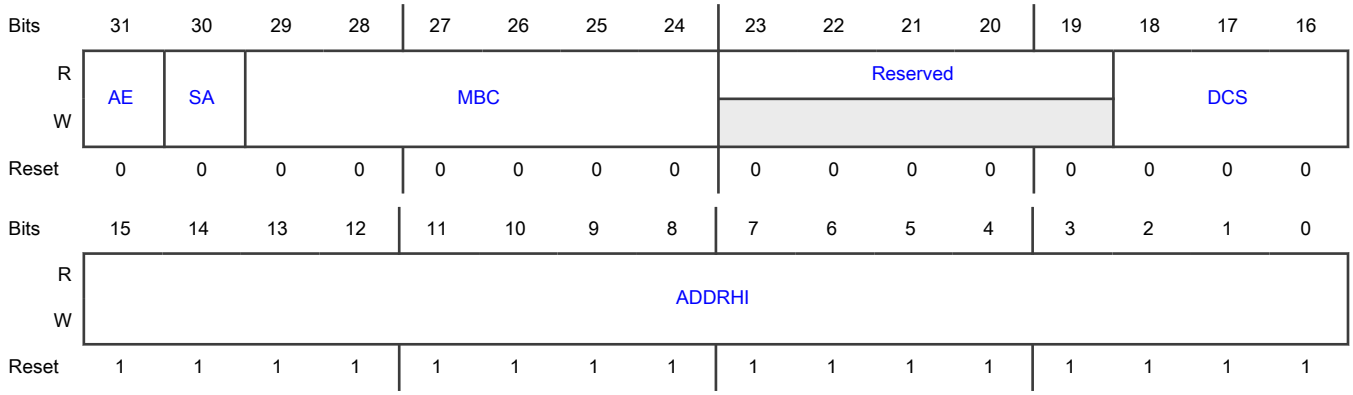
Offset

Register	Offset
MAC_Address1_High	308h

Function

The MAC Address1 High register holds the upper 16 bits of the second 6-byte MAC address of the station. If the MAC address registers are configured to be double-synchronized to the (G)MII clock domains, the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address1 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

Diagram



Fields

Field	Function
31 AE	Address Enable When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. 0b - Address is ignored 1b - Address is enabled
30 SA	Source Address When this bit is set, the MAC Address1[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address1[47:0] is used to compare with the DA fields of the received packet. 0b - Compare with Destination Address 1b - Compare with Source Address
29-24 MBC	Mask Byte Control These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows: - Bit 29: MAC_Address 1 High[15:8] - Bit 28: MAC_Address 1 High[7:0] - Bit 27: MAC_Address 1 Low[31:24] - .. - Bit 24: MAC_Address 1 Low[7:0] You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.
23-19 —	Reserved
18-16 DCS	DMA Channel Select If the PDC bit of MAC_Ext_Configuration register is not set: This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address(#i) content is routed. If the PDC bit of MAC_Ext_Configuration register is set: This field contains the one-hot representation of one or more DMA Channel numbers to which an Rx packet whose DA matches the MAC Address(#i) content is routed.

76.17.96 MMC Control (MMC_Control)

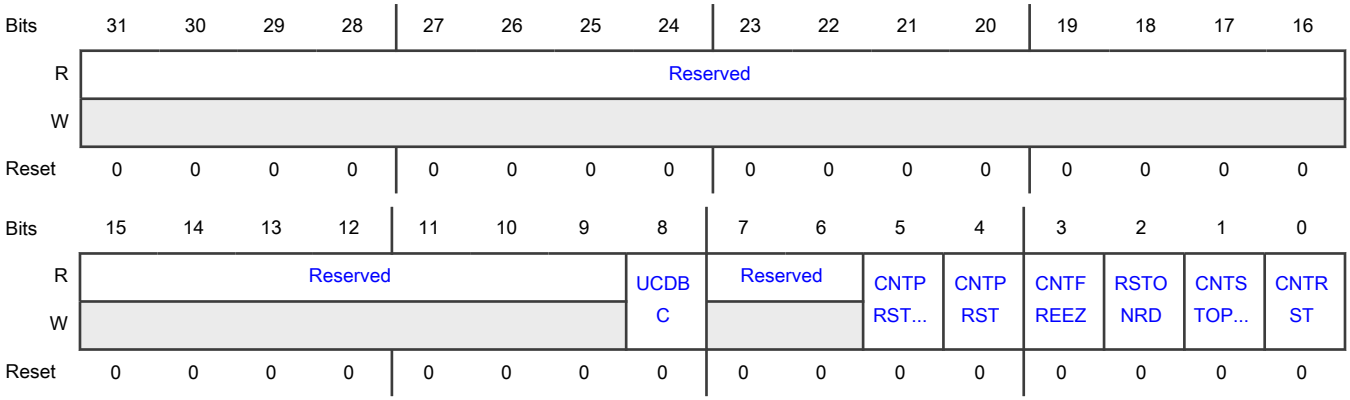
Offset

Register	Offset
MMC_Control	700h

Function

This register establishes the operating mode of MMC.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 UCDBC	Update MMC Counters for Dropped Broadcast Packets Note: The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set. When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of MAC_Packet_Filter register. When reset, the MMC Counters are not updated for dropped Broadcast packets. 0b - Update MMC Counters for Dropped Broadcast Packets is disabled 1b - Update MMC Counters for Dropped Broadcast Packets is enabled
7-6 —	Reserved
5 CNTPRSTLVL	Full-Half Preset When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF_F800 (Half 2KBytes) and all packet-counters gets preset to 0x7FFF_FFF0 (Half 16). When this bit is high and the CNTPRST bit is set, all MMC counters get preset

Table continues on the next page...

Table continued from the previous page...

Field	Function
	to almost-full value. All octet counters get preset to 0xFFFF_F800 (Full 2KBytes) and all packet-counters gets preset to 0xFFFF_FFF0 (Full 16). For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0. 0b - Full-Half Preset is disabled 1b - Full-Half Preset is enabled
4 CNTPRST	Counters Preset When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle. This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0b - Counters Preset is disabled 1b - Counters Preset is enabled
3 CNTFREEZ	MMC Counter Freeze When this bit is set, it freezes all MMC counters to their current value. Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode. 0b - MMC Counter Freeze is disabled 1b - MMC Counter Freeze is enabled
2 RSTONRD	Reset on Read When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read. 0b - Reset on Read is disabled 1b - Reset on Read is enabled
1 CNTSTOPRO	Counter Stop Rollover When this bit is set, the counter does not roll over to zero after reaching the maximum value. 0b - Counter Stop Rollover is disabled 1b - Counter Stop Rollover is enabled
0 CNTRST	Counters Reset When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0b - Counters are not reset 1b - All counters are reset

76.17.97 MMC Receive Interrupt (MMC_Rx_Interrupt)

Offset

Register	Offset
MMC_Rx_Interrupt	704h

Function

This register maintains the interrupts generated from all Receive statistics counters. The MMC Receive Interrupt register maintains the interrupts that are generated when the following occur: - Receive statistic counters reach half of their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter). - Receive statistic counters cross their maximum values (0xFFFF_FFFF for 32 bit counter and 0xFFFF for 16 bit counter). When the Counter Stop Rollover is set, interrupts are set but the counter remains at all-ones. The MMC Receive Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit. Note: R_SS_RC means that this register bit is set internally, and it is cleared when the Counter register is read.

76.17.98 MMC Transmit Interrupt (MMC_Tx_Interrupt)

Offset

Register	Offset
MMC_Tx_Interrupt	708h

Function

This register maintains the interrupts generated from all Transmit statistics counters. The MMC Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

76.17.99 MMC Receive Interrupt Mask (MMC_Rx_Interrupt_Mask)

Offset

Register	Offset
MMC_Rx_Interrupt_Mask	70Ch

Function

This register maintains the masks for interrupts generated from all Receive statistics counters. The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

Diagram

0 RXGBPKTIM	MMC Receive Good Bad Packet Counter Interrupt Mask Setting this bit masks the interrupt when the rxpacketcount_gb counter reaches half of the maximum value or the maximum value. 0b - MMC Receive Good Bad Packet Counter Interrupt Mask is disabled 1b - MMC Receive Good Bad Packet Counter Interrupt Mask is enabled

76.17.100 MMC Transmit Interrupt Mask (MMC_Tx_Interrupt_Mask)

Offset

Register	Offset
MMC_Tx_Interrupt_Mask	710h

Function

This register maintains the masks for interrupts generated from all Transmit statistics counters. The MMC Transmit Interrupt Mask register maintains the masks for the interrupts generated when the transmit statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

76.17.118 Transmit Late Collision Packets (Tx_Late_Collision_Packets)

Offset

Register	Offset
Tx_Late_Collision_Packets	758h

Function
This register provides the number of packets aborted by DWC_ether_qos because of late collision error.

Diagram

Fields

Field	Function
31-0 TXVLANG	Tx VLAN Packets Good This field provides the number of good VLAN packets transmitted.

76.17.126 Transmit O Size Packets Good (Tx_OSize_Packets_Good)

Offset

Register	Offset
Tx_OSize_Packets_Good	778h

Function

This register provides the number of packets transmitted by DWC_ether_qos without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the MAC_Configuration register).

Diagram

76.17.135 Receive Jabber Error Packets (Rx_Jabber_Error_Packets)

Offset

Register	Offset
Rx_Jabber_Error_Packets	7A0h

Function

This register provides the number of giant packets received by DWC_ether_qos with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

Fields

Field	Function
31-0 RXUCASTG	Rx Unicast Packets Good This field indicates the number of good unicast packets received.

76.17.145 Receive Length Error Packets (Rx_Length_Error_Packets)

Offset

Register	Offset
Rx_Length_Error_Packets	7C8h

Function

This register provides the number of packets received by DWC_ether_qos with length error (Length Type field not equal to packet size), for all packets with valid length field.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-0 RXLENERR	Rx Length Error Packets This field indicates the number of packets received with length error (Length Type field not equal to packet size), for all packets with valid length field.

76.17.146 Receive Out of Range Type Packet (Rx_Out_Of_Range_Type_Packets)

Offset

Register	Offset
Rx_Out_Of_Range_Type_Packets	7CCh

Function
This register provides the number of packets received by DWC_ether_qos with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

Diagram

Fields

Field	Function
31-0 RXOUTOFRNG	Rx Out of Range Type Packet This field indicates the number of packets received with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

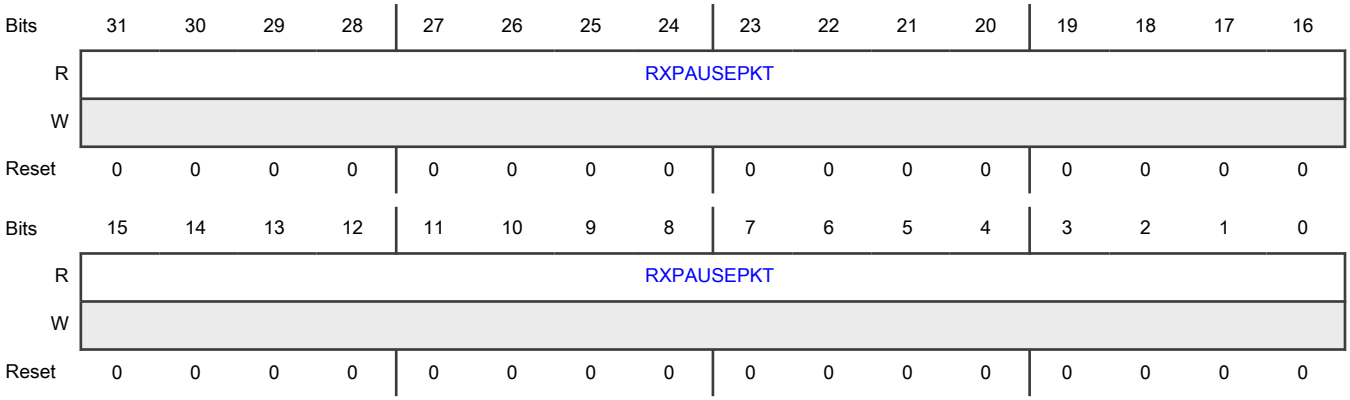
76.17.147 Receive Pause Packets (Rx_Pause_Packets)

Offset

Register	Offset
Rx_Pause_Packets	7D0h

Function
This register provides the number of good and valid Pause packets received by DWC_ether_qos.

Diagram



Fields

Field	Function
31-0 RXPAUSEPKT	Rx Pause Packets This field indicates the number of good and valid Pause packets received.

76.17.148 Receive FIFO Overflow Packets (Rx_FIFO_Overflow_Packets)

Offset

Register	Offset
Rx_FIFO_Overflow_Packets	7D4h

Function
This register provides the number of missed received packets because of FIFO overflow in DWC_ether_qos.

Diagram

76.17.150 Receive Watchdog Error Packets (Rx_Watchdog_Error_Packets)

Offset

Register	Offset
Rx_Watchdog_Error_Packets	7DCh

Function
This register provides the number of packets received by DWC_ether_qos with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in MAC_Configuration register), 10,240 bytes (when JE bit is set and WD bit is reset in MAC_Configuration register), 16,384 bytes (when WD bit is set in MAC_Configuration register) or the value programmed in the MAC_Watchdog_Timeout register).

Fields

Field	Function
31-0 RXWDGERR	Rx Watchdog Error Packets This field indicates the number of packets received with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in MAC_Configuration register), 10,240 bytes (when JE bit is set and WD bit is reset in MAC_Configuration register), 16,384 bytes (when WD bit is set in MAC_Configuration register) or the value programmed in the MAC_Watchdog_Timeout register).

76.17.151 Receive Error Packets (Rx_Receive_Error_Packets)

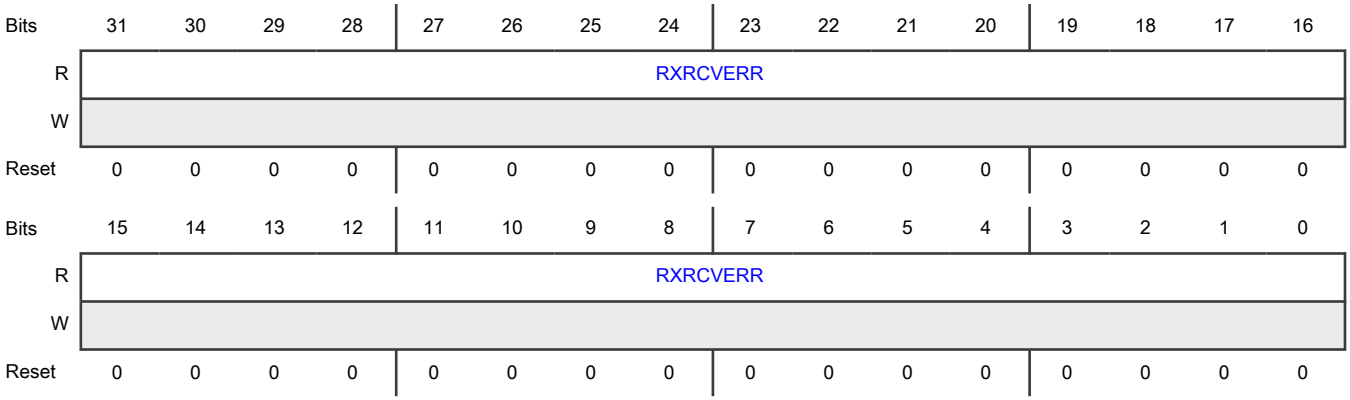
Offset

Register	Offset
Rx_Receive_Error_Packets	7E0h

Function

This register provides the number of packets received by DWC_ether_qos with Receive error or Packet Extension error on the GMII or MII interface.

Diagram



Fields

Field	Function
31-0 RXRCVERR	Rx Receive Error Packets This field indicates the number of packets received with Receive error or Packet Extension error on the GMII or MII interface.

76.17.152 Receive Control Packets Good (Rx_Control_Packets_Good)

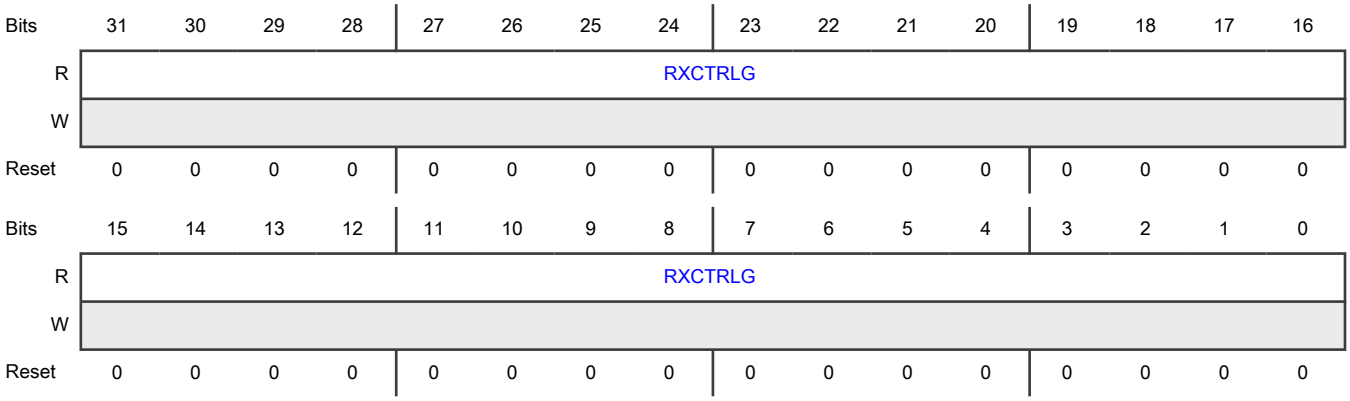
Offset

Register	Offset
Rx_Control_Packets_Good	7E4h

Function

This register provides the number of good control packets received by DWC_ether_qos.

Diagram



Fields

Field	Function
31-0 RXCTRLG	Rx Control Packets Good This field indicates the number of good control packets received.

76.17.153 MMC Transmit FPE Fragment Counter Interrupt Status (MMC_FPE_Tx_Interrupt)

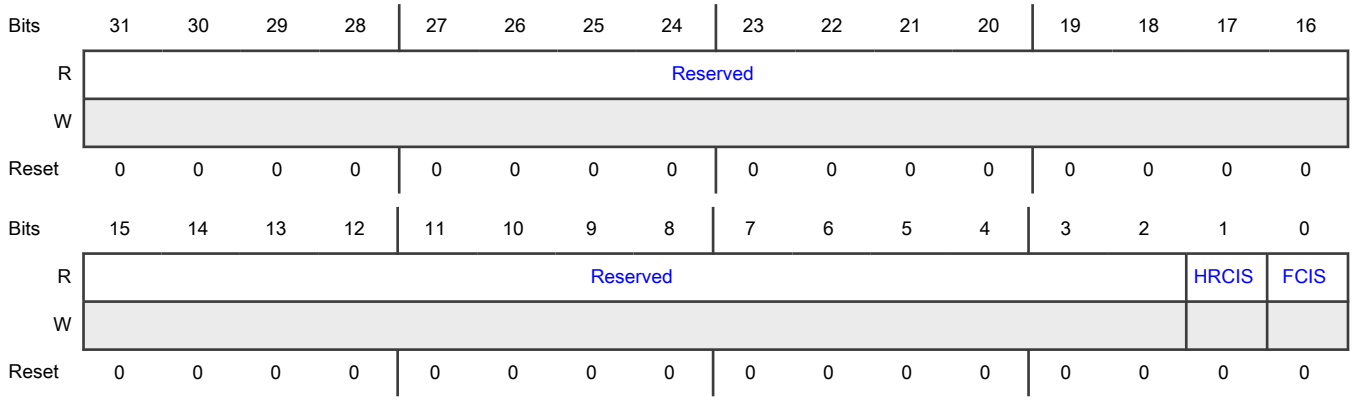
Offset

Register	Offset
MMC_FPE_Tx_Interrupt	8A0h

Function

This register maintains the interrupts generated from all FPE related Transmit statistics counters. The MMC FPE Transmit Interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000_0000 for 32 bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF_FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When Counter Stop Rollover is set, the interrupts are set but the counter remains at all-ones. The MMC FPE Transmit Interrupt register is a 32 bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Diagram



Fields

Field	Function
31-2 —	Reserved
1 HRCIS	MMC Tx Hold Request Counter Interrupt Status This bit is set when the Tx_Hold_Req_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration. 0b - MMC Tx Hold Request Counter Interrupt Status not detected 1b - MMC Tx Hold Request Counter Interrupt Status detected
0 FCIS	MMC Tx FPE Fragment Counter Interrupt status This bit is set when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Access restriction applies. Clears on read. Self-set to 1 on internal event. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration. 0b - MMC Tx FPE Fragment Counter Interrupt status not detected 1b - MMC Tx FPE Fragment Counter Interrupt status detected

76.17.154 MMC FPE Transmit Interrupt Mask (MMC_FPE_Tx_Interrupt_Mask)

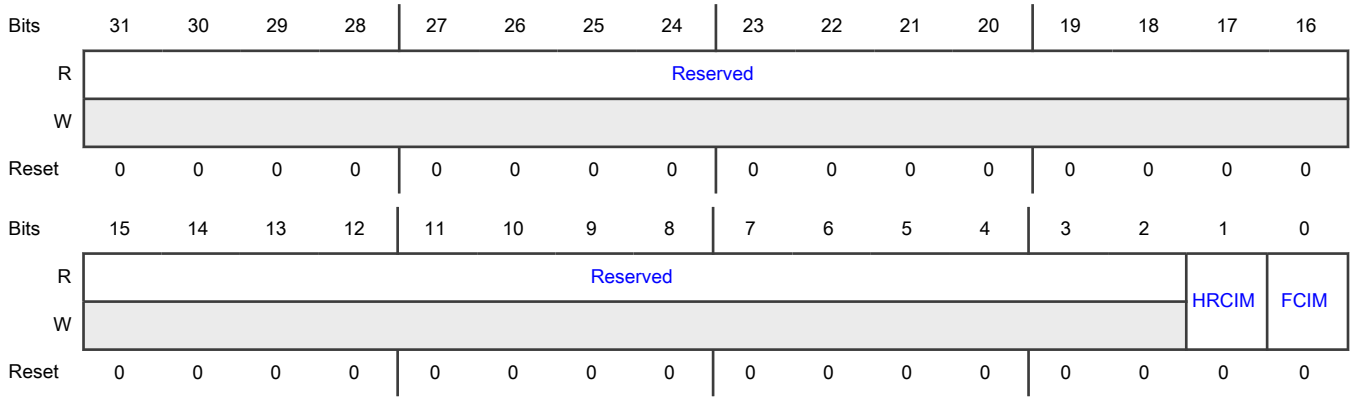
Offset

Register	Offset
MMC_FPE_Tx_Interrupt_Mask	8A4h

Function

This register maintains the masks for interrupts generated from all FPE related Transmit statistics counters. The MMC Receive Interrupt Mask register maintains the masks for the interrupts generated when FPE related receive statistic counters reach half of their maximum value or the maximum values. This register is 32 bit wide.

Diagram



Fields

Field	Function
31-2 —	Reserved
1 HRCIM	MMC Transmit Hold Request Counter Interrupt Mask Setting this bit masks the interrupt when the Tx_Hold_Req_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE with AV_EST Enabled configuration. 0b - MMC Transmit Hold Request Counter Interrupt Mask is disabled 1b - MMC Transmit Hold Request Counter Interrupt Mask is enabled
0 FCIM	MMC Transmit Fragment Counter Interrupt Mask Setting this bit masks the interrupt when the Tx_FPE_Fragment_Cntr counter reaches half of the maximum value or the maximum value. Exists when any one of the RX/TX MMC counters are enabled during FPE Enabled configuration. 0b - MMC Transmit Fragment Counter Interrupt Mask is disabled 1b - MMC Transmit Fragment Counter Interrupt Mask is enabled

76.17.155 Transmit FPE Fragment Counter (MMC_Tx_FPE_Fragment_Cntr)

Offset

Register	Offset
MMC_Tx_FPE_Fragment_Cntr	8A8h

Function

This register provides the number of additional mPackets transmitted due to preemption.

Diagram

Fields

Field	Function
31-29 —	Reserved
28 DMCHEN0	DMA Channel Select Enable When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter. 0b - DMA Channel Select is disabled 1b - DMA Channel Select is enabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
27-26 —	Reserved
25-24 DMCHN0	DMA Channel Number When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.
23-22 —	Reserved
21 L4DPIM0	Layer 4 Destination Port Inverse Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4DPM0 bit is set high. 0b - Layer 4 Destination Port Inverse Match is disabled 1b - Layer 4 Destination Port Inverse Match is enabled
20 L4DPM0	Layer 4 Destination Port Match Enable When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching. 0b - Layer 4 Destination Port Match is disabled 1b - Layer 4 Destination Port Match is enabled
19 L4SPIM0	Layer 4 Source Port Inverse Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching. This bit is valid and applicable only when the L4SPM0 bit is set high. 0b - Layer 4 Source Port Inverse Match is disabled 1b - Layer 4 Source Port Inverse Match is enabled
18 L4SPM0	Layer 4 Source Port Match Enable When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching. 0b - Layer 4 Source Port Match is disabled 1b - Layer 4 Source Port Match is enabled
17 —	Reserved
16	Layer 4 Protocol Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
L4PEN0	When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching. The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set. 0b - Layer 4 Protocol is disabled 1b - Layer 4 Protocol is enabled
15-11 L3HDBM0	Layer 3 IP DA Higher Bits Match IPv4 Packets: This field contains the number of higher bits of IP Destination Address that are matched in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits: - 0: No bits are masked. - 1: LSb[0] is masked. - 2: Two LSbs [1:0] are masked - .. - 127: All bits except MSb are masked. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.
10-6 L3HSBM0	Layer 3 IP SA Higher Bits Match IPv4 Packets: This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field: - 0: No bits are masked. - 1: LSb[0] is masked - 2: Two LSbs [1:0] are masked - .. - 31: All bits except MSb are masked. IPv6 Packets: This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.
5 L3DAIM0	Layer 3 IP DA Inverse Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching. This bit is valid and applicable only when the L3DAM0 bit is set high. 0b - Layer 3 IP DA Inverse Match is disabled 1b - Layer 3 IP DA Inverse Match is enabled
4 L3DAM0	Layer 3 IP DA Match Enable When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching. Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering. 0b - Layer 3 IP DA Match is disabled 1b - Layer 3 IP DA Match is enabled
3 L3SAIM0	Layer 3 IP SA Inverse Match Enable When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching. This bit is valid and applicable only when the L3SAM0 bit is set.

31-0 L3A17	Layer 3 Address 1 Field When the L3PEN0 and L3SAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets. When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset and the L3SAM0 bit is set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

76.17.209 MAC Layer 3 Address 2 Reg 7 (MAC_Layer3_Addr2_Reg7)

Offset

Register	Offset
MAC_Layer3_Addr2_Reg7	A68h

Function

The Layer 3 Address 2 Register 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

When the L3PEN0 and L3DAM0 bits are set in the MAC_L3_L4_Control0 register, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets. When the L3PEN0 bit is reset in the MAC_L3_L4_Control0 register, this field is not used.

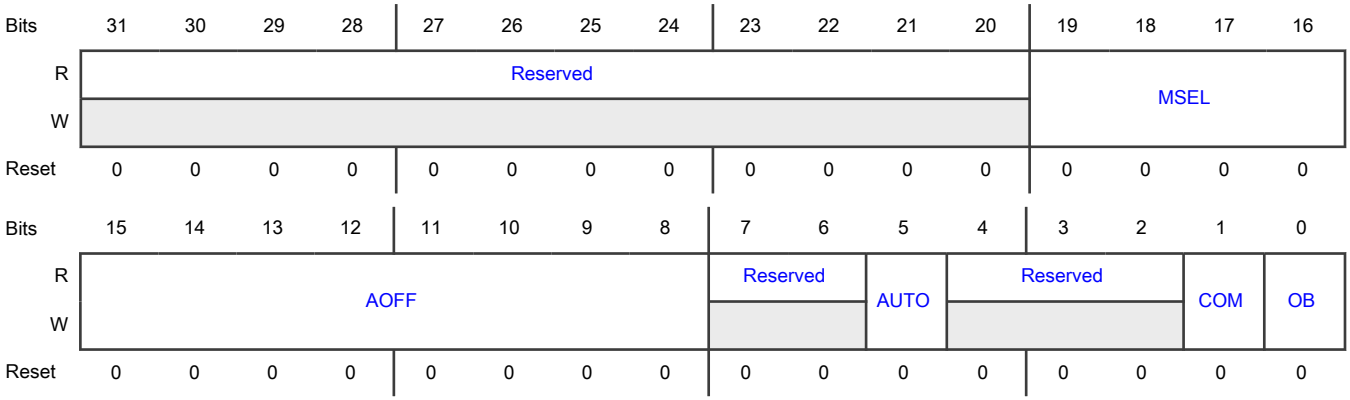
76.17.211 MAC Indirect Access Control (MAC_Indir_Access_Ctrl)

Offset

Register	Offset
MAC_Indir_Access_Ctrl	A70h

Function
This register provides the Indirect Access control and status for MAC_<MSEl>_<AOFF> registers.

Diagram



Fields

Field	Function
31-20 —	Reserved
19-16 MSEL	Mode Select This field is used in indirect access of MAC_<MSEL>_<AOFF>. This field must be set along with initiation of read/write to MAC_<MSEL>_<AOFF> and should not be changed until the OB is reset. Values: - 0000:Typ_RXQ_ (Type based RXQ mappping) - 0001-1111: Reserved for future use.

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-8 AOFF	Address Offset This field is used in indirect access of MAC_<MSEL>_<AOFF>. This field must be set along with initiation of read/write to MAC_<MSEL>_<AOFF> and should not be changed until the OB is reset. Values: - 00000000: IndReg0(Indirect register 0) - 00000001: IndReg1(Indirect register 1) - ... - 00000111: IndReg7(Indirect register 7) - 00001000-11111111: Reserved for future use.
7-6 —	Reserved
5 AUTO	Auto increment - 1: AOFF is incremented by 1. Software should ensure not to cause a wrap condition. Byte wise read/write is not supported when auto increment is enabled. - 0: AOFF is not incremented automatically. Software should program the correct Address Offset for each access.
4-2 —	Reserved
1 COM	Command type This bit indicates the register access type. - 1: Indicates a read operation. - 0: Indicates a write operation. 0b - Write operation 1b - Read operation
0 OB	Operation Busy. This bit is set along with a read or write command for initiating the indirect access to MAC_<MSEL>_<AOFF> register. This bit is reset when the read or write command to MAC_<MSEL>_<AOFF> register is complete. The next indirect register access can be initiated only after this bit is reset. During a write operation, the bit is reset only after the data has been written into MAC_<MSEL>_<AOFF> register. During a read operation, the data should be read from MAC_Indir_Access_Data register only after this bit is reset.

76.17.212 MAC Indirect Access Data (MAC_Indir_Access_Data)

Offset

Register	Offset
MAC_Indir_Access_Data	A74h

Function
This register holds the read/write data for Indirect Access of MAC_<MSEL_<AOFF> registers.

Diagram

Reset	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-29 —	Reserved
28 AV8021ASMEN	AV 802.1AS Mode Enable When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS mode of operation. When PTP offload feature is enabled, for the purpose of PTP offload, the transport specific field in the PTP header is generated and checked based on the value of this bit. 0b - AV 802.1AS Mode is disabled 1b - AV 802.1AS Mode is enabled
27-25 —	Reserved
24 TXTSSTSM	Transmit Timestamp Status Mode When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the MAC_Tx_Timestamp_Status_Nanoseconds register. 0b - Transmit Timestamp Status Mode is disabled 1b - Transmit Timestamp Status Mode is enabled
23-21 —	Reserved
20 ESTI	External System Time Input When this bit is set, the MAC uses the external 64-bit reference System Time input for the following: - To take the timestamp provided as status - To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled. When this bit is reset, the MAC uses the internal reference System Time. 0b - External System Time Input is disabled 1b - External System Time Input is enabled
19 —	Reserved
18 TSENMACADDR	Enable MAC Address for PTP Packet Filtering When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet. When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated, when PTP is directly sent over Ethernet. For normal

Table continues on the next page...

Table continued from the previous page...

Field	Function
	time stamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching. For PTP offload, only MAC address register 0 is considered for unicast destination address matching. 0b - MAC Address for PTP Packet Filtering is disabled 1b - MAC Address for PTP Packet Filtering is enabled
17-16 SNAPTYPSEL	Select PTP packets for Taking Snapshots These bits, along with Bits 15 and 14, decide the set of PTP packet types for which snapshot needs to be taken. The encoding is given in Timestamp Snapshot Dependency on Register Bits Table.
15 TSMSTRENA	Enable Snapshot for Messages Relevant to Master When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node. 0b - Snapshot for Messages Relevant to Master is disabled 1b - Snapshot for Messages Relevant to Master is enabled
14 TSEVNTENA	Enable Timestamp Snapshot for Event Messages When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see Timestamp Snapshot Dependency on Register Bits Table. 0b - Timestamp Snapshot for Event Messages is disabled 1b - Timestamp Snapshot for Event Messages is enabled
13 TSIPV4ENA	Enable Processing of PTP Packets Sent over IPv4-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default. 0b - Processing of PTP Packets Sent over IPv4-UDP is disabled 1b - Processing of PTP Packets Sent over IPv4-UDP is enabled
12 TSIPV6ENA	Enable Processing of PTP Packets Sent over IPv6-UDP When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets. 0b - Processing of PTP Packets Sent over IPv6-UDP is disabled 1b - Processing of PTP Packets Sent over IPv6-UDP is enabled
11 TSIPENA	Enable Processing of PTP over Ethernet Packets When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets. 0b - Processing of PTP over Ethernet Packets is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Processing of PTP over Ethernet Packets is enabled
10 TSVER2ENA	Enable PTP Packet Processing for Version 2 Format When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'. 0b - PTP Packet Processing for Version 2 Format is disabled 1b - PTP Packet Processing for Version 2 Format is enabled
9 TSCTRLSSR	Timestamp Digital or Binary Rollover Control When this bit is set, the Timestamp Low register rolls over after 0x3B9A_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of sub-second register is 0x7FFF_FFFF. The sub-second increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit. 0b - Timestamp Digital or Binary Rollover Control is disabled 1b - Timestamp Digital or Binary Rollover Control is enabled
8 TSENALL	Enable Timestamp for All Packets When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC. 0b - Timestamp for All Packets disabled 1b - Timestamp for All Packets enabled
7 —	Reserved
6 PTGE	Presentation Time Generation Enable When this bit is set the Presentation Time generation is enabled. 0b - Presentation Time Generation is disabled 1b - Presentation Time Generation is enabled
5 TSADDREG	Update Addend Register When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Addend Register is not updated 1b - Addend Register is updated
4 —	Reserved
3	Update Timestamp

Table continues on the next page...

Table continued from the previous page...

Field	Function
TSUPDT	When this bit is set, the system time is updated (added or subtracted) with the value specified in MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before updating it. This bit is reset when the update is complete in hardware. The Timestamp Higher Word register (if enabled while configuring the IP) is not updated. When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Timestamp is not updated 1b - Timestamp is updated
2 TSINIT	Initialize Timestamp When this bit is set, the system time is initialized (overwritten) with the value specified in the MAC_System_Time_Seconds_Update and MAC_System_Time_Nanoseconds_Update registers. This bit should be zero before it is updated. This bit is reset when the initialization is complete. The Timestamp Higher Word register (if enabled while configuration the IP) can only be initialized. When Media Clock Generation and Recovery is configured (DWC_EQOS_FLEXI_PPS_OUT_EN) and enabled MAC_Presn_Time_Updt should also be updated before setting this field. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Timestamp is not initialized 1b - Timestamp is initialized
1 TSCFUPDT	Fine or Coarse Timestamp Update When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp. 0b - Coarse method is used to update system timestamp 1b - Fine method is used to update system timestamp
0 TSENA	Enable Timestamp When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode. On the Receive side, the MAC processes the 1588 packets only if this bit is set. 0b - Timestamp is disabled 1b - Timestamp is enabled

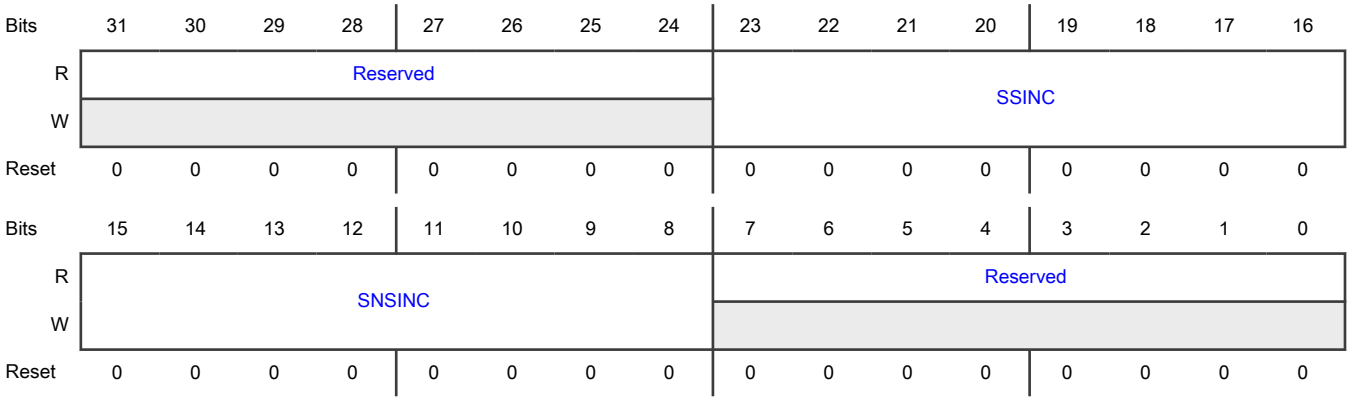
76.17.222 MAC Sub Second Increment (MAC_Sub_Second_Increment)

Offset

Register	Offset
MAC_Sub_Second_Increment	B04h

Function
This register specifies the value to be added to the internal system time register every cycle of CLK_PTP_REF_I clock.

Diagram



Fields

Field	Function
31-24 —	Reserved
23-16 SSINC	Sub-second Increment Value The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the sub-second register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [Bit 9 (TSCTRLSSR) is set in MAC_Timestamp_Control]. When TSCTRLSSR is clear, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.
15-8 SNSINC	Sub-nanosecond Increment Value This field contains the sub-nanosecond increment value, represented in nanoseconds multiplied by 2^8. This value is accumulated with the sub-nanoseconds field of the subsecond register. For example, when TSCTRLSSR field in the MAC_Timestamp_Control register is set. and if the required increment is 5.3ns, then SSINC should be 0x05 and SNSINC should be 0x4C.
7-0 —	Reserved

76.17.223 MAC System Time In Seconds (MAC_System_Time_Seconds)

Offset

Register	Offset
MAC_System_Time_Seconds	B08h

Function

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from CLK_PTP_REF_I to CSR clock).

Diagram

Fields

Field	Function
31-0 TSS	Timestamp Second The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

76.17.224 MAC System Time In Nanoseconds (MAC_System_Time_Nanoseconds)

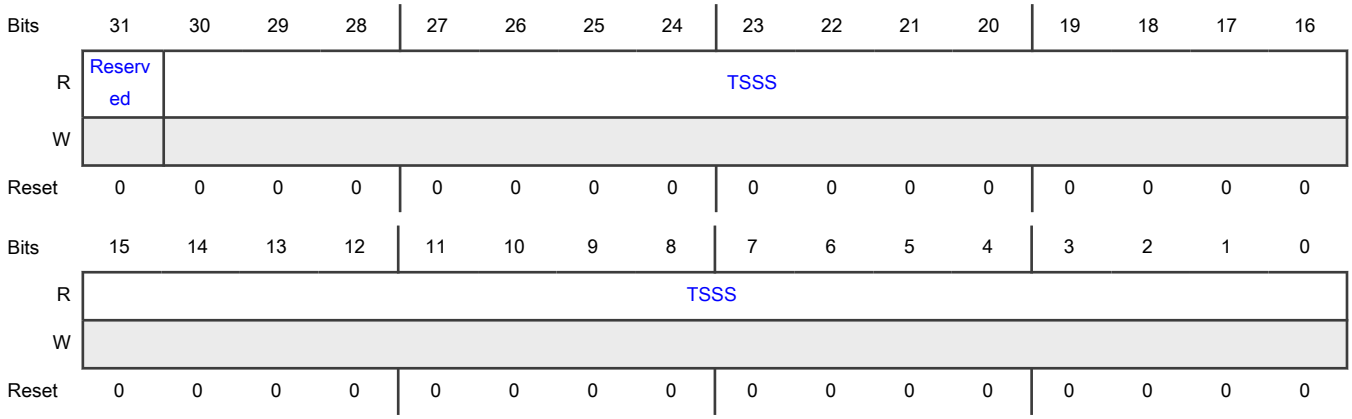
Offset

Register	Offset
MAC_System_Time_Nanoseconds	B0Ch

Function

The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC.

Diagram



Fields

Field	Function
31 —	Reserved
30-0 TSSS	Timestamp Sub Seconds The value in this field has the sub-second representation of time, with an accuracy of 0.46 ns. When Bit 9 is set in MAC_Timestamp_Control, each bit represents 1 ns. The maximum value is 0x3B9A_C9FF after which it rolls-over to zero.

76.17.225 MAC System Time Seconds Update (MAC_System_Time_Seconds_Update)

Offset

Register	Offset
MAC_System_Time_Seconds_Update	B10h

Function

The System Time Seconds Update register, along with the System Time Nanoseconds Update register, initializes or updates the system time maintained by the MAC. You must write both registers before setting the TSINIT or TSUPDT bits in DWC_eqos_top_map/EQOS_MAC/MAC_Timestamp_Control.

Diagram

R W	ADDSUB	TSSS														
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	TSSS															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31 ADDSUB	Add or Subtract Time When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register. 0b - Add time 1b - Subtract time
30-0 TSSS	Timestamp Sub Seconds The value in this field is the sub-seconds part of the update. - ADDSUB is 1: This field must be programmed with the complement of the sub-seconds part of the update value as described. - ADDSUB is 0: This field must be programmed with the sub-seconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the MAC_Timestamp_Control register. - TSCTRLSSR field in the MAC_Timestamp_Control register is 1: -- The programmed value must be 10^9 - <sub-second value>. -- Each bit represents 1 ns and the programmed value should not exceed 0x3B9A_C9FF. - TSCTRLSSR field in the MAC_Timestamp_Control register is 0: -- The programmed value must be 2^31 - <sub-second_value>. -- Each bit represents an accuracy of 0.46 ns. For example, to subtract 2.000000001 seconds from the system time, then the TSSS field in the MAC_Timestamp_Nanoseconds_Update register must be 0x7FFF_FFFF (that is, 2^31 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is reset and 0x3B9A_C9FF (that is, 10^9 - 1), when TSCTRLSSR bit in MAC_Timestamp_Control is set.

76.17.227 MAC Timestamp Addend (MAC_Timestamp_Addend)

Offset

Register	Offset
MAC_Timestamp_Addend	B18h

Function

This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the MAC_Timestamp_Control register). The content of this register is added to a 32-bit accumulator in every clock cycle (of CLK_PTP_REF_I) and the system time is updated when the accumulator overflows.

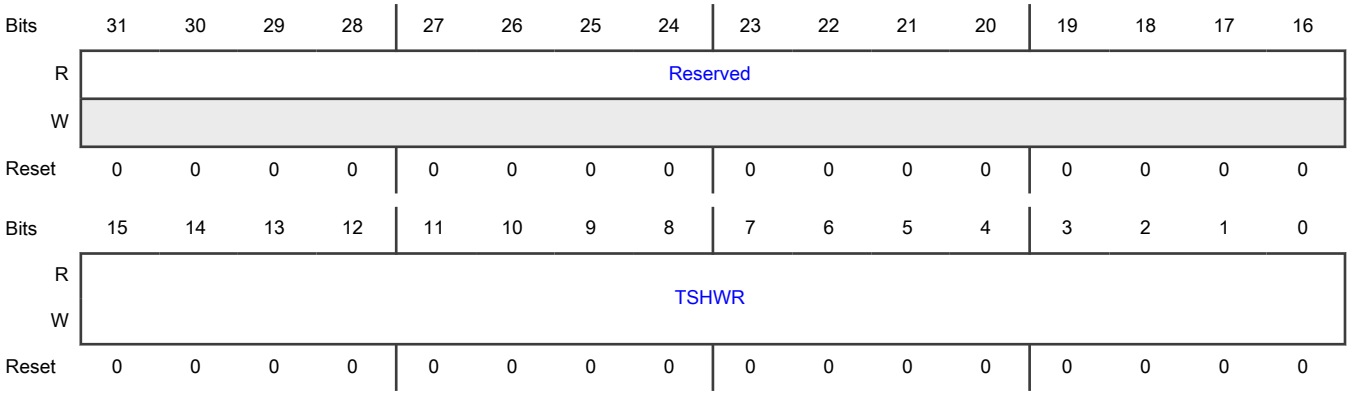
76.17.228 MAC System Time Higher Word In Seconds (MAC_System_Time_Higher_Word_Seconds)

Offset

Register	Offset
MAC_System_Time_Higher_Word_Seconds	B1Ch

Function
System Time - Higher Word Seconds register.

Diagram



Fields

Field	Function
31-16 —	Reserved
15-0 TSHWR	Timestamp Higher Word Register This field contains the most-significant 16-bits of timestamp seconds value. This register is optional. You can add this register by selecting the Add IEEE 1588 Higher Word Register option. This register is directly written to initialize the value and it is incremented when there is an overflow from 32-bits of the System Time Seconds register. Access restriction applies. Updated based on the event. Setting 1 sets. Setting 0 clears.

76.17.229 MAC Timestamp Status (MAC_Timestamp_Status)

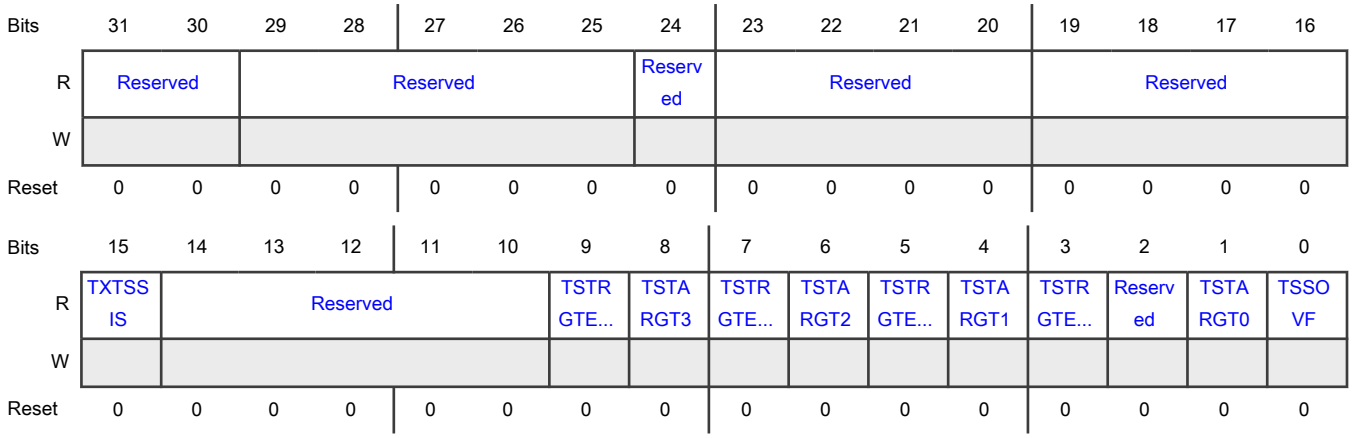
Offset

Register	Offset
MAC_Timestamp_Status	B20h

Function

Timestamp Status register. All bits except Bits[27:25] gets cleared when the application reads this register.

Diagram



Fields

Field	Function

	applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Timestamp Target Time Reached for Target Time PPS2 status not detected 1b - Timestamp Target Time Reached for Target Time PPS2 status detected
5 TSTRGTERR1	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Timestamp Target Time Error status not detected 1b - Timestamp Target Time Error status detected
4 TSTARGT1	Timestamp Target Time Reached for Target Time PPS1 When this bit is set and MCGREN1 of MAC_PPS_Control register is reset, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS1_Target_Time_Seconds and MAC_PPS1_Target_Time_Nanoseconds registers. When this bit is set and MCGREN1 of MAC_PPS_Control register is set, it indicates that mcgr_dma_req_o[1] is asserted. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Timestamp Target Time Reached for Target Time PPS1 status not detected 1b - Timestamp Target Time Reached for Target Time PPS1 status detected
3 TSTRGTERR0	Timestamp Target Time Error This bit is set when the latest target time programmed in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers elapses. This bit is cleared when the application reads this bit. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Timestamp Target Time Error status not detected 1b - Timestamp Target Time Error status detected
2 —	Reserved
1 TSTARGT0	Timestamp Target Time Reached When this bit is set and MCGREN0 of MAC_PPS_Control register is reset, it indicates that the value of system time is greater than or equal to the value specified in the MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds registers. When this bit is set and MCGREN0 of MAC_PPS_Control register is set, it indicates that mcgr_dma_req_o[0] is asserted. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Timestamp Target Time Reached status not detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Timestamp Target Time Reached status detected
0 TSSOVF	Timestamp Seconds Overflow When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 32'hFFFF_FFFF. Access restriction applies. Clears on read (or this bit is written to 1 when RCWE bit in MAC_CSR_SW_Ctrl register is set). Self-set to 1 on internal event. 0b - Timestamp Seconds Overflow status not detected 1b - Timestamp Seconds Overflow status detected

76.17.230 MAC Transmit Timestamp Status In Nanoseconds (MAC_Tx_Timestamp_Status_Nanoseconds)

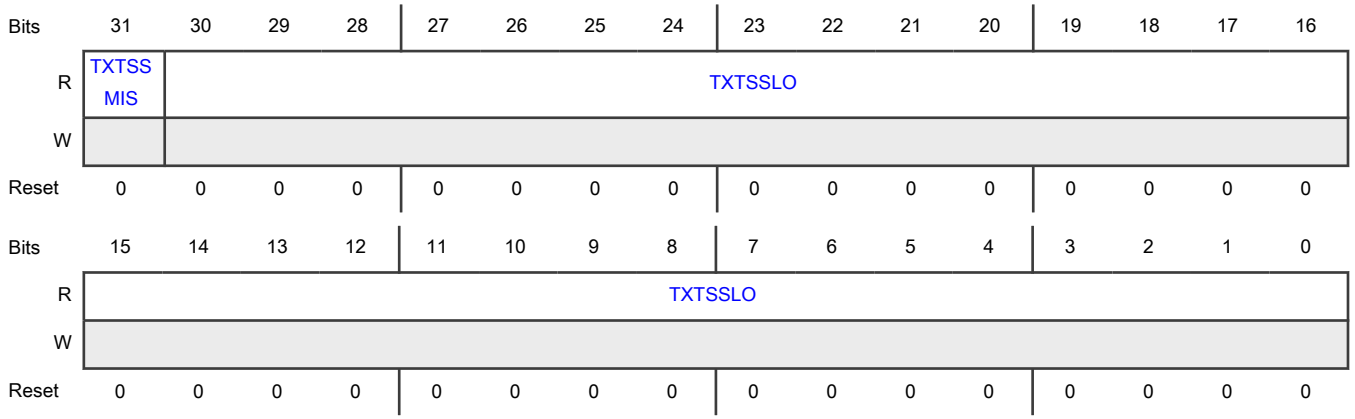
Offset

Register	Offset
MAC_Tx_Timestamp_Status_Nanoseconds	B30h

Function

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled. The MAC_Tx_Timestamp_Status_Nanoseconds register, along with MAC_Tx_Timestamp_Status_Seconds, gives the 64-bit timestamp captured for the PTP packet successfully transmitted by the MAC. This value is considered to be read by the application when the last byte of MAC_Tx_Timestamp_Status_Nanoseconds is read. In the little-endian mode, this means when bits[31:24] are read; in big-endian mode, bits[7:0] are read. If the application does not read these registers and timestamp of another packet is captured, then either the current timestamp is lost (overwritten) or the new timestamp is lost (dropped), depending on the setting of the TXTSSTSM bit of the MAC_Timestamp_Control register. The status bit TXTSSIS bit [15] in MAC_Timestamp_Status register is set when the MAC transmitter captures the timestamp.

Diagram



Fields

Field	Function
31 TXTSSMIS	Transmit Timestamp Status Missed When this bit is set, it indicates one of the following: - The timestamp of the current packet is ignored if TXTSSTSM bit of the MAC_Timestamp_Control register is reset - The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the MAC_Timestamp_Control register is set. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Transmit Timestamp Status Missed status not detected 1b - Transmit Timestamp Status Missed status detected
30-0 TXTSSLO	Transmit Timestamp Status Low This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

76.17.231 MAC Transmit Timestamp Status In Seconds (MAC_Tx_Timestamp_Status_Seconds)

Offset

Register	Offset
MAC_Tx_Timestamp_Status_Seconds	B34h

Function

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-0 TXTSSHI	Transmit Timestamp Status High This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

76.17.232 MAC Timestamp Ingress Asymmetry Correction (MAC_Timestamp_Ingress_Asym_Corr)

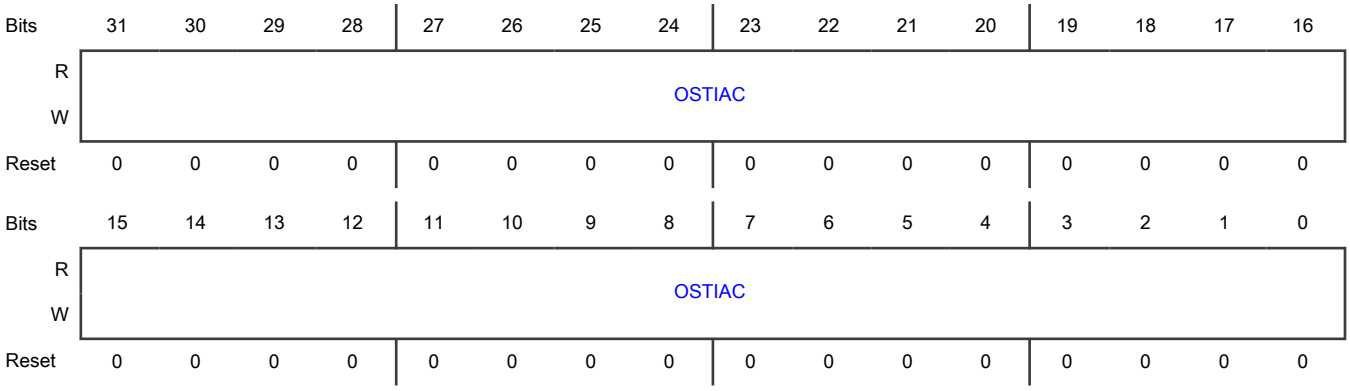
Offset

Register	Offset
MAC_Timestamp_Ingress_Asym_Corr	B50h

Function

The MAC Timestamp Ingress Asymmetry Correction register contains the Ingress Asymmetry Correction value to be used while updating correction field in PDelay_Resp PTP messages.

Diagram



Fields

Field	Function
31-0 OSTIAC	One-Step Timestamp Ingress Asymmetry Correction This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2^16. For example, 2.5 ns is represented as 0x00028000. The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

76.17.233 MAC Timestamp Egress Asymmetry Correction (MAC_Timestamp_Egress_Asym_Corr)

Offset

Register	Offset
MAC_Timestamp_Egress_Asym_Corr	B54h

Function

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

Diagram

R W	OSTEAC															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 OSTEAC	One-Step Timestamp Egress Asymmetry Correction This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2^16. For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFD_8000, which is the 2's complement of 0x0002_8000(2.5 * 216). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003_4CCC (3.3 * 216).

76.17.234 MAC Timestamp Ingress Correction In Nanoseconds (MAC_Timestamp_Ingress_Corr_Nanosecond)

Offset

Register	Offset
MAC_Timestamp_Ingress_Corr_Nanosecond	B58h

Function

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

Table continued from the previous page...

Field	Function
	01b - Enables MCGR Interrupt whose status bit is indicated by TSTARGT0 (MAC_Timestamp_Status[1]) 10b - Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS0 output signal generation 11b - Target Time registers are programmed only for starting or stopping the PPS0 output signal generation. No interrupt is asserted
4 PPSEN0	Flexible PPS Output Mode Enable When this bit is - 1: Bits[3:0] function as PPSCMD. - 0: Bits[3:0] function as PPSCTRL (Fixed PPS mode). 0b - Flexible PPS Output Mode is disabled 1b - Flexible PPS Output Mode is enabled
3-0 PPSCTRL_PPSCMD	PPS Output Frequency Control This field controls the frequency of the PPS0 output (ptp_pps_o[0]) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies: - 0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz. - 0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz. - 0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz. - 0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz. - .. - 1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz. Note: In the binary rollover mode, the PPS output (ptp_pps_o) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example: - When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms - When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of One clock of 50 percent duty cycle and 537 ms period Second clock of 463 ms period (268 ms low and 195 ms high) - When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of Three clocks of 50 percent duty cycle and 268 ms period Fourth clock of 195 ms period (134 ms low and 61 ms high) This behavior is because of the non-linear toggling of bits in the digital rollover mode in the MAC_System_Time_Nanoseconds register. or Flexible PPS Output (ptp_pps_o[0]) Control Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are 'all-zero'. The following list describes the values of PPSCMD0: - 0000: No Command - 0001: START Single Pulse This command generates single pulse rising at the start point defined in MAC_PPS0_Target_Time_Seconds and MAC_PPS0_Target_Time_Nanoseconds register and of a duration defined in the PPS0 Width Register. - 0010: START Pulse Train This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS0 Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands. - 0011: Cancel START This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time. - 0100: STOP Pulse train at time This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010) after the time programmed in the Target Time registers elapses. - 0101: STOP Pulse Train immediately This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD = 0010). - 110: Cancel STOP Pulse train This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The

Table continues on the next page...

Table continued from the previous page...

Field	Function
	PPS pulse train becomes free-running on the successful execution of this command. - 0111-1111: Reserved or Presentation Time Control When MCGREN0 is 1, these bits are treated as Presentation time control bits. The following list describes the values of PPSCMD0: - 0000: MCGR operation is not carried out. If set to this value in the mid of clock recovery or generation, all the processing inputs are flushed - 0001: Capture the Presentation time at the rising edge of MCG_PST_TRIG_I[0] into the MAC_PPS0_Target_Time_Seconds register - 0010: Capture the Presentation time at the falling edge of MCG_PST_TRIG_I[0] into the MAC_PPS0_Target_Time_Seconds register - 0011: Capture the Presentation time at both edges of MCG_PST_TRIG_I[0] into the MAC_PPS0_Target_Time_Seconds register - 0100-1000: Reserved - 1001: Toggle output on compare - 1010: Pulse output low on compare for one PTP-clock cycle - 1011: Pulse output high on compare for one PTP-clock cycle - 1100-1111: Reserved

76.17.241 MAC PPS0 Target Time In Seconds (MAC_PPS0_Target_Time_Seconds)

Offset

Register	Offset
MAC_PPS0_Target_Time_Seconds	B80h

Function

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC_Timestamp_Status] when the system time exceeds the value programmed in these registers.

Diagram

Fields

Field	Function
31-0 TSTRH0	PPS Target Time Seconds Register

Table continues on the next page...

Field	Function
	This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the MAC_PPS_Control register. If DWC_EQOS_FLEXI_PPS_OUT_EN is enabled in the configuration and PTGE field of MAC_Timestamp_Control Register is set with Presentation time control set in recovery mode, then these bits indicate the TPT being programmed by the application and in generation mode it indicates the CPT generated at the sampled trigger.

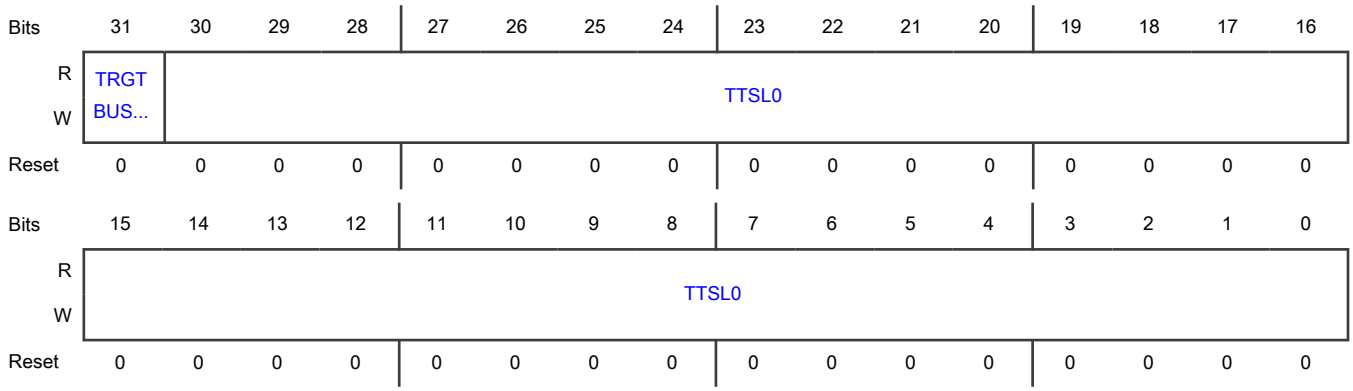
76.17.242 MAC PPS0 Target Time In Nanoseconds (MAC_PPS0_Target_Time_Nanoseconds)

Offset

Register	Offset
MAC_PPS0_Target_Time_Nanoseconds	B84h

Function
PPS0 Target Time Nanoseconds register.

Diagram



Fields

Field	Function
31 TRGTBUSY0	PPS Target Time Register Busy The MAC sets this bit when the PPSCMD0 field in the MAC_PPS_Control register is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers to the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted. 0b - PPS Target Time Register Busy status is not detected 1b - PPS Target Time Register Busy is detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
30-0 TTSL0	Target Time Low for PPS Register This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in MAC_PPS_Control. When the TSCTRLSSR bit is reset in the MAC_Timestamp_Control register, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. When the TSCTRLSSR bit is set in the MAC_Timestamp_Control register, this value should not exceed 0x3B9A_C9FF. The actual start or stop time of the PPS signal output might have an error margin up to one unit of sub-second increment value. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

76.17.243 MAC PPS0 Interval (MAC_PPS0_Interval)

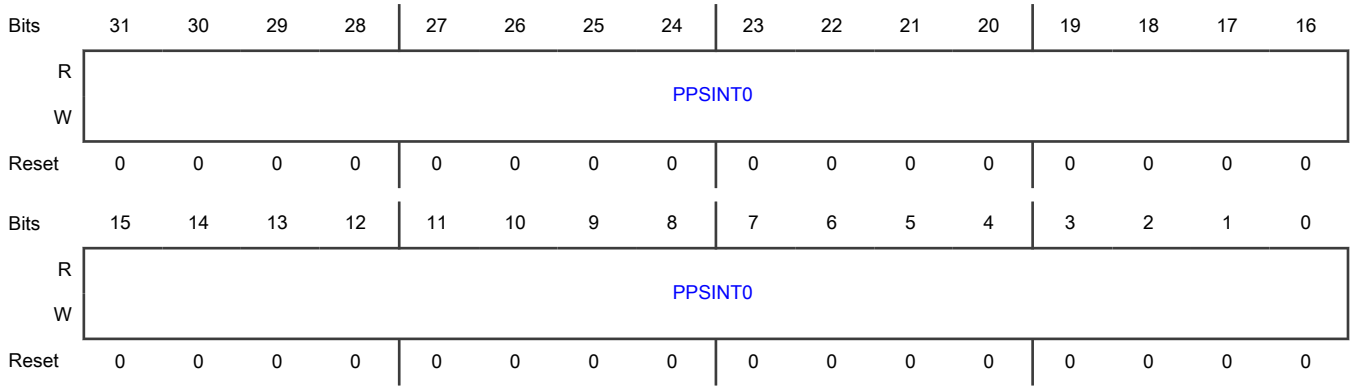
Offset

Register	Offset
MAC_PPS0_Interval	B88h

Function

The PPS0 Interval register contains the number of units of sub-second increment value between the rising edges of PPS0 signal output (PTP_PPS_O[0]).

Diagram



Fields

Field	Function
31-0 PPSINT0	PPS Output Signal Interval These bits store the interval between the rising edges of PPS0 signal output. The interval is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired

Table continues on the next page...

Field	Function
	interval between the rising edges of PPS0 signal output is 100 ns (that is, 5 units of sub-second increment value), you should program value 4 (5-1) in this register.

76.17.244 MAC PPS0 Width (MAC_PPS0_Width)

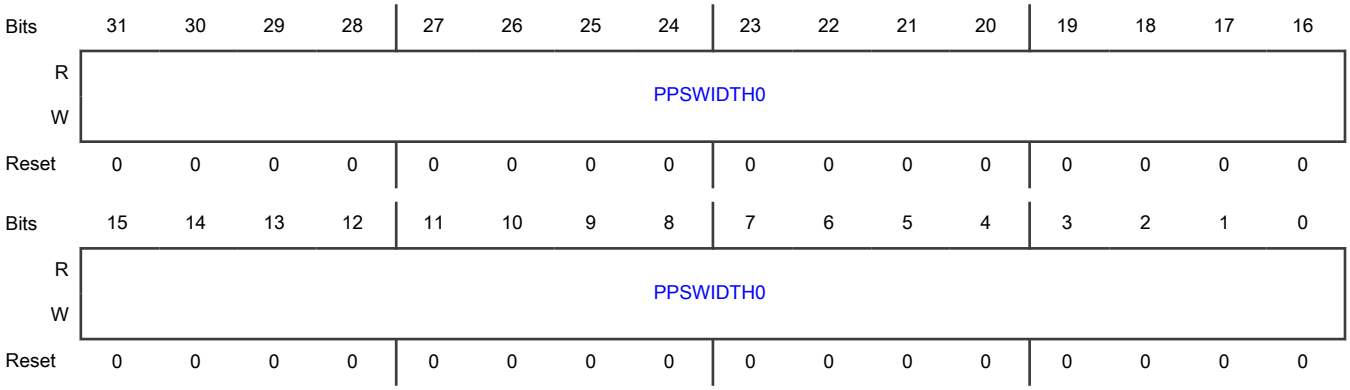
Offset

Register	Offset
MAC_PPS0_Width	B8Ch

Function

The PPS0 Width register contains the number of units of sub-second increment value between the rising and corresponding falling edges of PPS0 signal output (PTP_PPS_O[0]).

Diagram



Fields

Field	Function
31-0 PPSWIDTH0	PPS Output Signal Width These bits store the width between the rising edge and corresponding falling edge of PPS0 signal output. The width is stored in terms of number of units of sub-second increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS0 signal output is 80 ns (that is, four units of sub-second increment value), you should program value 3 (4-1) in this register. Note: The value programmed in this register must be lesser than the value programmed in MAC_PPS0_Interval.

76.17.245 MAC PPS1 Target Time In Seconds (MAC_PPS1_Target_Time_Seconds)

Offset

Register	Offset
MAC_PPS1_Target_Time_Seconds	B90h

Function

The PPS Target Time Seconds register, along with PPS Target Time Nanoseconds register, is used to schedule an interrupt event [Bit 1 of MAC_Timestamp_Status] when the system time exceeds the value programmed in these registers.

Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Counters Preset is disabled 1b - Counters Preset is enabled
7 —	Reserved
6-5 SCHALG	Tx Scheduling Algorithm This field indicates the algorithm for Tx scheduling: 00b - WRR algorithm 01b - WFQ algorithm when DCB feature is selected.Otherwise, Reserved 10b - DWRR algorithm when DCB feature is selected.Otherwise, Reserved 11b - Strict priority algorithm
4-3 —	Reserved
2 RAA	Receive Arbitration Algorithm This field is used to select the arbitration algorithm for the Rx side. - 0: Strict priority (SP). Queue 0 has the lowest priority and the last queue has the highest priority. - 1: Weighted Strict Priority (WSP) 0b - Strict priority (SP) 1b - Weighted Strict Priority (WSP)
1 DTXSTS	Drop Transmit Status - 1: Tx packet status received from the MAC is dropped in the MTL - 0: Tx packet status received from the MAC is forwarded to the application 0b - Drop Transmit Status is disabled 1b - Drop Transmit Status is enabled
0 —	Reserved

76.17.258 MTL Debus Control (MTL_DBG_CTL)

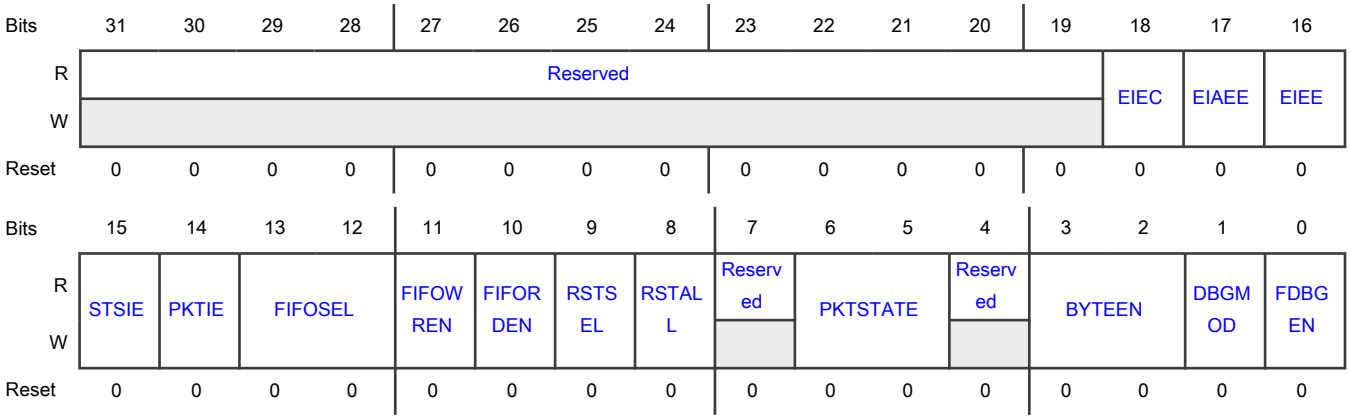
Offset

Register	Offset
MTL_DBG_CTL	C08h

Function

The FIFO Debug Access Control and Status register controls the operation mode of FIFO debug access.

Diagram



Fields

Field	Function
31-19 —	Reserved
18 EIEC	ECC Inject Error Control for Tx, Rx, TSO and DCACHE memories When EIEE or EIAEE bit of this register is set, following are the errors inserted based on the value encoded in this field. 0b - Insert 1 bit error 1b - insert 2 bit errors
17 EIAEE	ECC Inject Address Error for Tx, Rx, TSO and DCACHE memories - 1: Enables the ECC address error injection feature - 0: Disables the ECC address error injection feature 0b - Disables the ECC address error injection 1b - Enables the ECC address error injection
16 EIEE	ECC Inject Error Enable for Tx, Rx, TSO and DCACHE memories - 1: Enables the ECC error injection feature - 0: Disables the ECC error injection feature

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - ECC Inject Error for Tx, Rx, TSO and DCACHE memories is disabled 1b - ECC Inject Error for Tx, Rx, TSO and DCACHE memories is enabled
15 STSIE	Transmit Status Available Interrupt Status Enable When this bit is set, an interrupt is generated when Transmit status is available in slave mode. 0b - Transmit Packet Available Interrupt Status is disabled 1b - Transmit Packet Available Interrupt Status is enabled
14 PKTIE	Receive Packet Available Interrupt Status Enable When this bit is set, an interrupt is generated when EOP of received packet is written to the Rx FIFO. 0b - Receive Packet Available Interrupt Status is disabled 1b - Receive Packet Available Interrupt Status is enabled
13-12 FIFOSEL	FIFO Selected for Access This field indicates the FIFO selected for debug access. 00b - Tx FIFO 01b - Tx Status FIFO (only read access when SLVMOD is set)/ DC Memory FIFO read-write access when DBGMOD is set 10b - TSO FIFO (cannot be accessed when SLVMOD is set) 11b - Rx FIFO
11 FIFOWREN	FIFO Write Enable When this bit is set, it enables the Write operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0b - FIFO Write is disabled 1b - FIFO Write is enabled
10 FIFORDEN	FIFO Read Enable When this bit is set, it enables the Read operation on selected FIFO when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0b - FIFO Read is disabled 1b - FIFO Read is enabled
9 RSTSEL	Reset Pointers of Selected FIFO When this bit is set, the pointers of the currently-selected FIFO are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Reset Pointers of Selected FIFO is disabled 1b - Reset Pointers of Selected FIFO is enabled
8 RSTALL	Reset All Pointers When this bit is set, the pointers of all FIFOs are reset when FIFO Debug Access is enabled. This bit must not be written to 1 when FIFO Debug Access is not enabled, that is FDBGEN bit is 0. Access restriction applies. Self-cleared. Setting 0 clears. Setting 1 sets. 0b - Reset All Pointers is disabled 1b - Reset All Pointers is enabled
7 —	Reserved
6-5 PKTSTATE	Encoded Packet State This field is used to write the control information to the Tx FIFO or Rx FIFO. - Tx FIFO: -- 00: Packet Data -- 01: Control Word -- 10: SOP Data -- 11: EOP Data - Rx FIFO: -- 00: Packet Data -- 01: Normal Status -- 10: Last Status -- 11: EOP 00b - Packet Data 01b - Control Word/Normal Status 10b - SOP Data/Last Status 11b - EOP Data/EOP
4 —	Reserved
3-2 BYTEEN	Byte Enables This field indicates the number of data bytes valid in the data register during Write operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected. 00b - Byte 0 valid 01b - Byte 0 and Byte 1 are valid 10b - Byte 0, Byte 1, and Byte 2 are valid 11b - All four bytes are valid
1 DBGMOD	Debug Mode Access to FIFO - 1: Indicates that the current access to the FIFO is read, write, and debug access. In this mode, the following access types are allowed: -- Read and Write access to Tx FIFO, TSO FIFO, DCACHE FIFO and Rx FIFO -- Read access is allowed to Tx Status FIFO. - 0: Indicates that the current access to the FIFO is slave access bypassing the DMA. In this mode, the following access are allowed: -- Write access to the Tx FIFO -- Read access to the Rx FIFO and Tx Status FIFO 0b - Debug Mode Access to FIFO is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Debug Mode Access to FIFO is enabled
0 FDBGEN	FIFO Debug Access Enable - 1: Indicates that the debug mode access to the FIFO is enabled. - 0: Indicates that the FIFO can be accessed only through a master interface. 0b - FIFO Debug Access is disabled 1b - FIFO Debug Access is enabled

76.17.259 MTL Debus Status (MTL_DBG_STS)

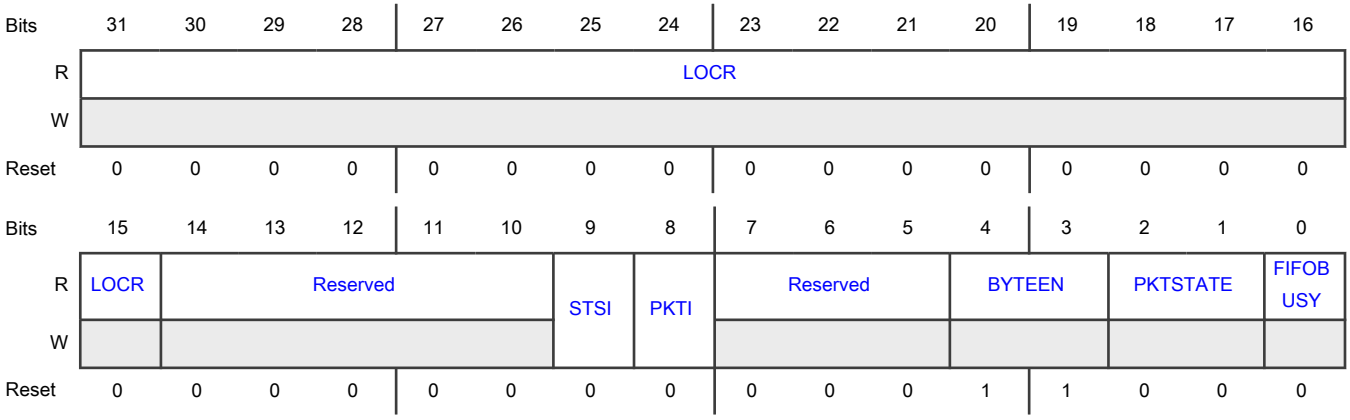
Offset

Register	Offset
MTL_DBG_STS	C0Ch

Function

The FIFO Debug Status register contains the status of FIFO debug access.

Diagram



Fields

Field	Function
31-15 LOCR	Remaining Locations in the FIFO - Slave Access Mode: This field indicates the space available in the selected FIFO. - Debug Access Mode: This field contains the Write or Read pointer value of the selected FIFO during Write or Read operation, respectively. - Reset: In single Tx Queue configurations, (DWC_EQOS_TXFIFO_SIZE/(DWC_EQOS_DATAWIDTH/8)), Otherwise 0000H

Table continues on the next page...

Table continued from the previous page...

Field	Function
14-10 —	Reserved
9 STSI	Transmit Status Available Interrupt Status When set, this bit indicates that the Slave mode Tx packet is transmitted, and the status is available in Tx Status FIFO. This bit is reset when 1 is written to this bit. 0b - Transmit Status Available Interrupt Status not detected 1b - Transmit Status Available Interrupt Status detected
8 PKTI	Receive Packet Available Interrupt Status When set, this bit indicates that MAC layer has written the EOP of received packet to the Rx FIFO. This bit is reset when 1 is written to this bit. 0b - Receive Packet Available Interrupt Status not detected 1b - Receive Packet Available Interrupt Status detected
7-5 —	Reserved
4-3 BYTEEN	Byte Enables This field indicates the number of data bytes valid in the data register during Read operation. This is valid only when PKTSTATE is 2'b10 (EOP) and Tx FIFO or Rx FIFO is selected. 00b - Byte 0 valid 01b - Byte 0 and Byte 1 are valid 10b - Byte 0, Byte 1, and Byte 2 are valid 11b - All four bytes are valid
2-1 PKTSTATE	Encoded Packet State This field is used to get the control or status information of the selected FIFO. - Tx FIFO: -- 00: Packet Data -- 01: Control Word -- 10: SOP Data -- 11: EOP Data - Rx FIFO: -- 00: Packet Data -- 01: Normal Status -- 10: Last Status -- 11: EOP This field is applicable only for Tx FIFO and Rx FIFO during Read operation. 00b - Packet Data 01b - Control Word/Normal Status 10b - SOP Data/Last Status 11b - EOP Data/EOP
0 FIFOBUSY	FIFO Busy When set, this bit indicates that a FIFO operation is in progress in the MAC and content of the following fields is not valid: - All other fields of this register - All fields of the MTL_FIFO_Debug_Data register

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - FIFO Busy not detected 1b - FIFO Busy detected

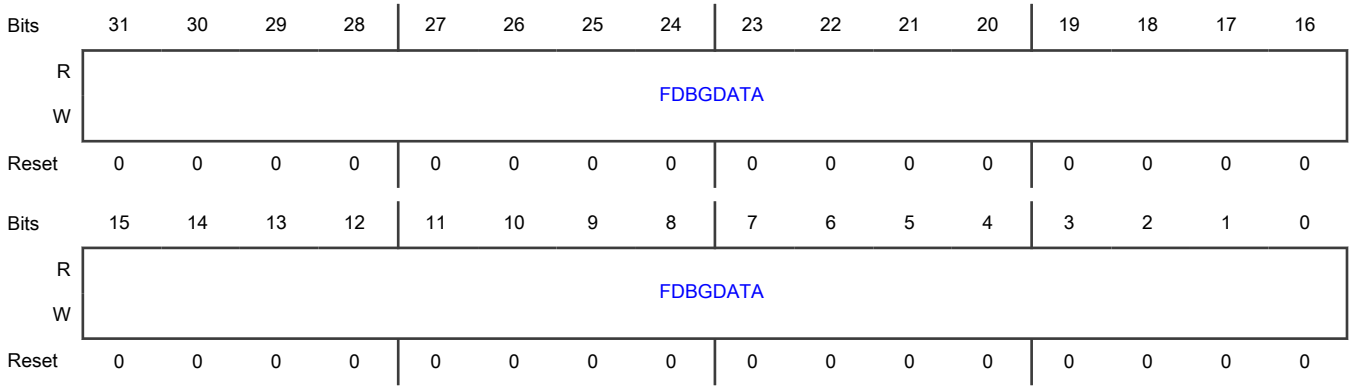
76.17.260 MTL FIFO Debug Data (MTL_FIFO_Debug_Data)

Offset

Register	Offset
MTL_FIFO_Debug_Data	C10h

Function
The FIFO Debug Data register contains the data to be written to or read from the FIFOs.

Diagram



Fields

Field	Function
31-0 FDBGDATA	FIFO Debug Data During debug or slave access write operation, this field contains the data to be written to the Tx FIFO, Rx FIFO, or TSO FIFO. During debug or slave access read operation, this field contains the data read from the Tx FIFO, Rx FIFO, TSO FIFO, or Tx Status FIFO.

76.17.261 MTL Interrupt Status (MTL_Interrupt_Status)

Offset

Register	Offset
MTL_Interrupt_Status	C20h

Function

The software driver (application) reads this register during interrupt service routine or polling to determine the interrupt status of MTL queues and the MAC.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

5 —	Reserved
4 —	Reserved
3 —	Reserved
2 Q2IS	Queue 2 Interrupt status This bit indicates that there is an interrupt from Queue 2. To reset this bit, the application must read the MTL_Q2_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0b - Queue 2 Interrupt status not detected 1b - Queue 2 Interrupt status detected
1 Q1IS	Queue 1 Interrupt status This bit indicates that there is an interrupt from Queue 1. To reset this bit, the application must read the MTL_Q1_Interrupt_Control_Status register to get the exact cause of the interrupt and clear its source. 0b - Queue 1 Interrupt status not detected 1b - Queue 1 Interrupt status detected
0 Q0IS	Queue 0 Interrupt status This bit indicates that there is an interrupt from Queue 0. To reset this bit, the application must read Queue 0 Interrupt Control and Status register to get the exact cause of the interrupt and clear its source. 0b - Queue 0 Interrupt status not detected 1b - Queue 0 Interrupt status detected

76.17.262 MTL Receive Queue DMA Map 0 (MTL_RxQ_DMA_Map0)

Offset

Register	Offset
MTL_RxQ_DMA_Map0	C30h

Function

The Receive Queue and DMA Channel Mapping 0 register is reserved in EQOS-CORE and EQOS-MTL configurations.

Diagram

23-21 —	Reserved
20 Q2DDMACH	Queue 2 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 2 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter

Table continues on the next page...

Table continued from the previous page...

Field	Function
	registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 2 are routed to the DMA Channel programmed in the Q2MDMACH field (Bits[18:16]). 0b - Queue 2 disabled for DA-based DMA Channel Selection 1b - Queue 2 enabled for DA-based DMA Channel Selection
19-18 —	Reserved
17-16 Q2MDMACH	Queue 2 Mapped to DMA Channel This field controls the routing of the received packet in Queue 2 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q2DDMACH field is reset.
15-13 —	Reserved
12 Q1DDMACH	Queue 1 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 1 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 1 are routed to the DMA Channel programmed in the Q1MDMACH field (Bits[10:8]). 0b - Queue 1 disabled for DA-based DMA Channel Selection 1b - Queue 1 enabled for DA-based DMA Channel Selection
11-10 —	Reserved
9-8 Q1MDMACH	Queue 1 Mapped to DMA Channel This field controls the routing of the received packet in Queue 1 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q1DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.
7-5 —	Reserved
4 Q0DDMACH	Queue 0 Enabled for DA-based DMA Channel Selection When set, this bit indicates that the packets received in Queue 0 are routed to a particular DMA channel as decided in the MAC Receiver based on the DMA channel number programmed in the L3-L4 filter registers, or the Ethernet DA address. When reset, this bit indicates that the packets received in Queue 0 are routed to the DMA Channel programmed in the Q0MDMACH field.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Queue 0 disabled for DA-based DMA Channel Selection 1b - Queue 0 enabled for DA-based DMA Channel Selection
3-2 —	Reserved
1-0 Q0MDMACH	Queue 0 Mapped to DMA Channel This field controls the routing of the packet received in Queue 0 to the DMA channel: - 000: DMA Channel 0 - 001: DMA Channel 1 - 010: DMA Channel 2 - 011: DMA Channel 3 - 100: DMA Channel 4 - 101: DMA Channel 5 - 110: DMA Channel 6 - 111: DMA Channel 7 This field is valid when the Q0DDMACH field is reset. The width of this field depends on the number of RX DMA channels and not all the values might be valid in some configurations. For example, if the number of RX DMA channels selected is 2, only 000 and 001 are valid, the other bits are reserved.

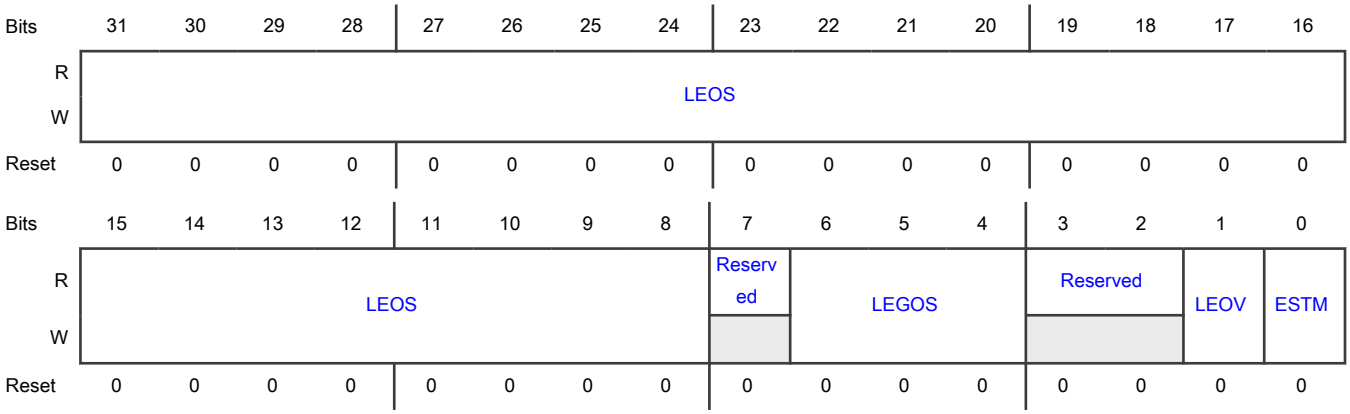
76.17.263 MTL TBS Control (MTL_TBS_CTRL)

Offset

Register	Offset
MTL_TBS_CTRL	C40h

Function
This register controls the operation of Time Based Scheduling.

Diagram



Fields

Field	Function
31-8	Launch Expiry Offset

Table continues on the next page...

Table continued from the previous page...

Field	Function
LEOS	The value in units of 256 nanoseconds that has to be added to the Launch time to compute the Launch Expiry time. Value valid only when LEOV is set. Max value: 999,999,999 ns, additionally should be smaller than CTR-1 value when ESTM mode is set since this value is a modulo CTR value.
7 —	Reserved
6-4 LEGOS	Launch Expiry GSN Offset The number GSN slots that has to be added to the Launch GSN to compute the Launch Expiry time. Value valid only when LEOV is set.
3-2 —	Reserved
1 LEOV	Launch Expiry Offset Valid When set indicates the LEOS field is valid. When not set, indicates the Launch Expiry Offset is not valid and the MTL must not check for Launch expiry time. 0b - LEOS field is invalid 1b - LEOS field is valid
0 ESTM	EST offset Mode When this bit is set, the Launch Time value used in Time Based Scheduling is interpreted as an EST offset value and is added to the Base Time Register (BTR) of the current list. When reset, the Launch Time value is used as an absolute value that should be compared with the System time [39:8]. 0b - EST offset Mode is disabled 1b - EST offset Mode is enabled

76.17.264 MTL EST Control (MTL_EST_Control)

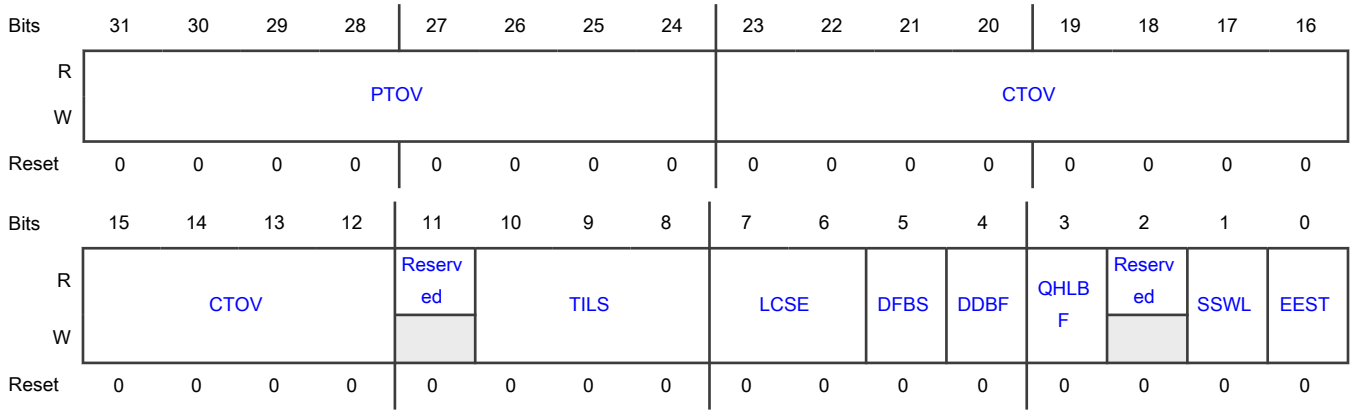
Offset

Register	Offset
MTL_EST_Control	C50h

Function

This register controls the operation of Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Diagram



Fields

Field	Function
31-24 PTOV	PTP Time Offset Value The value of PTP Clock period multiplied by 6 in nanoseconds. This value is needed to avoid transmission overruns at the beginning of the installation of a new GCL.
23-12 CTOV	Current Time Offset Value Provides a 12 bit time offset value in nano second that is added to the current time to compensate for all the implementation pipeline delays such as the CDC sync delay, buffering delays, data path delays and so on. This offset helps to ensure that the impact of gate controls is visible on the line exactly at the pre-determined schedule (or as close to the schedule as possible).
11 —	Reserved
10-8 TILS	Time Interval Left Shift Amount This field provides the left shift amount for the programmed Time Interval values used in the Gate Control Lists. - 000: No left shift needed (equal to x1ns) - 001: Left shift TI by 1 bit (equal to x2ns) - 010: Left shift TI by 2 bits (equal to x4ns) - . - . - 100: Left shift TI by 7 bits (equal to x128ns) Based on the configuration one or more bits of this field should be treated as Reserved/Read-Only.
7-6 LCSE	Loop Count to report Scheduling Error Programmable number of GCL list iterations before reporting an HLBS error defined in EST_Status register. 00b - 4 iterations 01b - 8 iterations 10b - 16 iterations 11b - 32 iterations
5 DFBS	Drop Frames causing Scheduling Error When set frames reported to cause HOL Blocking due to not getting scheduled (HLBS field of EST_Status register) after 4,8,16,32 (based on LCSE field of this register) GCL iterations are dropped.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Do not Drop Frames causing Scheduling Error 1b - Drop Frames causing Scheduling Error
4 DDBF	Do not Drop frames during Frame Size Error When set, frames are not be dropped during Head-of-Line blocking due to Frame Size Error (HLBF field of EST_Status register). 0b - Drop frames during Frame Size Error 1b - Do not Drop frames during Frame Size Error
3 QHLBF	Quick Assertion of HLBF Error When set, Time Window for Head-of-Line blocking due to Frame Size Error is 1 to 2 loop count of GCL list.On reset,Time Window for Head-of-Line blocking due to Frame Size Error is 2 to 3 loop counts of GCL list. 0b - Disable Quick assertion of HLBF error 1b - Quick Assertion of HLBF Error
2 —	Reserved
1 SSWL	Switch to S/W owned list When set indicates that the software has programmed that list that it currently owns (SWOL) and the hardware should switch to the new list based on the new BTR. Hardware clears this bit when the switch to the SWOL happens to indicate the completion of the switch or when an BTR error (BTRE in Status register) is set. When BTRE is set this bit is cleared but SWOL is not updated as the switch was not successful. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Switch to S/W owned list is disabled 1b - Switch to S/W owned list is enabled
0 EEST	Enable EST When reset, the gate control list processing is halted and all gates are assumed to be in Open state. Should be set for the hardware to start processing the gate control lists. During the toggle from 0 to 1, the gate control list processing starts only after the SSWL bit it set. When DWC_EQOS_ASP_ECC is selected during the configuration, if any uncorrectable error is detected in the EST memory the hardware resets this bit and disables the EST function. 0b - EST is disabled 1b - EST is enabled

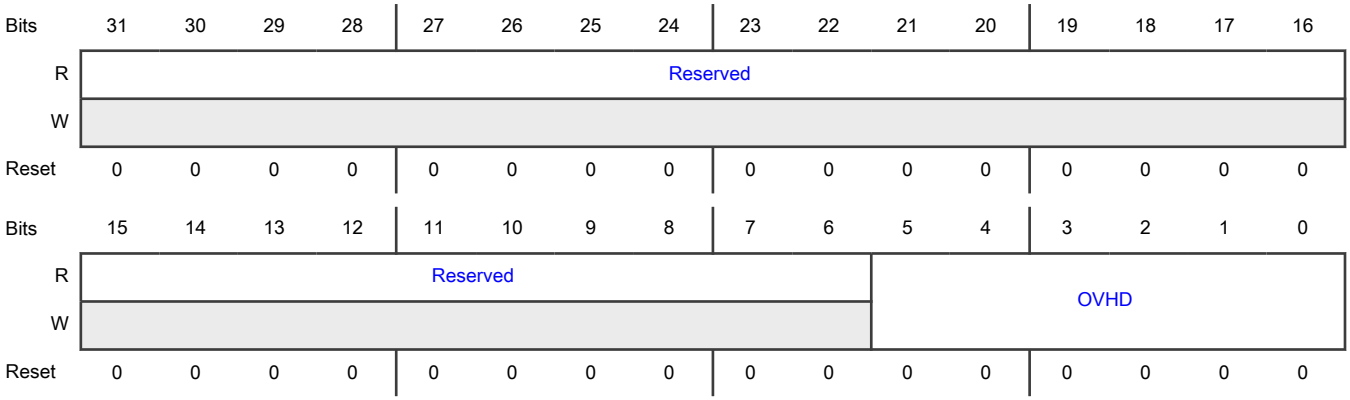
76.17.265 MTL EST Extended Control (MTL_EST_Ext_Control)

Offset

Register	Offset
MTL_EST_Ext_Control	C54h

Function
This register indicates the number of Overhead bytes for EST related scheduling.

Diagram



Fields

Field	Function
31-6 —	Reserved
5-0 OVHD	Overhead Bytes Value This field indicates the fixed overhead for every packet to account for EST Scheduler Delay, IPG or EIPG, and Preamble bytes.

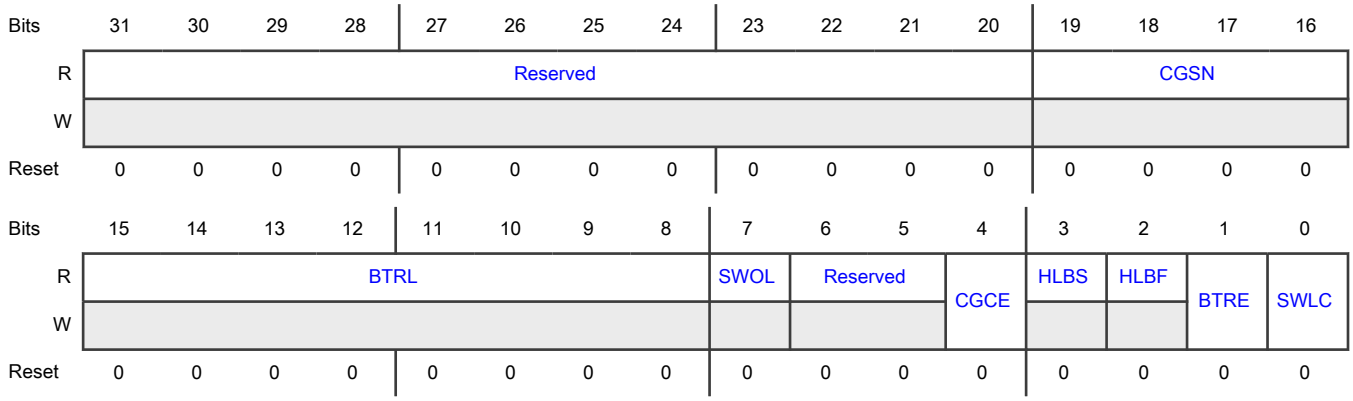
76.17.266 MTL EST Status (MTL_EST_Status)

Offset

Register	Offset
MTL_EST_Status	C58h

Function
This register provides Status related to Enhancements to Scheduled Transmission (IEEE802.1Qbv).

Diagram



Fields

Field	Function
31-20 —	Reserved
19-16 CGSN	Current GCL Slot Number Indicates the slot number of the GCL list. Slot number is a modulo 16 count of the GCL List loops executed so far. Even if a new GCL list is installed, the count is incremental.
15-8 BTRL	BTR Error Loop Count Provides the minimum count (N) for which the equation Current Time =< New BTR + (N * New Cycle Time) becomes true. N = "11111111" indicates the iterations exceeded the value of 128 and the hardware was not able to update New BTR to be equal to or greater than Current Time. Software intervention is needed to update the New BTR. Value cleared when BTRE field of this register is cleared.
7 SWOL	S/W owned list When '0' indicates Gate control list number "0" is owned by software and when "1" indicates the Gate Control list "1" is owned by the software. Any reads/writes by the software (using indirect access through GCL_Control) is directed to the list indicated by this value by default. The inverse of this value is treated as HWOL. R/W operations performed by hardware are directed to the list pointed by HWOL by default. 0b - Gate control list number "0" is owned by software 1b - Gate control list number "1" is owned by software
6-5 —	Reserved
4 CGCE	Constant Gate Control Error This error occurs when the list length (LLR) is 1 and the Cycle Time (CTR) is less than or equal to the programmed Time Interval (TI) value after the optional Left Shifting. This implies, Gates are either always Closed or always Open based on the Gate Control values; the same effect can be achieved by other simpler (non TSN) programming mechanisms. Since the implementation does not support such a programming an error is reported. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Constant Gate Control Error not detected 1b - Constant Gate Control Error detected
3 HLBS	Head-Of-Line Blocking due to Scheduling Set when the frame is not able to win arbitration and get scheduled even after 4 iterations of the GCL. Indicates to software a potential programming error. The one hot encoded values of the Queue Numbers that are not able to make progress are indicated in the MTL_EST_Sch_Error register. Bit cleared when MTL_EST_Sch_Error register is all zeros. 0b - Head-Of-Line Blocking due to Scheduling not detected 1b - Head-Of-Line Blocking due to Scheduling detected
2 HLBF	Head-Of-Line Blocking due to Frame Size Set when HOL Blocking is noticed on one or more Queues as a result of none of the Time Intervals of gate open in the GCL being greater than or equal to the duration needed for frame size (or frame fragment size when preemption is enabled) transmission. The one hot encoded Queue numbers that are experiencing HLBF are indicated in the MTL_EST_Frm_Size_Error register. Additionally, the first Queue number that experienced HLBF along with the frame size is captured in MTL_EST_Frm_Size_Capture register. Bit cleared when MTL_EST_Frame_Size_ Error register is all zeros. 0b - Head-Of-Line Blocking due to Frame Size not detected 1b - Head-Of-Line Blocking due to Frame Size detected
1 BTRE	BTR Error When "1" indicates a programming error in the BTR of SWOL where the programmed value is less than current time. If the BTRL = "11111111", SWOL is not updated and software should reprogram the BTR to a value greater than current time and then set SSWL to reinitiate the switch to SWOL. Else if the value of BTRL < "11111111", SWOL is updated and this field indicates the number of iterations (of + CycleTime) taken by hardware to update the BTR to a value greater than Current Time. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - BTR Error not detected 1b - BTR Error detected
0 SWLC	Switch to S/W owned list Complete When "1" indicates the hardware has successfully switched to the SWOL, and the SWOL bit has been updated to that effect. Cleared when the SSWL of EST_Control register transitions from 0 to 1, or on a software write. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Switch to S/W owned list Complete not detected 1b - Switch to S/W owned list Complete detected

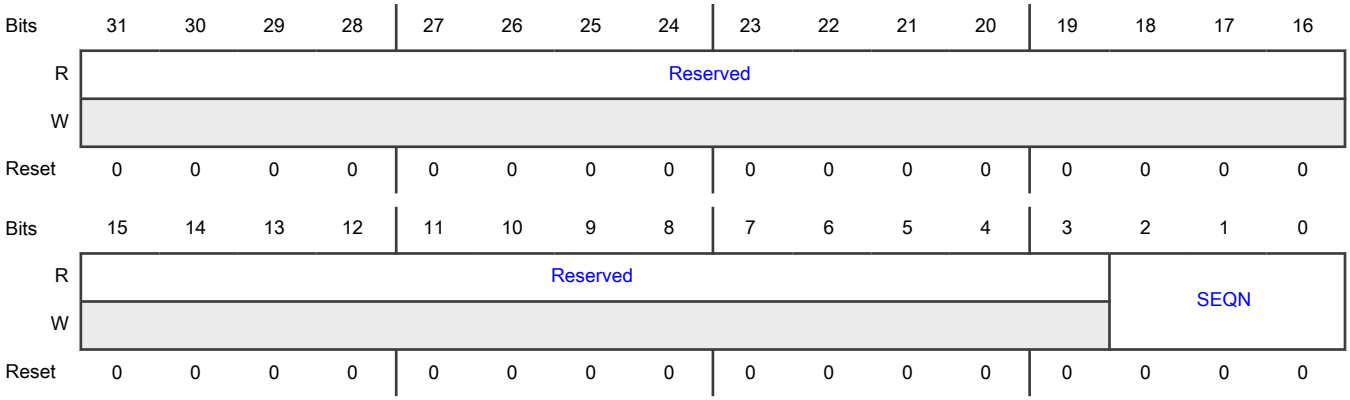
76.17.267 MTL EST Scheduling Error (MTL_EST_Sch_Error)

Offset

Register	Offset
MTL_EST_Sch_Error	C60h

Function
This register provides the One Hot encoded Queue Numbers that are having the Scheduling related error (timeout).

Diagram



Fields

Field	Function
31-3 —	Reserved
2-0 SEQN	Schedule Error Queue Number The One Hot Encoded Queue Numbers that have experienced error/timeout described in HLBS field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

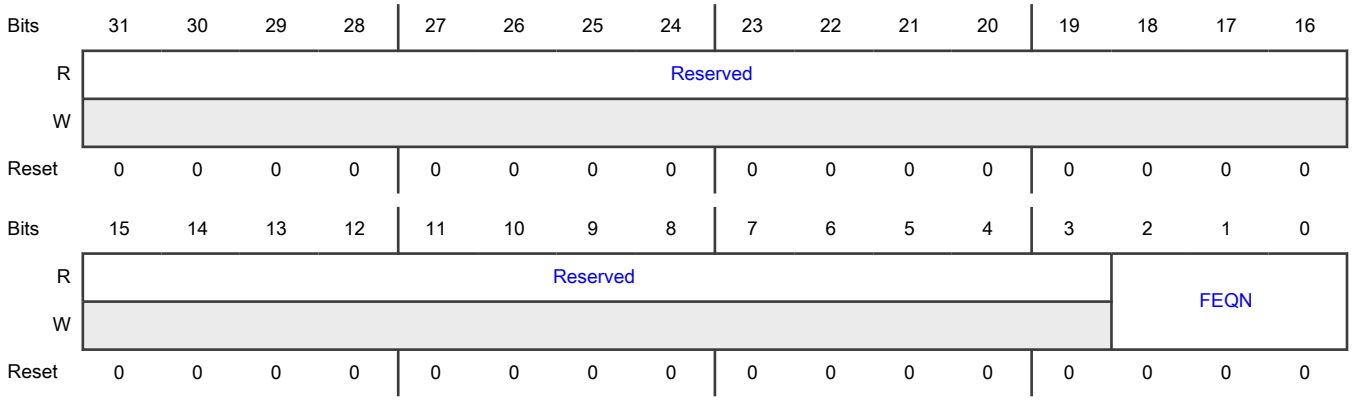
76.17.268 MTL EST Frame Size Error (MTL_EST_Frm_Size_Error)

Offset

Register	Offset
MTL_EST_Frm_Size_Error	C64h

Function
This register provides the One Hot encoded Queue Numbers that are having the Frame Size related error.

Diagram



Fields

Field	Function
31-3 —	Reserved
2-0 FEQN	Frame Size Error Queue Number The One Hot Encoded Queue Numbers that have experienced error described in HLBF field of status register. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect.

76.17.269 MTL EST Frame Size Capture (MTL_EST_Frm_Size_Capture)

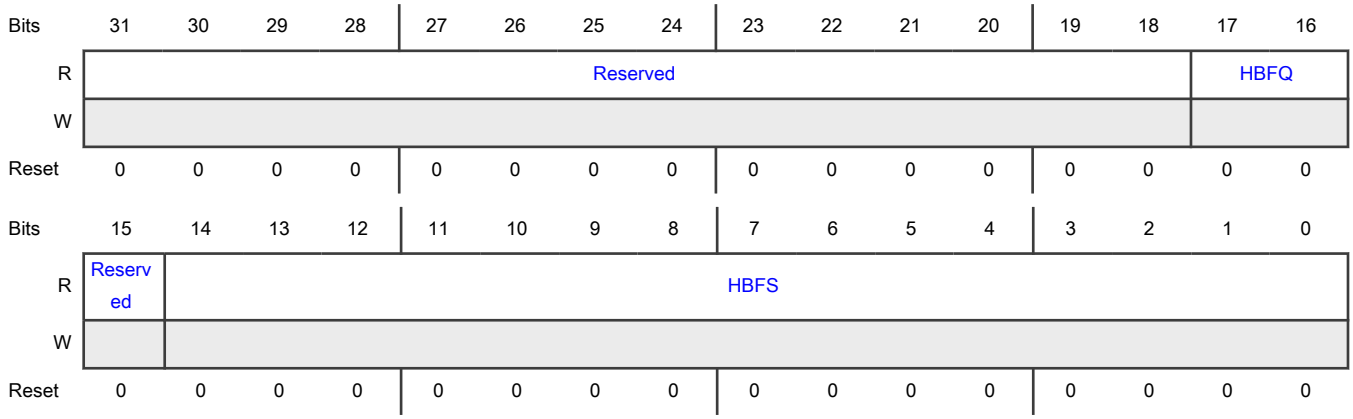
Offset

Register	Offset
MTL_EST_Frm_Size_Capture	C68h

Function

This register captures the Frame Size and Queue Number of the first occurrence of the Frame Size related error. Up on clearing it captures the data of immediate next occurrence of a similar error.

Diagram



Fields

Field	Function
31-18 —	Reserved
17-16 HBFQ	Queue Number of HLBF Captures the binary value of the of the first Queue (number) experiencing HLBF error (see HLBF field of status register). Value once written is not altered by any subsequent queue errors of similar nature. Once cleared the queue number of the next occurring HLBF error is captured. Width is based on the number of Tx Queues configured; remaining bits are Read-Only. Cleared when MTL_EST_Frm_Size_Error register is all zeros.
15 —	Reserved
14-0 HBFS	Frame Size of HLBF Captures the Frame Size of the dropped frame related to queue number indicated in HBFQ field of this register. Contents of this register should be considered invalid, if this field is zero. Cleared when MTL_EST_Frm_Size_Error register is all zeros.

76.17.270 MTL EST Interrupt Enable (MTL_EST_Intr_Enable)

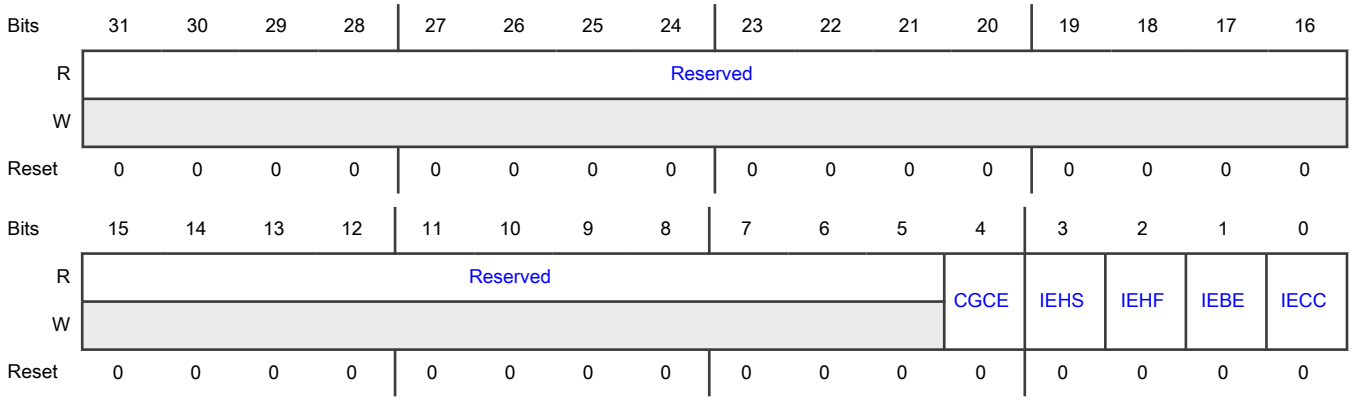
Offset

Register	Offset
MTL_EST_Intr_Enable	C70h

Function

This register implements the Interrupt Enable bits for the various events that generate an interrupt. Bit positions have a 1 to 1 correlation with the status bit positions in MTL_ETS_Status register.

Diagram



Fields

Field	Function
31-5 —	Reserved
4 CGCE	Interrupt Enable for CGCE When set, generates interrupt when the Constant Gate Control Error occurs and is indicated in the status. When reset this event does not generate an interrupt 0b - Interrupt for CGCE is disabled 1b - Interrupt for CGCE is enabled
3 IEHS	Interrupt Enable for HLBS When set, generates interrupt when the Head-of-Line Blocking due to Scheduling issue and is indicated in the status. When reset this event does not generate an interrupt. 0b - Interrupt for HLBS is disabled 1b - Interrupt for HLBS is enabled
2 IEHF	Interrupt Enable for HLBF When set, generates interrupt when the Head-of-Line Blocking due to Frame Size error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0b - Interrupt for HLBF is disabled 1b - Interrupt for HLBF is enabled
1 IEBE	Interrupt Enable for BTR Error When set, generates interrupt when the BTR Error occurs and is indicated in the status. When reset this event does not generate an interrupt. 0b - Interrupt for BTR Error is disabled 1b - Interrupt for BTR Error is enabled
0	Interrupt Enable for Switch List

Table continues on the next page...

Table continued from the previous page...

Field	Function
IECC	When set, generates interrupt when the configuration change is successful and the hardware has switched to the new list. When reset this event does not generate an interrupt. 0b - Interrupt for Switch List is disabled 1b - Interrupt for Switch List is enabled

76.17.271 MTL EST GCL Control (MTL_EST_GCL_Control)

Offset

Register	Offset
MTL_EST_GCL_Control	C80h

Function

This register provides the control information for reading/writing to the Gate Control lists.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-24 —	Reserved
23 ESTEIEC	ECC Inject Error Control for EST Memory When ESTEIEE or ESTEIAEE bit of this register is set, following are the errors inserted based on the value encoded in this field. This field is valid only if DWC_EQOS_ASP_ECC feature is selected during the configuration, else it is reserved. 0b - Insert 1 bit error 1b - Insert 2 bit errors

Table continues on the next page...

Table continued from the previous page...

Field	Function
22 ESTEIAEE	EST ECC Inject Address Error Enable When set along with EEST bit of MTL_EST_Control register, enables the ECC address error injection feature. When reset, disables the ECC address error injection feature. 0b - EST ECC Inject Address Error is disabled 1b - EST ECC Inject Address Error is enabled
21 ESTEIEE	EST ECC Inject Error Enable When set along with EEST bit of MTL_EST_Control register, enables the ECC error injection feature. When reset, disables the ECC error injection feature. 0b - EST ECC Inject Error is disabled 1b - EST ECC Inject Error is enabled
20-16 —	Reserved
15-8 ADDR	Gate Control List Address: (GCLA when GCRR is "0"). Provides the address (row number) of the Gate Control List at which the R/W operation has to be performed. By default the Gate Control List pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. The width of this field is dependent on DWC_EQOS_EST_DEP; unused bits should be treated as read only. Gate Control List Related Registers Address: (GCRA when GCRR is "1"). By default the GCL related register set pointed by SWOL of MTL_EST_Status is selected for R/W, however if the DBGM bit of this register is set, a debug mode access is given to R/W from DBGB. Lower 3 bits are only used in this mode, higher order bits are treated as dont cares. - 000: BTR Low (31:0) - 001: BTR High (63:31) - 010: CTR Low (31:0) - 011: CTR High (39:32) - 100: TER (31:0) - 101: LLR (n:0) (where n is (log{DWC_EQOS_EST_DEP} / log2)) - Others: Reserved
7-6 —	Reserved
5 DBGB	Debug Mode Bank Select When set to "0" indicates R/W in debug mode should be directed to Bank 0 (GCL0 and corresponding Time related registers). When set to "1" indicates R/W in debug mode should be directed to Bank 1 (GCL1 and corresponding Time related registers). This value is used when DBGM is set and overrides by value of SWOL which is normally used. 0b - R/W in debug mode should be directed to Bank 0 1b - R/W in debug mode should be directed to Bank 1
4 DBGM	Debug Mode When set to "1" indicates R/W in debug mode where the memory bank (for GCL and Time related registers) is explicitly provided by DBGB value, when set to "0" SWOL bit is used to determine which bank to use.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Debug Mode is disabled 1b - Debug Mode is enabled
3 —	Reserved
2 GCRR	Gate Control Related Registers When set to "1" indicates the R/W access is for the GCL related registers (BTR, CTR, TER, LLR) whose address is provided by GCRA. When "0" indicates R/W should be directed to GCL from the address provided by GCLA. 0b - Gate Control Related Registers are disabled 1b - Gate Control Related Registers are enabled
1 R1W0	Read '1', Write '0': - 1: Read operation - 0: Write operation. 0b - Write Operation 1b - Read Operation
0 SRWO	Start Read/Write Op - 1: Indicates the start/progress of a Read/Write operation. - Reset by hardware: Indicates the R/W operation has completed or an error has occurred (when bit 20 is set) - Reads: Data can be read from MTL_EST_GCL_Data register after this bit is reset - Writes: MTL_EST_GCL_Data should be programmed with write data before setting SRWO. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Start Read/Write Op disabled 1b - Start Read/Write Op enabled

76.17.272 MTL EST GCL Data (MTL_EST_GCL_Data)

Offset

Register	Offset
MTL_EST_GCL_Data	C84h

Function

This register holds the read data or write data in case of reads and writes respectively.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-29 —	Reserved
28 HRS	Hold/Release Status - 1: Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State. - 0: Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State. 0b - Indicates a Set-and-Release-MAC operation was last executed and the pMAC is in Release State 1b - Indicates a Set-and-Hold-MAC operation was last executed and the pMAC is in Hold State
27-16 —	Reserved
15-11 —	Reserved
10-8 PEC	Preemption Classification When set indicates the corresponding Queue must be classified as preemptable, when '0' Queue is classified as express. When both EST (Qbv) and Preemption are enabled, Queue-0 is always assumed to be preemptable. When EST (Qbv) is enabled Queues categorized as preemptable here are always assumed to be in "Open" state in the Gate Control List.
7-2 —	Reserved
1-0 AFSZ	Additional Fragment Size used to indicate, in units of 64 bytes, the minimum number of bytes over 64 bytes required in non-final fragments of preempted frames. The minimum non-final fragment size is (AFSZ +1) * 64 bytes

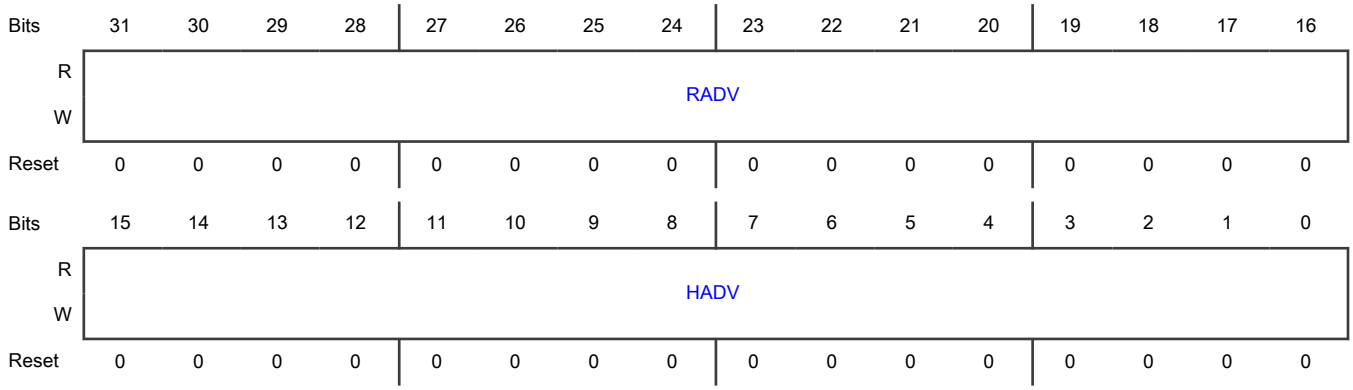
76.17.274 MTL FPE Advance (MTL_FPE_Advance)

Offset

Register	Offset
MTL_FPE_Advance	C94h

Function
This register holds the Hold and Release Advance time.

Diagram



Fields

Field	Function
31-16 RADV	Release Advance The maximum time in nanoseconds that can elapse between issuing a RELEASE to the MAC and the MAC being ready to resume transmission of preemptable frames, in the absence of there being any express frames available for transmission.
15-0 HADV	Hold Advance The maximum time in nanoseconds that can elapse between issuing a HOLD to the MAC and the MAC ceasing to transmit any preemptable frame that is in the process of transmission or any preemptable frames that are queued for transmission.

76.17.275 MTL Rx Parser Control Status (MTL_RXP_Control_Status)

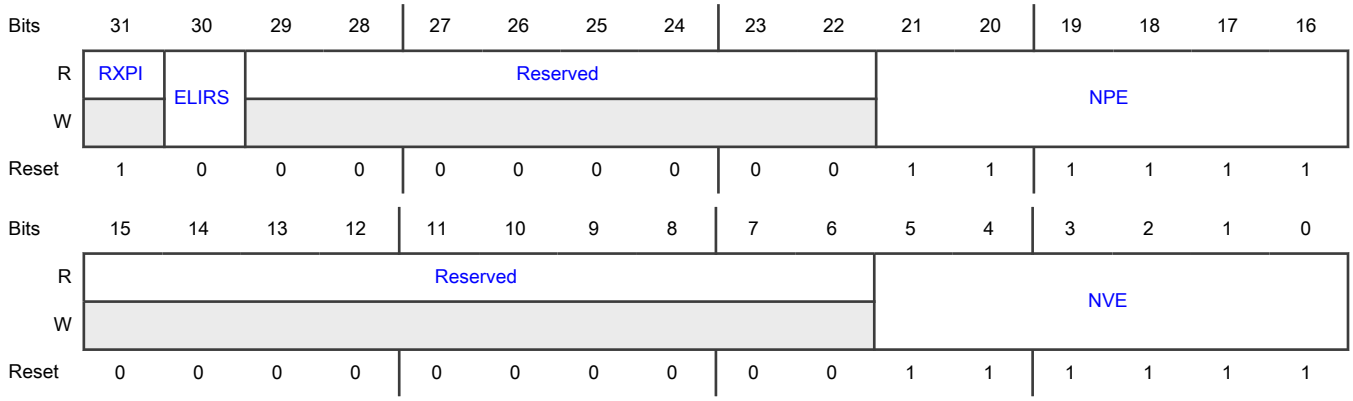
Offset

Register	Offset
MTL_RXP_Control_Status	CA0h

Function

The MTL_RXP_Control_Status register establishes the operating mode of Rx Parser and provides some status.

Diagram



Fields

Field	Function
31 RXPI	RX Parser in Idle state This status bit is set to 1 when the Rx parser is in Idle State and waiting for a new packet for processing. This bit is used as a handshake with software when parser gets disables. After disabling, when bit is set then software can update the Rx parser instruction table. 0b - RX Parser not in Idle state 1b - RX Parser in Idle state
30 ELIRS	Enable Last Instruction in RX Status When this bit is set, RDES2[31:16] indicates the index of the last instruction excecuted in Rx Parse, when set to 0 indicates MAC filter status.
29-22 —	Reserved
21-16 NPE	Number of parsable entries in the Instruction table This control indicates the number of parsable entries in the Instruction Memory. This is used in Rx parser logic to detect programming Error. In case number of parsed entries for a packet is more than this entry then NPEOVIS bit in the MTL_RXP_Interrupt_Control_Status register is set.
15-6 —	Reserved
5-0 NVE	Number of valid entry address/index in the Instruction table This control indicates the number of valid entries address/index in the Instruction Memory (i.e. when NVE field in register=31, the maximum valid entry address is NVE+1 i.e. addresses/indices=0 to 32, or 33 entries). This is used in Rx parser logic to detect any programming Error. In case while parsing Table address (memory address) found to be more than this maximum valid entry address then NVEOVIS bit in the MTL_RXP_Interrupt_Control_Status register is set. Note: The minimum value of this should be 2.

76.17.276 MTL Rx Parser Interrupt Control Status (MTL_RXP_Interrupt_Control_Status)

Offset

Register	Offset
MTL_RXP_Interrupt_Control_Status	CA4h

Function

The MTL_RXP_Interrupt_Control_Status registers provides enable control for the interrupts and provides interrupt status.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	Reserved												PDRFIS	FOOVIS	NPEOVIS	NVEOVIS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-20 —	Reserved
19 PDRFIE	Packet Drop due to RF Interrupt Enable When this bit is set, the PDRFIS interrupt is enabled. When this bit is reset, the PDRFIS interrupt is disabled. 0b - Packet Drop due to RF Interrupt is disabled 1b - Packet Drop due to RF Interrupt is enabled
18 FOOVIE	Frame Offset Overflow Interrupt Enable When this bit is set, the FOOVIS interrupt is enabled. When this bit is reset, the FOOVIS interrupt is disabled. 0b - Frame Offset Overflow Interrupt is disabled 1b - Frame Offset Overflow Interrupt is enabled
17 NPEOVIE	Number of Parsable Entries Overflow Interrupt Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this bit is set, the NPEOVIS interrupt is enabled. When this bit is reset, the NPEOVIS interrupt is disabled. 0b - Number of Parsable Entries Overflow Interrupt is disabled 1b - Number of Parsable Entries Overflow Interrupt is enabled
16 NVEOVIE	Number of Valid Entries Overflow Interrupt Enable When this bit is set, the NVEOVIS interrupt is enabled. When this bit is reset, the NVEOVIS interrupt is disabled. 0b - Number of Valid Entries Overflow Interrupt is disabled 1b - Number of Valid Entries Overflow Interrupt is enabled
15-4 —	Reserved
3 PDRFIS	Packet Dropped due to RF Interrupt Status If the Rx Parser result says to drop the packet by setting RF=1 in the instruction memory, then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Packet Dropped due to RF Interrupt Status not detected 1b - Packet Dropped due to RF Interrupt Status detected
2 FOOVIS	Frame Offset Overflow Interrupt Status While parsing if the Instruction table entry's 'Frame Offset' found to be more than EOF offset, then then this bit is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Frame Offset Overflow Interrupt Status not detected 1b - Frame Offset Overflow Interrupt Status detected
1 NPEOVIS	Number of Parsable Entries Overflow Interrupt Status While parsing a packet if the number of parsed entries found to be more than NPE[] (Number of Parseable Entries in MTL_RXP_Control register),then this bit is set to 1. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Number of Parsable Entries Overflow Interrupt Status not detected 1b - Number of Parsable Entries Overflow Interrupt Status detected
0 NVEOVIS	Number of Valid Entry Address/Index Overflow Interrupt Status While parsing if the Instruction address found to be more than NVE (Number of Valid Entry Address/ index in MTL_RXP_Control register), then this bit is set to 1. For example, when NVE field in register=31, the maximum valid entry address/index is NVE+1 i.e. 32 (addresses/indices=0 to 32, or 33 entries), so NVEOVIS is set when currently processed entry indicates next address is 33 or more i.e. 34th or later

Table continues on the next page...

Table continued from the previous page...

Field	Function
	entries. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Number of Valid Entries Overflow Interrupt Status not detected 1b - Number of Valid Entries Overflow Interrupt Status detected

76.17.277 MTL Rx Parser Drop Count (MTL_RXP_Drop_Cnt)

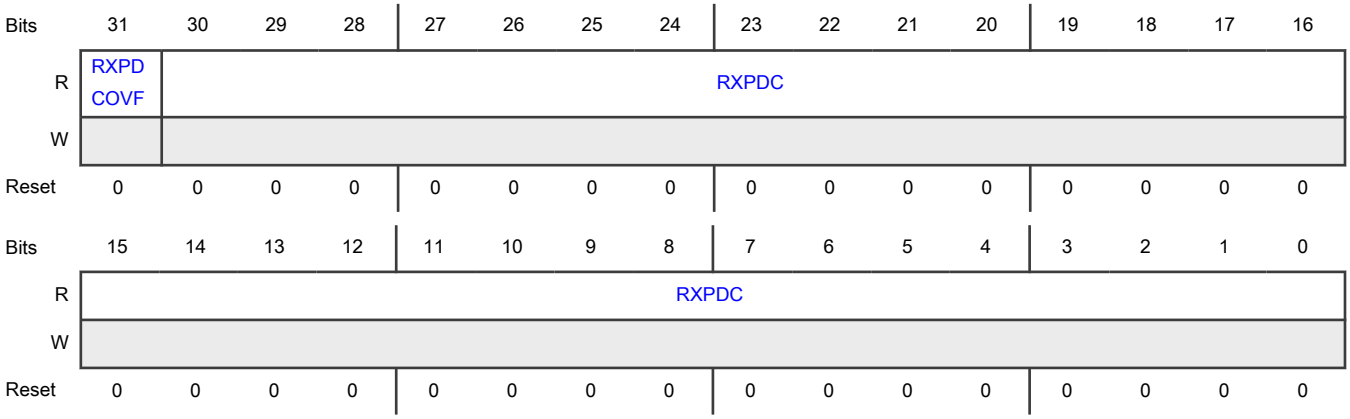
Offset

Register	Offset
MTL_RXP_Drop_Cnt	CA8h

Function

The MTL_RXP_Drop_Cnt register provides the drop count of Rx Parser initiated drops.

Diagram



Fields

Field	Function
31 RXPDCOVF	Rx Parser Drop Counter Overflow Bit When set, this bit indicates that the MTL_RXP_Drop_cnt (RXPDC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Rx Parser Drop count overflow not occurred 1b - Rx Parser Drop count overflow occurred
30-0 RXPDC	Rx Parser Drop count This 31-bit counter is implemented when a Rx Parser Drops a packet due to RF =1. The counter is cleared when the register is read.

76.17.278 MTL Rx Parser Error Count (MTL_RXP_Error_Cnt)

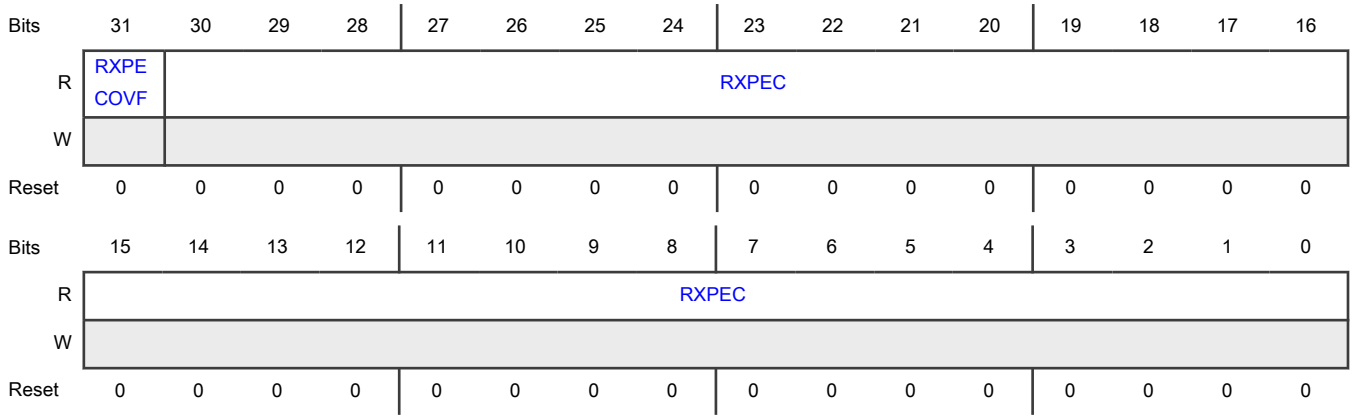
Offset

Register	Offset
MTL_RXP_Error_Cnt	CACh

Function

The MTL_RXP_Error_Cnt register provides the Rx Parser related error occurrence count.

Diagram



Fields

Field	Function
31 RXPECOVF	Rx Parser Error Counter Overflow Bit When set, this bit indicates that the MTL_RXP_Error_cnt (RXPEC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Rx Parser Error count overflow not occurred 1b - Rx Parser Error count overflow occurred
30-0 RXPEC	Rx Parser Error count This 31-bit counter is implemented whenr a Rx Parser encounters following Error scenarios - Entry address >= NVE[] - Number Parsed Entries >= NPE[] - Entry address > EOF data entry address The counter is cleared when the register is read.

76.17.279 MTL Rx Parser Indirect Access Control Status (MTL_RXP_Indirect_Acc_Control_Status)

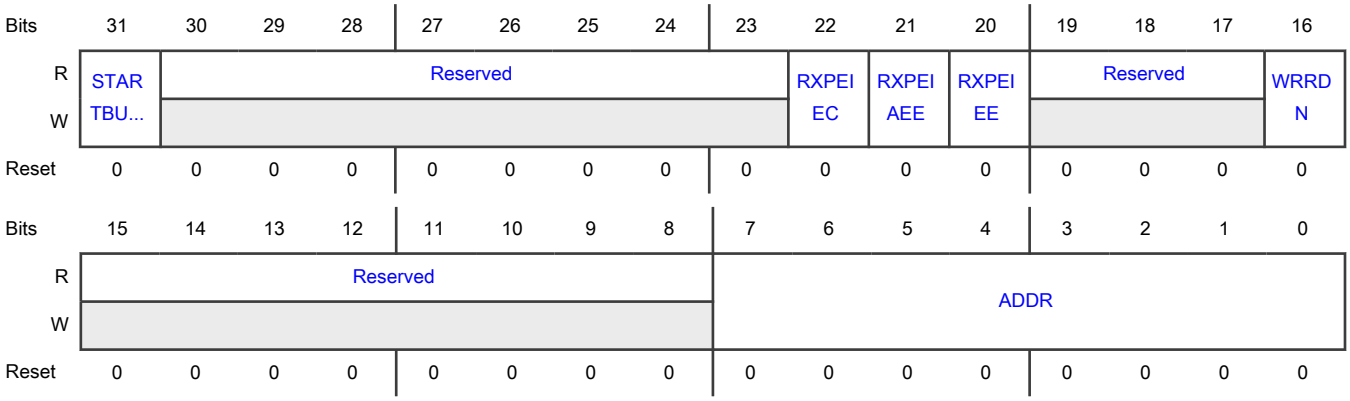
Offset

Register	Offset
MTL_RXP_Indirect_Acc_Control_Status	CB0h

Function

The MTL_RXP_Indirect_Acc_Control_Status register provides the Indirect Access control and status for Rx Parser memory.

Diagram



Fields

Field	Function
31 STARTBUSY	FRP Instruction Table Access Busy - Set to 1 by the software, indicates to start the Read/Write operation from/to the Rx Parser Memory. Software should read this bit as 0 before issuing read or write request to access the Parser Memory Instructions. - Set to 1 by the IP, indicates that the IP is busy until it is cleared by the IP. Software should not issue read or write operation. 0b - hardware not busy 1b - hardware is busy (Read/Write operation from/to the Rx Parser Memory)
30-23 —	Reserved
22 RXPEIEC	ECC Inject Error Control for Rx Parser Memory When RXPEIEE or RXPEIAEE bit of this register is set, following are the errors inserted based on the value encoded in this field: - 1: Insert 1 bit error. - 0: Insert 2 bit errors. 0b - Insert 1 bit error 1b - Insert 2 bit errors
21 RXPEIAEE	ECC Inject Address Error Enable for Rx Parser Memory - 1: Enables the ECC address error injection feature. - 0: Disables the ECC address error injection feature. 0b - ECC Inject Address Error for Rx Parser Memory is disabled 1b - ECC Inject Address Error for Rx Parser Memory is enabled
20 RXPEIEE	ECC Inject Error Enable for Rx Parser Memory - 1: Enables the ECC error injection feature. - 0: Disables the ECC error injection feature.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - ECC Inject Error for Rx Parser Memory is disabled 1b - ECC Inject Error for Rx Parser Memory is enabled
19-17 —	Reserved
16 WRRDN	Read Write Control - 1: Indicates the write operation to the Rx Parser Memory. - 0: Indicates the read operation to the Rx Parser Memory. 0b - Read operation to the Rx Parser Memory 1b - Write operation to the Rx Parser Memory
15-8 —	Reserved
7-0 ADDR	FRP Instruction Table Offset Address This field indicates the ADDR of the 32-bit entry in Rx parser instruction table. Each entry has 128-bit (4x32-bit words). The X is based on the configurable DWC_EQOS_FRP_ENTRIES. If DWC_EQOS_FRP_ENTRIES is - 256: X = 9 - 128: X = 8 - 64: X = 7

76.17.280 MTL Rx Parser Indirect Access Data (MTL_RXP_Indirect_Acc_Data)

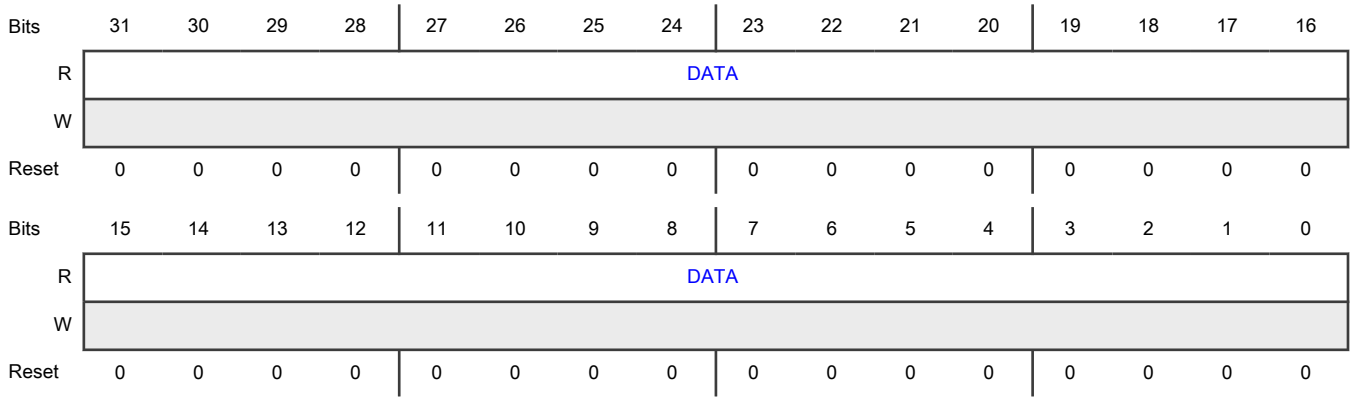
Offset

Register	Offset
MTL_RXP_Indirect_Acc_Data	CB4h

Function

The MTL_RXP_Indirect_Acc_Data registers holds the data associated to Indirect Access to Rx Parser memory.

Diagram



Fields

Field	Function
31-0 DATA	FRP Instruction Table Write/Read Data Software should write this register before issuing any write command. The hardware provides the read data from the Rx Parser Memory for read operation when STARTBUSY =0 after read command.

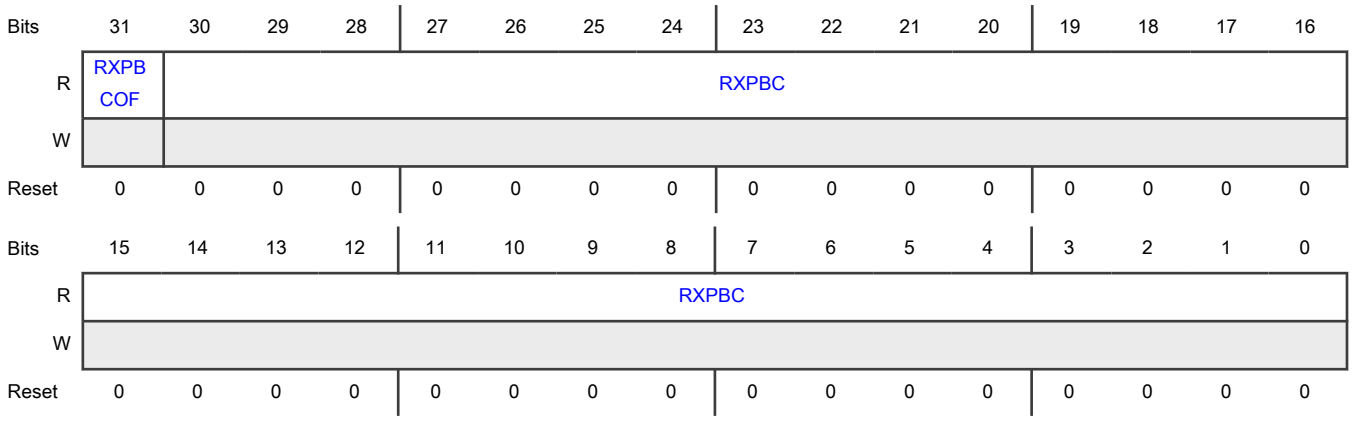
76.17.281 MTL Rx Parser Bypass Count (MTL_RXP_Bypass_Cnt)

Offset

Register	Offset
MTL_RXP_Bypass_Cnt	CB8h

Function
The MTL_RXP_Bypass_Cnt register provides the bypass count of Rx Parser.

Diagram



Fields

Field	Function
31 RXPBCOF	Rx Parser bypass Counter Overflow Bit When set, this bit indicates that the MTL_RXP_Bypass_cnt (RXPBC) Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Rx Parser Bypass count overflow not occurred 1b - Rx Parser Bypass count overflow occurred
30-0 RXPBC	Rx Parser Bypass count This 31-bit counter is implemented when a Rx Parser bypass a packet due to AF=1 and RF =1. The counter is cleared when the register is read.

76.17.282 MTL ECC Control (MTL_ECC_Control)

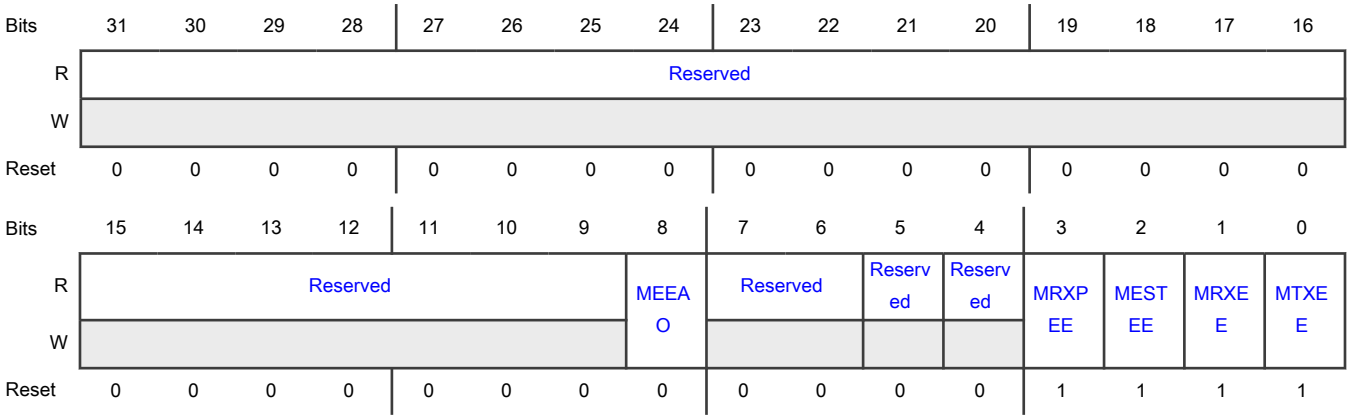
Offset

Register	Offset
MTL_ECC_Control	CC0h

Function

The MTL_ECC_Control register establishes the operating mode of ECC related to MTL memories.

Diagram



Fields

Field	Function
31-9 —	Reserved
8 MEEAO	MTL ECC Error Address Status Over-ride - 1: The EUEAS/ECEAS field of MTL_ECC_Err_Addr_Status register holds the last valid address where the error is detected. - 0: The EUEAS/ECEAS field of MTL_ECC_Err_Addr_Status register holds the first address where the error is detected. 0b - MTL ECC Error Address Status Over-ride is disabled 1b - MTL ECC Error Address Status Over-ride is enabled

1 MRXEE	MTL Rx FIFO ECC Enable - 1: Enables the ECC feature for MTL Rx FIFO memory. - 0: Disables the ECC feature for MTL Rx FIFO memory. 0b - MTL Rx FIFO ECC is disabled 1b - MTL Rx FIFO ECC is enabled
0 MTXEE	MTL Tx FIFO ECC Enable - 1: Enables the ECC feature for MTL Tx FIFO memory - 0: Disables the ECC feature for MTL Tx FIFO memory 0b - MTL Tx FIFO ECC is disabled 1b - MTL Tx FIFO ECC is enabled

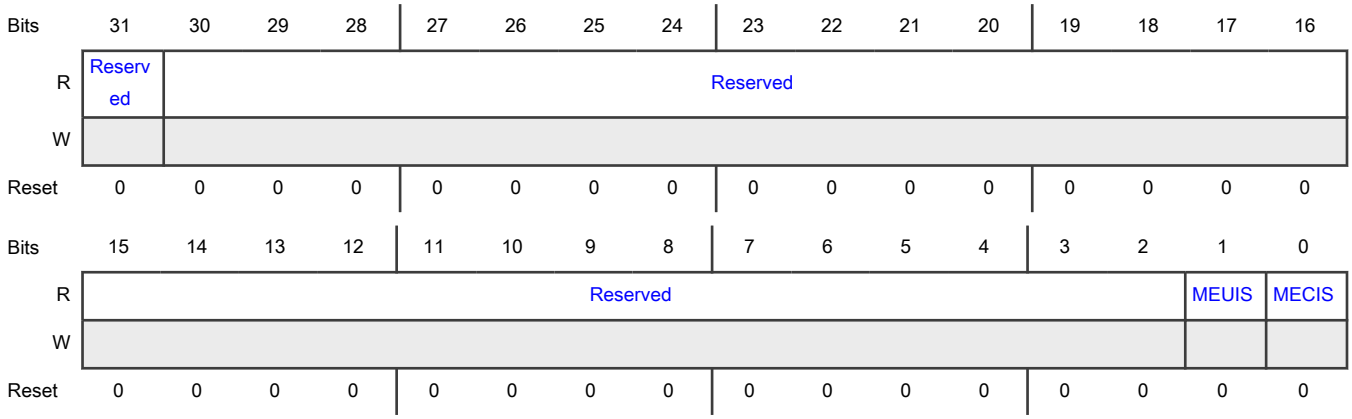
76.17.283 MTL Safety Interrupt Status (MTL_Safety_Interrupt_Status)

Offset

Register	Offset
MTL_Safety_Interrupt_Status	CC4h

Function
The MTL_Safety_Interrupt_Status registers provides Safety interrupt status.

Diagram



Fields

Field	Function
31 —	Reserved 0b - MAC Safety Uncorrectable Interrupt Status not detected 1b - MAC Safety Uncorrectable Interrupt Status detected
30-2 —	Reserved
1 MEUIS	MTL ECC Uncorrectable error Interrupt Status This bit indicates that an uncorrectable error interrupt event in the MTL ECC safety feature. To get the exact cause of the interrupt the application should read the MTL_ECC_Interrupt_Status register. 0b - MTL ECC Uncorrectable error Interrupt Status not detected 1b - MTL ECC Uncorrectable error Interrupt Status detected
0 MECIS	MTL ECC Correctable error Interrupt Status This bit indicates that a correctable error interrupt event in the MTL ECC safety feature. To get the exact cause of the interrupt the application should read the MTL_ECC_Interrupt_Status register. 0b - MTL ECC Correctable error Interrupt Status not detected 1b - MTL ECC Correctable error Interrupt Status detected

76.17.284 MTL ECC Interrupt Enable (MTL_ECC_Interrupt_Enable)

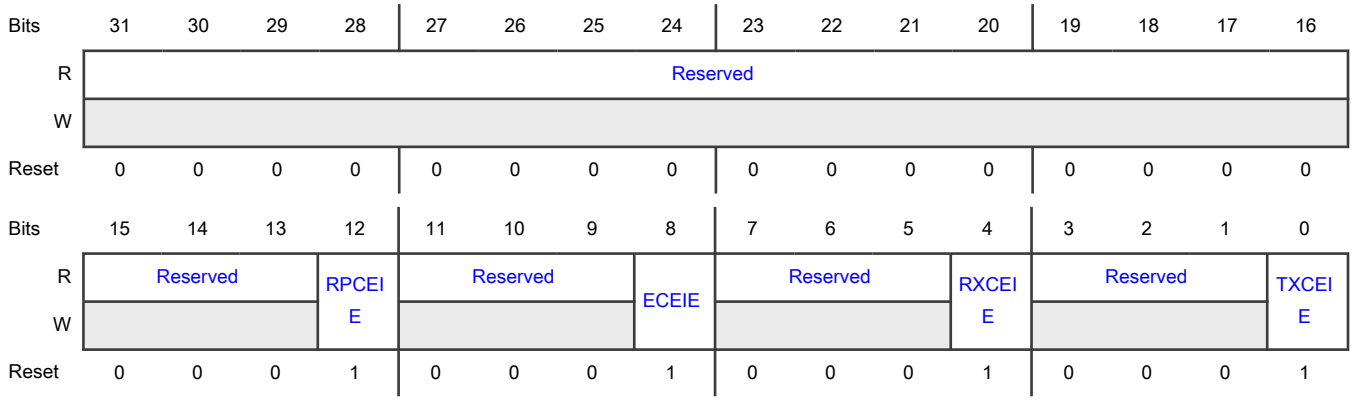
Offset

Register	Offset
MTL_ECC_Interrupt_Enable	CC8h

Function

The MTL_ECC_Interrupt_Enable register provides enable bits for the ECC interrupts.

Diagram



Fields

Field	Function
31-13 —	Reserved
12 RPCEIE	Rx Parser memory Correctable Error Interrupt Enable When set, generates an interrupt when an uncorrectable error is detected at the Rx Parser memory interface. It is indicated in RPCES status bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0b - Rx Parser memory Correctable Error Interrupt is disabled 1b - Rx Parser memory Correctable Error Interrupt is enabled
11-9 —	Reserved
8 ECEIE	EST memory Correctable Error Interrupt Enable When set, generates an interrupt when a correctable error is detected at the MTL EST memory interface. It is indicated in the ECES bit of MTL_ECC_Interrupt_Status register. When reset this event does not generates an interrupt. 0b - EST memory Correctable Error Interrupt is disabled 1b - EST memory Correctable Error Interrupt is enabled

RXUES	When set, indicates that an uncorrectable error is detected at the MTL Rx memory interface. 0b - MTL Rx memory Uncorrectable Error Status not detected 1b - MTL Rx memory Uncorrectable Error Status detected
5 RXAMS	MTL Rx memory Address Mismatch Status This bit when set indicates that address mismatch is found for address bus of the MTL Rx memory. 0b - MTL Rx memory Address Mismatch Status not detected 1b - MTL Rx memory Address Mismatch Status detected
4 RXCES	MTL Rx memory Correctable Error Status This bit when set indicates that correctable error is detected at the MTL Rx memory. 0b - MTL Rx memory correctable Error Status not detected 1b - MTL Rx memory correctable Error Status detected
3 —	Reserved
2 TXUES	MTL Tx memory Uncorrectable Error Status When set, indicates that an uncorrectable error is detected at the MTL TX memory interface. 0b - MTL Tx memory Uncorrectable Error Status not detected 1b - MTL Tx memory Uncorrectable Error Status detected
1 TXAMS	MTL Tx memory Address Mismatch Status This bit when set indicates that address mismatch is found for address bus of the MTL Tx memory. 0b - MTL Tx memory Address Mismatch Status not detected 1b - MTL Tx memory Address Mismatch Status detected
0 TXCES	MTL Tx memory Correctable Error Status This bit when set indicates that a correctable error is detected at the MTL Tx memory. 0b - MTL Tx memory Correctable Error Status not detected 1b - MTL Tx memory Correctable Error Status detected

76.17.286 MTL ECC Error Status (MTL_ECC_Err_Sts_Rctl)

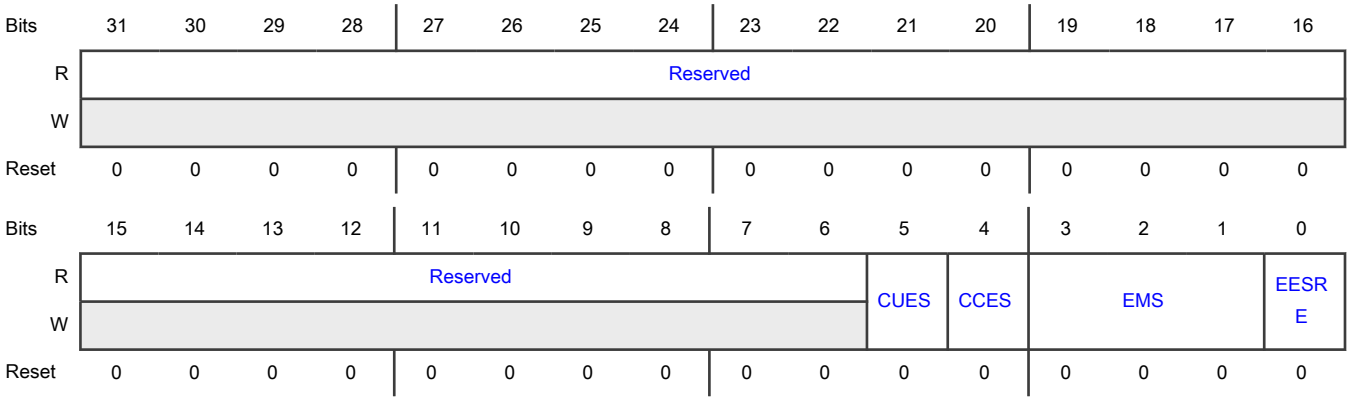
Offset

Register	Offset
MTL_ECC_Err_Sts_Rctl	CD0h

Function

The MTL_ECC_Err_Sts_Rctl register establishes the control for ECC Error status capture.

Diagram



Fields

Field	Function
31-6 —	Reserved
5 CUES	Clear Uncorrectable Error Status When this bit is set along with EESRE bit of this register, based on the EMS field of this register, the respective memory's uncorrectable error address and uncorrectable error count values are cleared upon reading. Hardware resets this bit when all the error status values are cleared. 0b - Clear Uncorrectable Error Status not detected 1b - Clear Uncorrectable Error Status detected
4 CCES	Clear Correctable Error Status When this bit is set along with EESRE bit of this register, based on the EMS field of this register, the respective memory's correctable error address and correctable error count values are cleared upon reading. Hardware resets this bit when all the error status values are cleared. 0b - Clear Correctable Error Status not detected 1b - Clear Correctable Error Status detected
3-1 EMS	MTL ECC Memory Selection When EESRE bit of this register is set, this field indicates which memory's error status value to be read. The memory selection encoding is as described. 000b - MTL Tx memory 001b - MTL Rx memory 010b - MTL EST memory 011b - MTL Rx Parser memory

0 EDPP	Enable Data path Parity Protection When set to 1, enables the parity protection for EQOS datapath by generating and checking the parity on EQOS datapath. When set to 0, disables the parity protection for EQOS datapath. 0b - Data path Parity Protection is disabled 1b - Data path Parity Protection is enabled

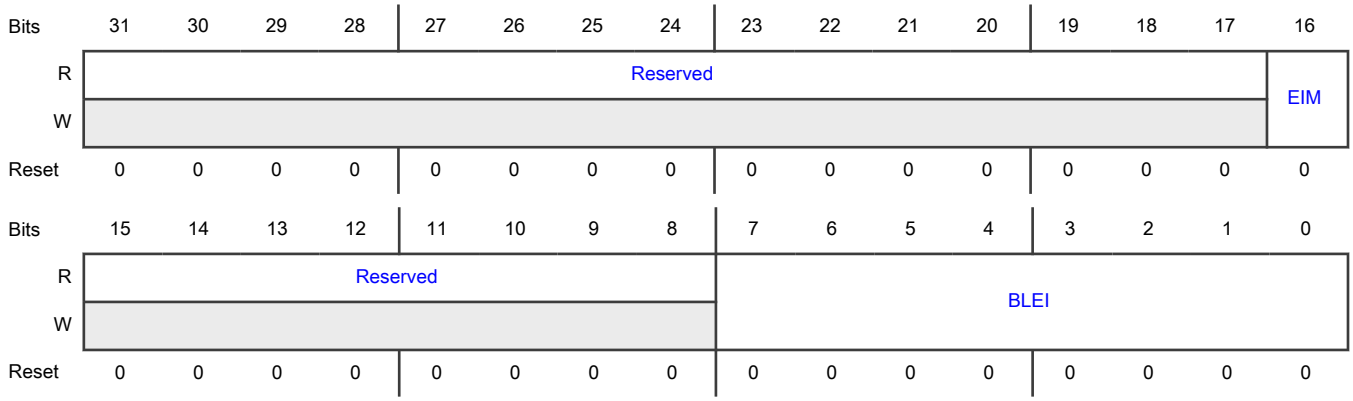
76.17.290 MTL DPP ECC Error Injection Channel (MTL_DPP_ECC_EIC)

Offset

Register	Offset
MTL_DPP_ECC_EIC	CE4h

Function
The MTL_DPP_ECC_EIC establishes the operating mode of ECC/DPP error injection.

Diagram



Fields

Field	Function
31-17 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
16 EIM	Error Injection Mode When it set to 0, indicate error injection on data; When it set to 1, indicate error injection on ECC/Parity bits(need to check the address error injection mode is disabled).
15-8 —	Reserved
7-0 BLEI	Bit Location of error injection This field indicates the bit location of DPP/ECC error injection, determination of error in Parity/ECC bits or Data (being protected) depends on the Error Injection Mode(EIM field). Depending on the interface being used for error injection not all bits of this field are valid. Example, for error injection on a 64 bit data interface this field should be programmed to a value between 63 and 0. In case of 2-bit error injection bit 0 is always included in error injection and this field should represent the second bit selection for error injection.If the second bit is programed at bit 0 when 2-bit error injection is enabled, DUT only insert 1-bit error at bit 0.

76.17.291 MTL Tx Queue 0 Operation Mode (MTL_TxQ0_Operation_Mode)

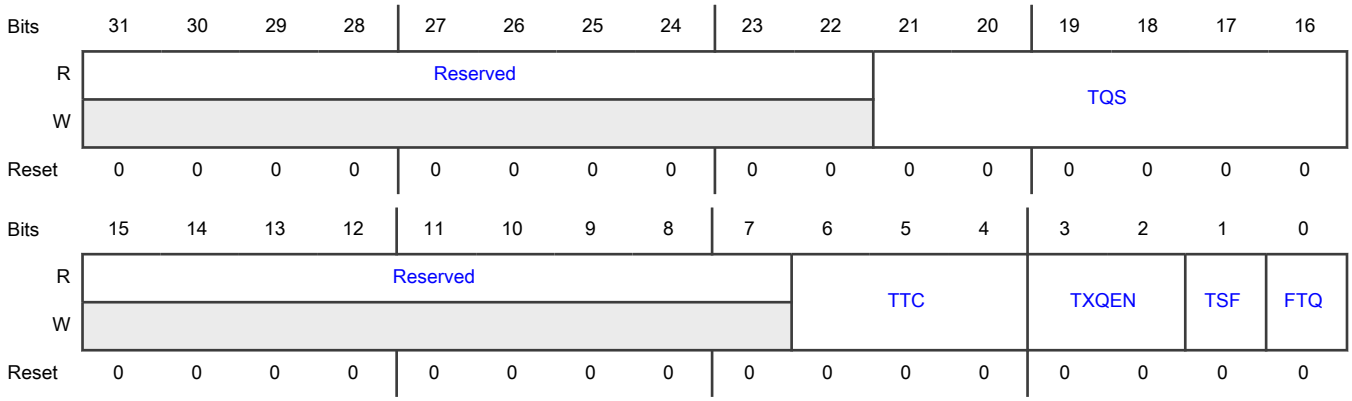
Offset

Register	Offset
MTL_TxQ0_Operation_Mode	D00h

Function

The Queue 0 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Diagram



Fields

Field	Function
31-22 —	Reserved
21-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. So, program TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000b - 32 001b - 64 010b - 96 011b - 128 100b - 192 101b - 256 110b - 384 111b - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Reserved - 2'b10: Enabled - 2'b11: Reserved This field is Read Only in Single Queue configurations and Read Write in Multiple Queue configurations. Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00b - Not enabled 01b - Enable in AV mode (Reserved in non-AV) 10b - Enabled 11b - Reserved
1 TSF	Transmit Store and Forward

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0b - Transmit Store and Forward is disabled 1b - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (CLK_TX_I) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Flush Transmit Queue is disabled 1b - Flush Transmit Queue is enabled

76.17.292 MTL Tx Queue 0 Underflow (MTL_TxQ0_Underflow)

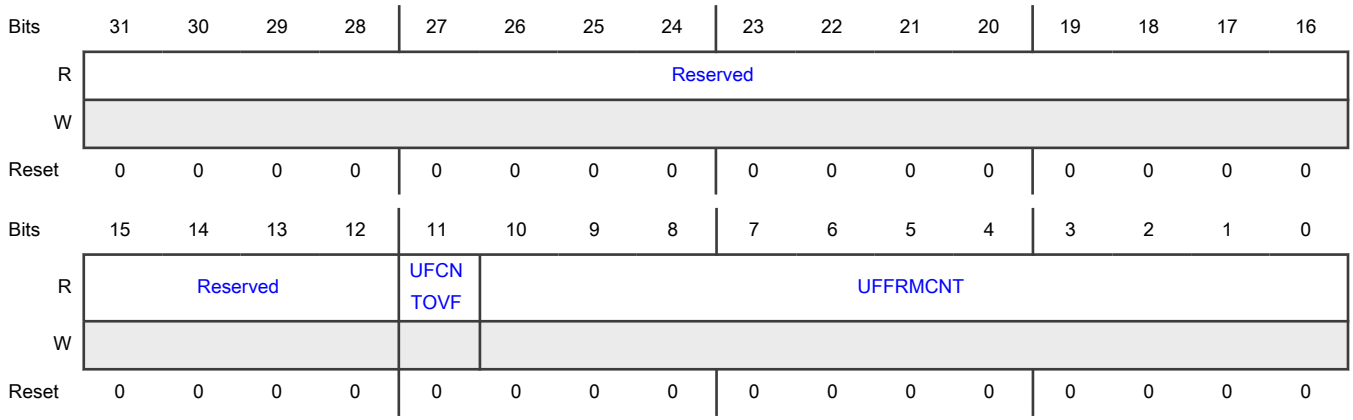
Offset

Register	Offset
MTL_TxQ0_Underflow	D04h

Function

The Queue 0 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Diagram



Fields

Field	Function
31-12 —	Reserved
11 UFCNTOVF	Overflow Bit for Underflow Packet Counter This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Overflow not detected for Underflow Packet Counter 1b - Overflow detected for Underflow Packet Counter
10-0 UFFRMCNT	Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

76.17.293 MTL Tx Queue 0 Debug (MTL_TxQ0_Debug)

Offset

Register	Offset
MTL_TxQ0_Debug	D08h

Function
The Queue 0 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Diagram

Fields

Field	Function
31-23 —	Reserved
22-20 STXSTSF	Number of Status Words in Tx Status FIFO of Queue This field indicates the current number of status in the Tx Status FIFO of this queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of status words in Tx Status FIFO.
19 —	Reserved
18-16 PTXQ	Number of Packets in the Transmit Queue This field indicates the current number of packets in the Tx Queue. When the DTXSTS bit of MTL_Operation_Mode register is set to 1, this field does not reflect the number of packets in the Transmit queue.
15-6 —	Reserved
5 TXSTSFSTS	MTL Tx Status FIFO Full Status When high, this bit indicates that the MTL Tx Status FIFO is full. Therefore, the MTL cannot accept any more packets for transmission. 0b - MTL Tx Status FIFO Full status is not detected 1b - MTL Tx Status FIFO Full status is detected
4 TXQSTS	MTL Tx Queue Not Empty Status When this bit is high, it indicates that the MTL Tx Queue is not empty and some data is left for transmission. 0b - MTL Tx Queue Not Empty status is not detected 1b - MTL Tx Queue Not Empty status is detected
3 TWCSTS	MTL Tx Queue Write Controller Status When high, this bit indicates that the MTL Tx Queue Write Controller is active, and it is transferring the data to the Tx Queue. 0b - MTL Tx Queue Write Controller status is not detected 1b - MTL Tx Queue Write Controller status is detected
2-1 TRCSTS	MTL Tx Queue Read Controller Status This field indicates the state of the Tx Queue Read Controller: 00b - Idle state 01b - Read state (transferring data to the MAC transmitter)

Table continues on the next page...

Table continued from the previous page...

Field	Function
	10b - Waiting for pending Tx Status from the MAC transmitter 11b - Flushing the Tx queue because of the Packet Abort request from the MAC
0 TXQPAUSED	Transmit Queue in Pause When this bit is high and the Rx flow control is enabled, it indicates that the Tx Queue is in the Pause condition (in the full-duplex only mode) because of the following: - Reception of the PFC packet for the priorities assigned to the Tx Queue when PFC is enabled - Reception of 802.3x Pause packet when PFC is disabled 0b - Transmit Queue in Pause status is not detected 1b - Transmit Queue in Pause status is detected

76.17.294 MTL Tx Queue 0 ETS Staus (MTL_TxQ0_ETS_Status)

Offset

Register	Offset
MTL_TxQ0_ETS_Status	D14h

Function

The Queue 0 ETS Status register provides the average traffic transmitted in Queue 0.

Fields

Field	Function
31-24 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
23-0 ABS	Average Bits per Slot This field contains the average transmitted bits per slot. When the DCB operation is enabled for Queue 0, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

76.17.295 MTL Tx Queue 0 Quantum Weight (MTL_TxQ0_Quantum_Weight)

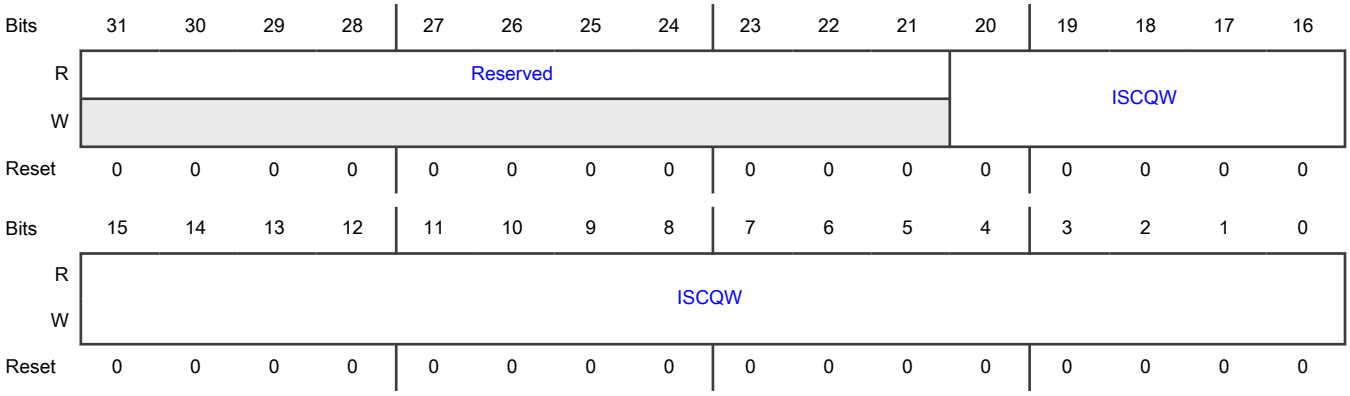
Offset

Register	Offset
MTL_TxQ0_Quantum_Weight	D18h

Function

The Queue 0 Quantum or Weights register contains the quantum value for Deficit Weighted Round Robin (DWRR), weights for the Weighted Round Robin (WRR), and Weighted Fair Queuing (WFQ) for Queue 0.

Diagram



Fields

Field	Function
31-21 —	Reserved
20-0 ISCQW	Quantum or Weights When the DCB operation is enabled with DWRR algorithm for Queue 0 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. When DCB operation is enabled with WFQ algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100%

Table continues on the next page...

Table continued from the previous page...

Field	Function
	bandwidth. Bits[20:14] must be written to zero. The higher the programmed weights lesser the bandwidth allocated for the particular Transmit Queue. This is because the weights are used to compute the packet finish time (weights * packet_size). Lesser the finish time, higher the probability of the packet getting scheduled first and using more bandwidth. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 0 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero.

76.17.296 MTL Queue 0 Interrupt Control Status (MTL_Q0_Interrupt_Control_Status)

Offset

Register	Offset
MTL_Q0_Interrupt_Control_Status	D2Ch

Function
This register contains the interrupt enable and status bits for the queue 0 interrupts.

Diagram

Table continued from the previous page...

Field	Function
	0b - Receive Queue Overflow Interrupt is disabled 1b - Receive Queue Overflow Interrupt is enabled
23-17 —	Reserved
16 RXOVFIS	Receive Queue Overflow Interrupt Status This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Queue Overflow Interrupt Status not detected 1b - Receive Queue Overflow Interrupt Status detected
15-10 —	Reserved
9 ABPSIE	Average Bits Per Slot Interrupt Enable When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0b - Average Bits Per Slot Interrupt is disabled 1b - Average Bits Per Slot Interrupt is enabled
8 TXUIE	Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0b - Transmit Queue Underflow Interrupt Status is disabled 1b - Transmit Queue Underflow Interrupt Status is enabled
7-2 —	Reserved
1 ABPSIS	Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Average Bits Per Slot Interrupt Status not detected 1b - Average Bits Per Slot Interrupt Status detected
0 TXUNFIS	Transmit Queue Underflow Interrupt Status

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Queue Underflow Interrupt Status not detected 1b - Transmit Queue Underflow Interrupt Status detected

76.17.297 MTL Rx Queue 0 Operation Mode (MTL_RxQ0_Operation_Mode)

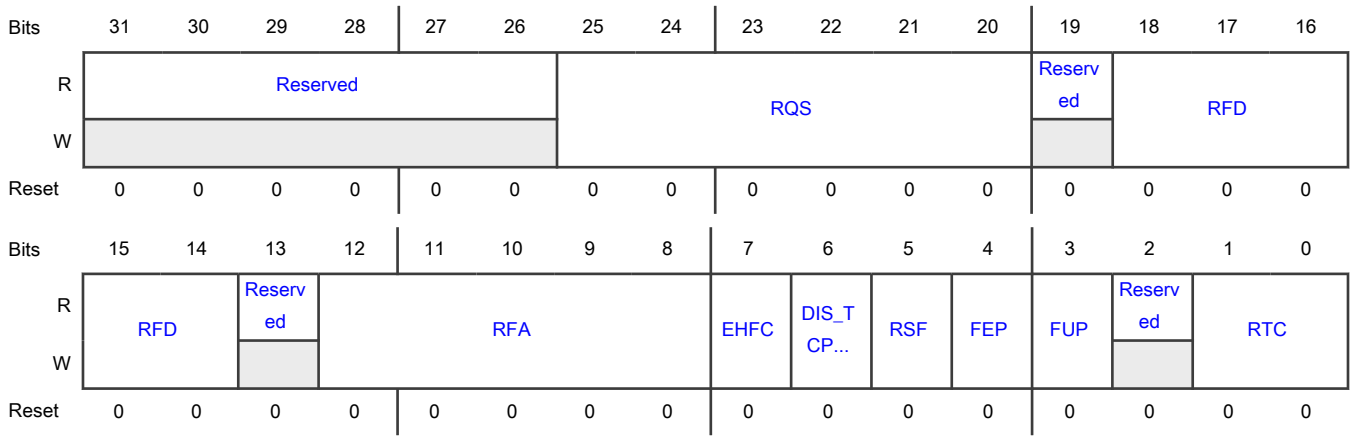
Offset

Register	Offset
MTL_RxQ0_Operation_Mode	D30h

Function

The Queue 0 Receive Operation Mode register establishes the Receive queue operating modes and command. The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Diagram



Fields

Field	Function
31-26 —	Reserved
25-20	Receive Queue Size

Table continues on the next page...

Table continued from the previous page...

Field	Function
RQS	This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. So, program RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19 —	Reserved
18-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 30: Full minus 16 KB, that is, FULL 16 KB - 31: Full minus 16.5 KB, that is, FULL 16.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13 —	Reserved
12-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0b - Hardware Flow Control is disabled 1b - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0b - Dropping of TCP/IP Checksum Error Packets is enabled 1b - Dropping of TCP/IP Checksum Error Packets is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register. 0b - Receive Queue Store and Forward is disabled 1b - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0b - Forward Error Packets is disabled 1b - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0b - Forward Undersized Good Packets is disabled 1b - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00b - 64 01b - 32 10b - 96 11b - 128

76.17.298 MTL Rx Queue 0 Missed Packet Overflow Count (MTL_RxQ0_Missed_Packet_Overflow_Cnt)

Offset

Register	Offset
MTL_RxQ0_Missed_Packet_Overflow_Cnt	D34h

Function

The Queue 0 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Diagram

Field	Function
31-28 —	Reserved
27 MISCNTOVF	Missed Packet Counter Overflow Bit When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Missed Packet Counter overflow not detected 1b - Missed Packet Counter overflow detected
26-16 MISPKTCNT	Missed Packet Counter This field indicates the number of packets missed by the DWC_ether_qos because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-12 —	Reserved
11 OVFCNTOVF	Overflow Counter Overflow Bit When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Overflow Counter overflow not detected 1b - Overflow Counter overflow detected
10-0 OVFPKTCNT	Overflow Packet Counter This field indicates the number of packets discarded by the DWC_ether_qos because of Receive queue overflow. This counter is incremented each time the DWC_ether_qos discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

76.17.299 MTL Rx Queue 0 Debug (MTL_RxQ0_Debug)

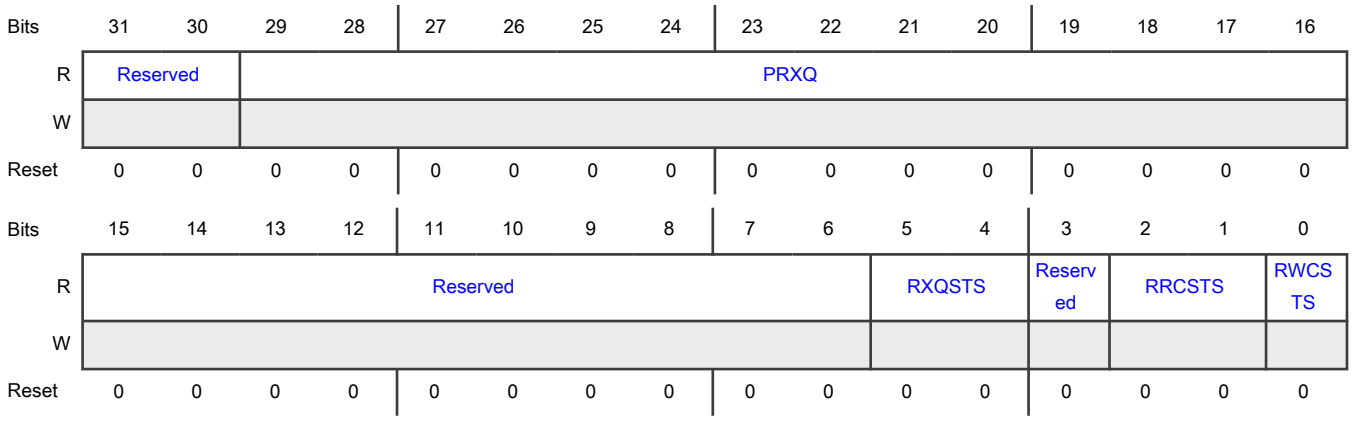
Offset

Register	Offset
MTL_RxQ0_Debug	D38h

Function

The Queue 0 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Diagram



Fields

Field	Function
31-30 —	Reserved
29-16 PRXQ	Number of Packets in Receive Queue This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.
15-6 —	Reserved
5-4 RXQSTS	MTL Rx Queue Fill-Level Status This field gives the status of the fill-level of the Rx Queue: 00b - Rx Queue empty 01b - Rx Queue fill-level below flow-control deactivate threshold 10b - Rx Queue fill-level above flow-control activate threshold 11b - Rx Queue full
3 —	Reserved
2-1 RRCSTS	MTL Rx Queue Read Controller State This field gives the state of the Rx queue Read controller: 00b - Idle state 01b - Reading packet data 10b - Reading packet status (or timestamp) 11b - Flushing the packet data and status
0 RWCSTS	MTL Rx Queue Write Controller Active Status When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0b - MTL Rx Queue Write Controller Active Status not detected 1b - MTL Rx Queue Write Controller Active Status detected

76.17.300 MTL Tx Queue 0 Control (MTL_RxQ0_Control)

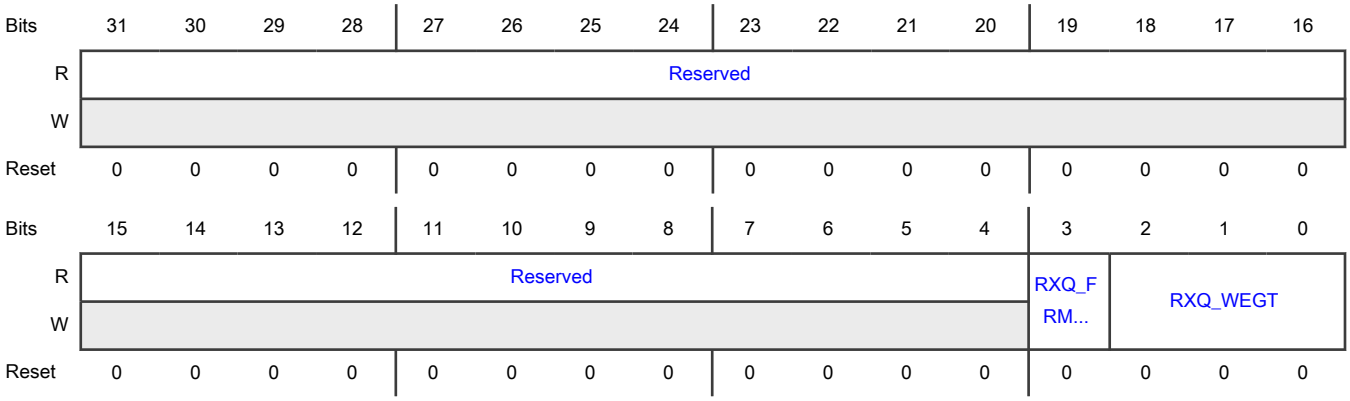
Offset

Register	Offset
MTL_RxQ0_Control	D3Ch

Function

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Diagram



Fields

Field	Function
31-4 —	Reserved
3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the DWC_ether_qos drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the DWC_ether_qos drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0b - Receive Queue Packet Arbitration is disabled 1b - Receive Queue Packet Arbitration is enabled
2-0 RXQ_WEGT	Receive Queue Weight This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, that is, reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

76.17.301 MTL Tx Queue 1 Operation Mode (MTL_TxQ1_Operation_Mode)

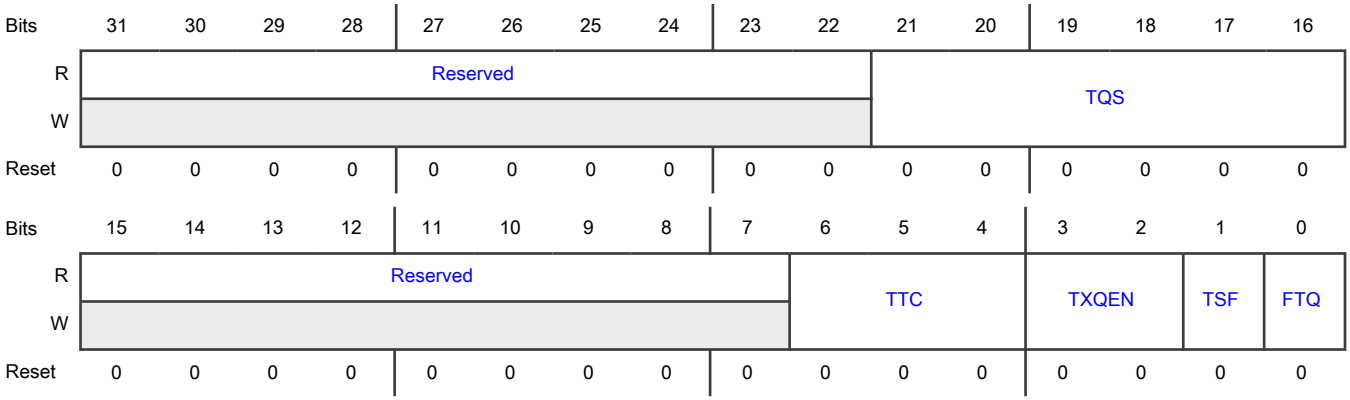
Offset

Register	Offset
MTL_TxQ1_Operation_Mode	D40h

Function

The Queue 1 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Diagram



Fields

Field	Function
31-22 —	Reserved
21-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. So, program TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control

Table continues on the next page...

Table continued from the previous page...

Field	Function
	These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000b - 32 001b - 64 010b - 96 011b - 128 100b - 192 101b - 256 110b - 384 111b - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00b - Not enabled 01b - Enable in AV mode (Reserved in non-AV) 10b - Enabled 11b - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0b - Transmit Store and Forward is disabled 1b - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (CLK_TX_I) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Flush Transmit Queue is disabled 1b - Flush Transmit Queue is enabled

76.17.302 MTL Tx Queue 1 Underflow (MTL_TxQ1_Underflow)

Offset

Register	Offset
MTL_TxQ1_Underflow	D44h

Function

The Queue 1 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Fields

Field	Function
31-24 —	Reserved
23-0 ABS	Average Bits per Slot

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

76.17.306 MTL Tx Queue 1 Quantum Weight (MTL_TxQ1_Quantum_Weight)

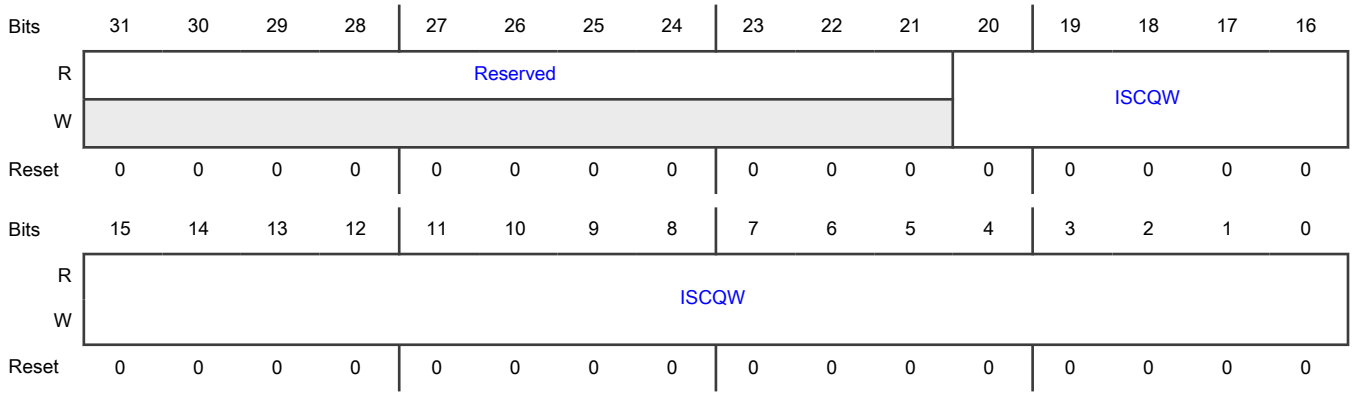
Offset

Register	Offset
MTL_TxQ1_Quantum_Weight	D58h

Function

The Queue 1 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 1.

Diagram



Fields

Field	Function
31-21 —	Reserved
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is

Table continues on the next page...

Table continued from the previous page...

Field	Function
	portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

76.17.307 MTL Tx Queue 1 Sendslope Credit (MTL_TxQ1_SendSlopeCredit)

Offset

Register	Offset
MTL_TxQ1_SendSlopeCredit	D5Ch

76.17.311 MTL Rx Queue 1 Operation Mode (MTL_RxQ1_Operation_Mode)

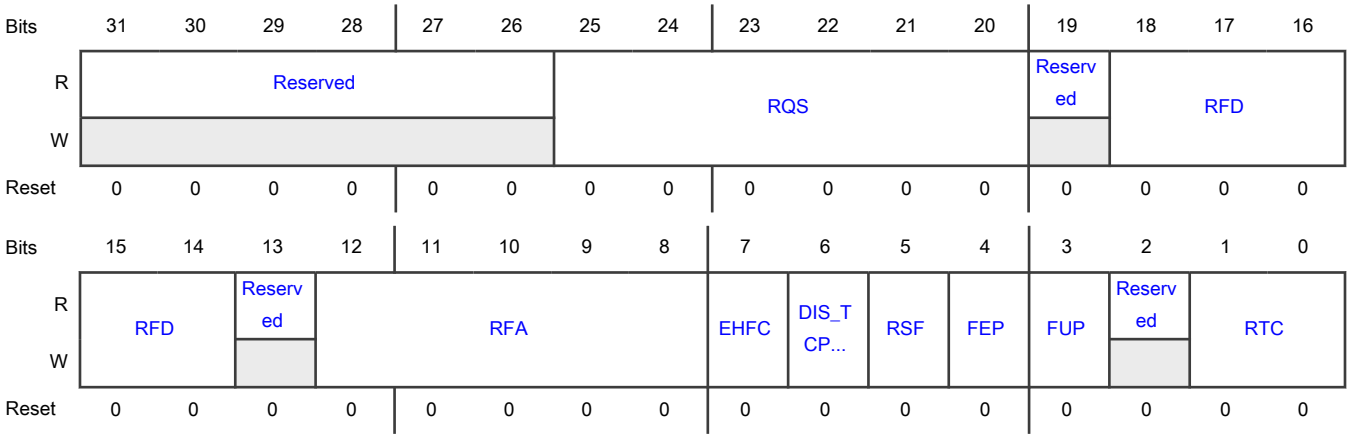
Offset

Register	Offset
MTL_RxQ1_Operation_Mode	D70h

Function

The Queue 1 Receive Operation Mode register establishes the Receive queue operating modes and command. The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Diagram



Fields

Field	Function
31-26 —	Reserved
25-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. So, program RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size

Table continues on the next page...

Table continued from the previous page...

Field	Function
	selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19 —	Reserved
18-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 30: Full minus 16 KB, that is, FULL 16 KB - 31: Full minus 16.5 KB, that is, FULL 16.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13 —	Reserved
12-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0b - Hardware Flow Control is disabled 1b - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0b - Dropping of TCP/IP Checksum Error Packets is enabled 1b - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Receive Queue Store and Forward is disabled 1b - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0b - Forward Error Packets is disabled 1b - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0b - Forward Undersized Good Packets is disabled 1b - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00b - 64 01b - 32 10b - 96 11b - 128

76.17.312 MTL Rx Queue 1 Missed Packet Overflow Counter (MTL_RxQ1_Missed_Packet_Overflow_Cnt)

Offset

Register	Offset
MTL_RxQ1_Missed_Packet_Overflow_Cnt	D74h

Function

The Queue 1 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Diagram

Fields

Field	Function
31-28 —	Reserved
27 MISCNTOVF	Missed Packet Counter Overflow Bit When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Missed Packet Counter overflow not detected 1b - Missed Packet Counter overflow detected
26-16 MISPKTCNT	Missed Packet Counter This field indicates the number of packets missed by the DWC_ether_qos because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-12 —	Reserved
11 OVFCNTOVF	Overflow Counter Overflow Bit When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Overflow Counter overflow not detected 1b - Overflow Counter overflow detected
10-0 OVFPKTCNT	Overflow Packet Counter This field indicates the number of packets discarded by the DWC_ether_qos because of Receive queue overflow. This counter is incremented each time the DWC_ether_qos discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

76.17.313 MTL Rx Queue 1 Debug (MTL_RxQ1_Debug)

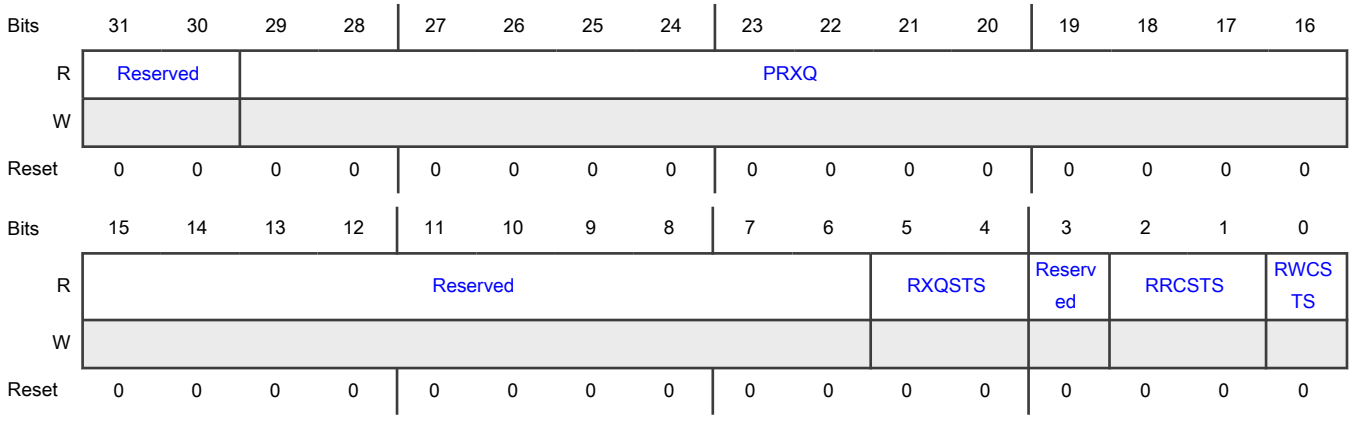
Offset

Register	Offset
MTL_RxQ1_Debug	D78h

Function

The Queue 1 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Diagram



Fields

Field	Function
31-30 —	Reserved
29-16 PRXQ	Number of Packets in Receive Queue This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.
15-6 —	Reserved
5-4 RXQSTS	MTL Rx Queue Fill-Level Status This field gives the status of the fill-level of the Rx Queue: 00b - Rx Queue empty 01b - Rx Queue fill-level below flow-control deactivate threshold 10b - Rx Queue fill-level above flow-control activate threshold 11b - Rx Queue full
3 —	Reserved
2-1 RRCSTS	MTL Rx Queue Read Controller State This field gives the state of the Rx queue Read controller: 00b - Idle state 01b - Reading packet data 10b - Reading packet status (or timestamp) 11b - Flushing the packet data and status
0 RWCSTS	MTL Rx Queue Write Controller Active Status When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0b - MTL Rx Queue Write Controller Active Status not detected 1b - MTL Rx Queue Write Controller Active Status detected

76.17.314 MTL Rx Queue 1 Control (MTL_RxQ1_Control)

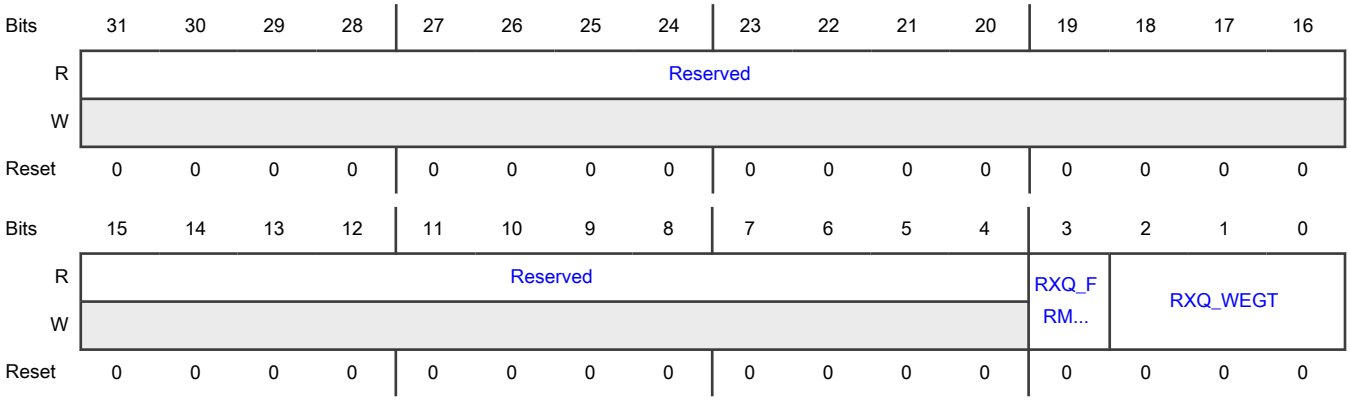
Offset

Register	Offset
MTL_RxQ1_Control	D7Ch

Function

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Diagram



Fields

Field	Function
31-4 —	Reserved
3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the DWC_ether_qos drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the DWC_ether_qos drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0b - Receive Queue Packet Arbitration is disabled 1b - Receive Queue Packet Arbitration is enabled
2-0 RXQ_WEGT	Receive Queue Weight This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, that is, reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

76.17.315 MTL Tx Queue 2 Operation Mode (MTL_TxQ2_Operation_Mode)

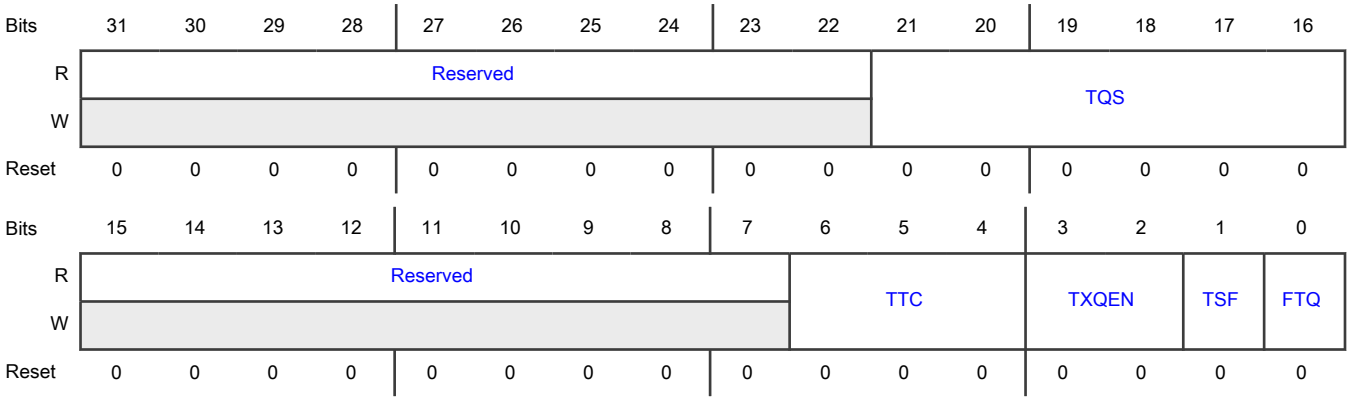
Offset

Register	Offset
MTL_TxQ2_Operation_Mode	D80h

Function

The Queue 2 Transmit Operation Mode register establishes the Transmit queue operating modes and commands.

Diagram



Fields

Field	Function
31-22 —	Reserved
21-16 TQS	Transmit Queue Size This field indicates the size of the allocated Transmit queues in blocks of 256 bytes. The TQS field is read-write only if the number of Tx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. So, program TQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (TQS+1)*256 bytes. When the number of Tx Queues is one, the field is read-only and the configured TX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Tx memory size selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
15-7 —	Reserved
6-4 TTC	Transmit Threshold Control

Table continues on the next page...

Table continued from the previous page...

Field	Function
	These bits control the threshold level of the MTL Tx Queue. The transmission starts when the packet size within the MTL Tx Queue is larger than the threshold. In addition, full packets with length less than the threshold are also transmitted. These bits are used only when the TSF bit is reset. 000b - 32 001b - 64 010b - 96 011b - 128 100b - 192 101b - 256 110b - 384 111b - 512
3-2 TXQEN	Transmit Queue Enable This field is used to enable/disable the transmit queue 0. - 2'b00: Not enabled - 2'b01: Enable in AV mode - 2'b10: Enabled - 2'b11: Reserved Note: In multiple Tx queues configuration, all the queues are disabled by default. Enable the Tx queue by programming this field. 00b - Not enabled 01b - Enable in AV mode (Reserved in non-AV) 10b - Enabled 11b - Reserved
1 TSF	Transmit Store and Forward When this bit is set, the transmission starts when a full packet resides in the MTL Tx queue. When this bit is set, the TTC values specified in Bits[6:4] of this register are ignored. This bit should be changed only when the transmission is stopped. 0b - Transmit Store and Forward is disabled 1b - Transmit Store and Forward is enabled
0 FTQ	Flush Transmit Queue When this bit is set, the Tx queue controller logic is reset to its default values. Therefore, all the data in the Tx queue is lost or flushed. This bit is internally reset when the flushing operation is complete. Until this bit is reset, you should not write to the MTL_TxQ1_Operation_Mode register. The data which is already accepted by the MAC transmitter is not flushed. It is scheduled for transmission and results in underflow and runt packet transmission. Note: The flush operation is complete only when the Tx queue is empty and the application has accepted the pending Tx Status of all transmitted packets. To complete this flush operation, the PHY Tx clock (CLK_TX_I) should be active. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect. 0b - Flush Transmit Queue is disabled 1b - Flush Transmit Queue is enabled

76.17.316 MTL Tx Queue 2 Underflow (MTL_TxQ2_Underflow)

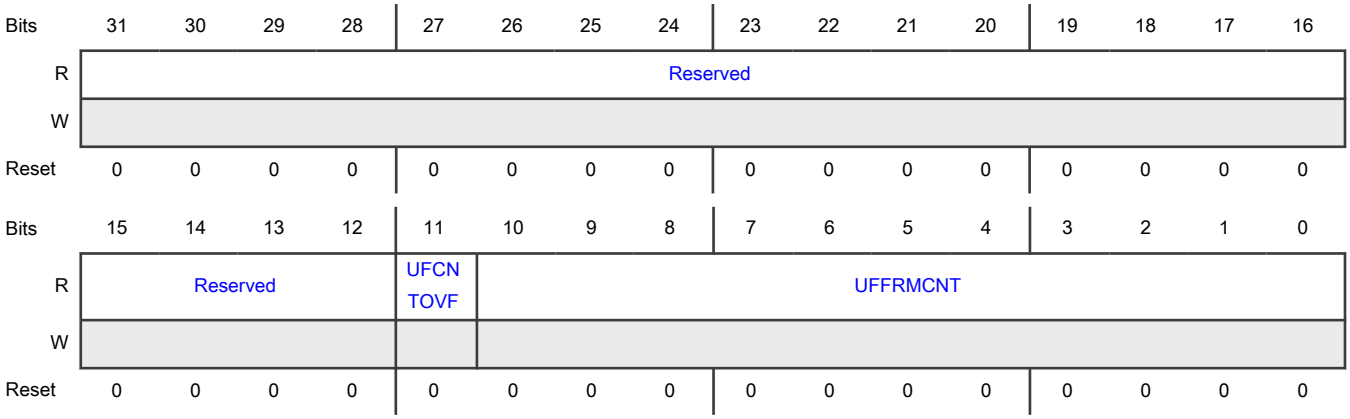
Offset

Register	Offset
MTL_TxQ2_Underflow	D84h

Function

The Queue 2 Underflow Counter register contains the counter for packets aborted because of Transmit queue underflow and packets missed because of Receive queue packet flush

Diagram



Fields

Field	Function
31-12 —	Reserved
11 UFCNTOVF	Overflow Bit for Underflow Packet Counter This bit is set every time the Tx queue Underflow Packet Counter field overflows, that is, it has crossed the maximum count. In such a scenario, the overflow packet counter is reset to all-zeros and this bit indicates that the rollover happened. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Overflow not detected for Underflow Packet Counter 1b - Overflow detected for Underflow Packet Counter
10-0 UFFRMCNT	Underflow Packet Counter This field indicates the number of packets aborted by the controller because of Tx Queue Underflow. This counter is incremented each time the MAC aborts outgoing packet because of underflow. The counter is cleared when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

76.17.317 MTL Tx Queue 2 Debug (MTL_TxQ2_Debug)

Offset

Register	Offset
MTL_TxQ2_Debug	D88h

Function

The Queue 2 Transmit Debug register gives the debug status of various blocks related to the Transmit queue.

Fields

Field	Function
31-24 —	Reserved
23-0 ABS	Average Bits per Slot

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field contains the average transmitted bits per slot. If AV operation is enabled, this field is computed over number of slots, programmed in the SLC field of MTL_TxQ(#i)_ETS_CONTROL register. The maximum value of this field is 0x6_4000 in 100 Mbps, 0x3E_8000 in 1000 Mbps and 9C_4000 in 2500 Mbps mode respectively. When the DCB operation is enabled for Queue, this field is computed over every 10 million bit times slot (4 ms in 2500 Mbps; 10 ms in 1000 Mbps; 100 ms in 100 Mbps). The maximum value is 0x989680.

76.17.320 MTL Tx Queue 2 Quantum Weight (MTL_TxQ2_Quantum_Weight)

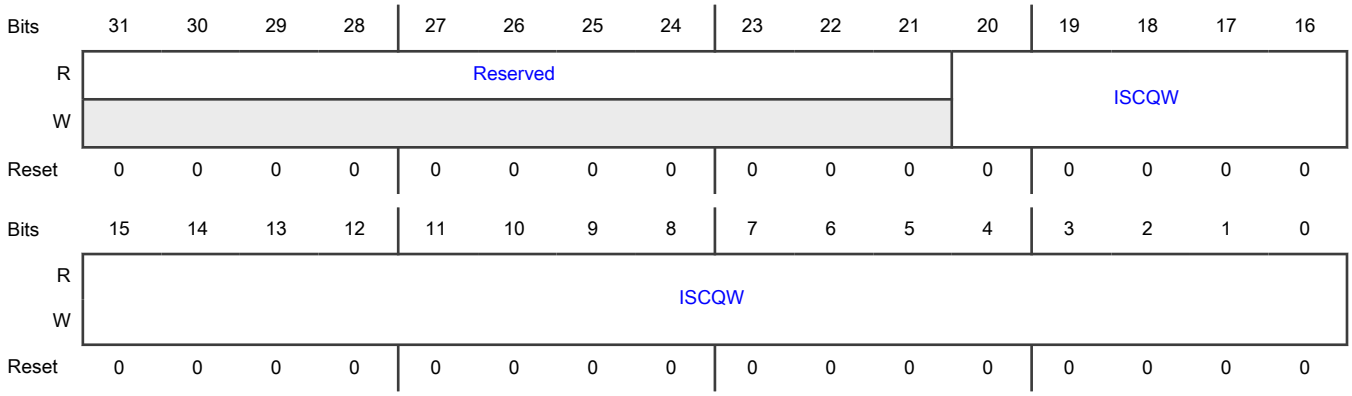
Offset

Register	Offset
MTL_TxQ2_Quantum_Weight	D98h

Function

The Queue 2 idleSlopeCredit, Quantum or Weights register provides the average traffic transmitted in Queue 2.

Diagram



Fields

Field	Function
31-21 —	Reserved
20-0 ISCQW	idleSlopeCredit, Quantum or Weights - idleSlopeCredit When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps; 3.2 ns for 2500 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is

Table continues on the next page...

Table continued from the previous page...

Field	Function
	portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. Bits[20:14] must be written to zero. - Quantum When the DCB operation is enabled with DWRR algorithm for Queue 1 traffic, this field contains the quantum value in bytes to be added to credit during every queue scanning cycle. The maximum value is 0x1312D0 bytes. - Weights When DCB operation is enabled with WFQ algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x3FFF where weight of 0 indicates 100% bandwidth. Bits[20:14] must be written to zero. When DCB operation or generic queuing operation is enabled with WRR algorithm for Queue 1 traffic, this field contains the weight for this queue. The maximum value is 0x64. Bits [20:7] must be written to zero. - Note 1: In multiple Queue configuration this field in respective per queue register must be programmed to some non-zero value when multiple queues are enabled or single queue other than Q0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is MTL_Operation_Mode register. - Note 2: For WFQ algorithm, higher the programmed weights lesser the bandwidth allocated for that Transmit Queue. The finish time is not a function of particular packet alone but it is as per the formula: (previous_finish_time of particular Transmit Queue + (weights*packet_size)) - Note 3: The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

76.17.321 MTL Tx Queue 2 SendSlope Credit (MTL_TxQ2_SendSlopeCredit)

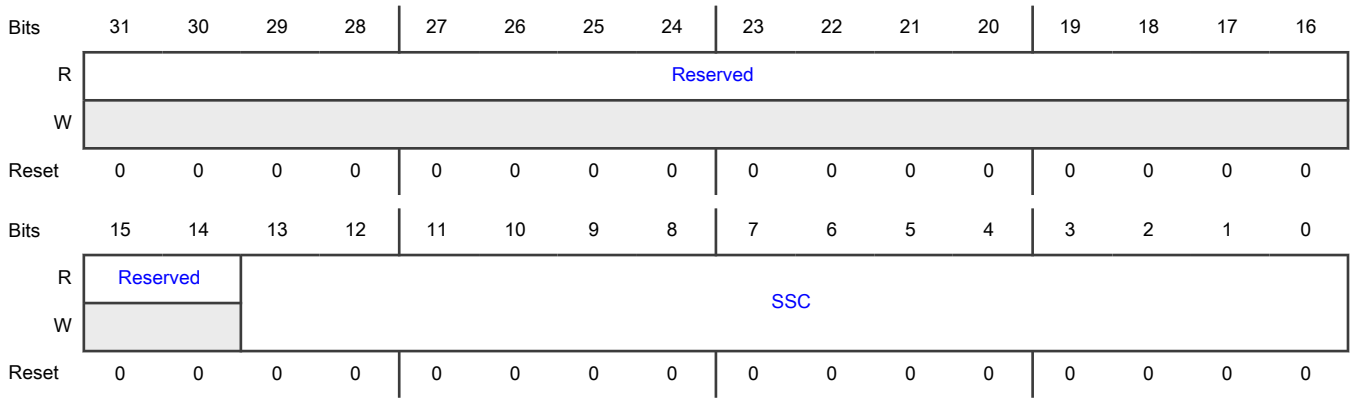
Offset

Register	Offset
MTL_TxQ2_SendSlopeCredit	D9Ch

Function

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

Diagram



Fields

Field	Function
31-14 —	Reserved
13-0 SSC	sendSlopeCredit Value When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for Queue 1. This is the rate of change of credit in bits per cycle (40 ns, 8 ns and 3.2 ns for 100 Mbps, 1000 Mbps and 2500 Mbps respectively) when the credit is decreasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000/2500 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when Channel 1 is selected for transmission.

76.17.322 MTL Tx Queue 2 Hi Credit (MTL_TxQ2_HiCredit)

Offset

Fields

Field	Function
31-29 —	Reserved
28-0 LC	loCredit Value When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1,024. The maximum value to be programmed is corresponds to twice the maxFrameSize transmitted from this queue. If the maxFrameSize is 8192 bytes, then (8192*2) * 8 * 1024 = 134,217,728

Table continues on the next page...

Table continued from the previous page...

Field	Function
	or 0x0800_0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800_0000.

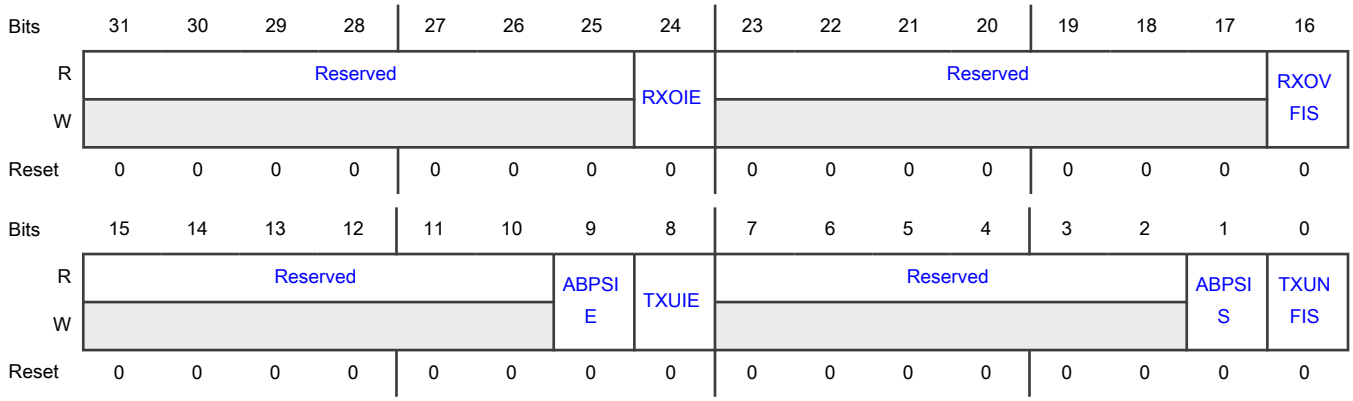
76.17.324 MTL Queue 2 Interrupt Control Status (MTL_Q2_Interrupt_Control_Status)

Offset

Register	Offset
MTL_Q2_Interrupt_Control_Status	DACh

Function
This register contains the interrupt enable and status bits for the queue 2 interrupts.

Diagram



Fields

Field	Function
31-25 —	Reserved
24 RXOIE	Receive Queue Overflow Interrupt Enable When this bit is set, the Receive Queue Overflow interrupt is enabled. When this bit is reset, the Receive Queue Overflow interrupt is disabled. 0b - Receive Queue Overflow Interrupt is disabled 1b - Receive Queue Overflow Interrupt is enabled
23-17	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
16 RXOVFIS	Receive Queue Overflow Interrupt Status This bit indicates that the Receive Queue had an overflow while receiving the packet. If a partial packet is transferred to the application, the overflow status is set in RDES3[21]. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Queue Overflow Interrupt Status not detected 1b - Receive Queue Overflow Interrupt Status detected
15-10 —	Reserved
9 ABPSIE	Average Bits Per Slot Interrupt Enable When this bit is set, the MAC asserts the sbd_intr_o or mci_intr_o interrupt when the average bits per slot status is updated. When this bit is cleared, the interrupt is not asserted for such an event. 0b - Average Bits Per Slot Interrupt is disabled 1b - Average Bits Per Slot Interrupt is enabled
8 TXUIE	Transmit Queue Underflow Interrupt Enable When this bit is set, the Transmit Queue Underflow interrupt is enabled. When this bit is reset, the Transmit Queue Underflow interrupt is disabled. 0b - Transmit Queue Underflow Interrupt Status is disabled 1b - Transmit Queue Underflow Interrupt Status is enabled
7-2 —	Reserved
1 ABPSIS	Average Bits Per Slot Interrupt Status When set, this bit indicates that the MAC has updated the ABS value. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Average Bits Per Slot Interrupt Status not detected 1b - Average Bits Per Slot Interrupt Status detected
0 TXUNFIS	Transmit Queue Underflow Interrupt Status This bit indicates that the Transmit Queue had an underflow while transmitting the packet. Transmission is suspended and an Underflow Error TDES3[2] is set. This bit is cleared when the application writes 1 to this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Queue Underflow Interrupt Status not detected

Table continued from the previous page...

Field	Function
	1b - Transmit Queue Underflow Interrupt Status detected

76.17.325 MTL Rx Queue 2 Operation Mode (MTL_RxQ2_Operation_Mode)

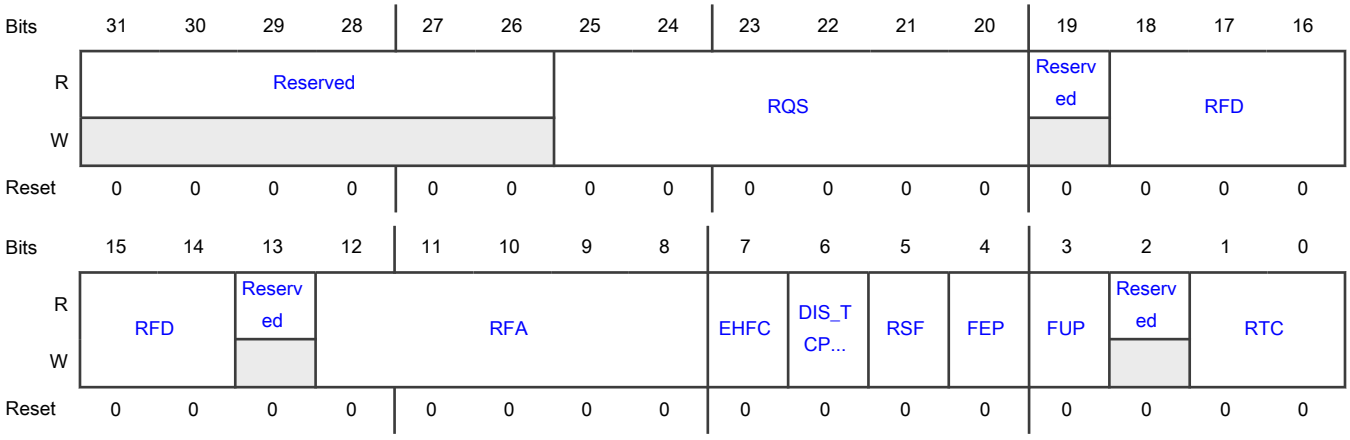
Offset

Register	Offset
MTL_RxQ2_Operation_Mode	DB0h

Function

The Queue 2 Receive Operation Mode register establishes the Receive queue operating modes and command. The RFA and RFD fields are not backward compatible with the RFA and RFD fields of 4.00a release

Diagram



Fields

Field	Function
31-26 —	Reserved
25-20 RQS	Receive Queue Size This field indicates the size of the allocated Receive queues in blocks of 256 bytes. The RQS field is read-write only if the number of Rx Queues more than one, the reset value is 0x0 and indicates size of 256 bytes. This means that value of 0x0 = 256 bytes, 0x1 = 512 bytes and so on. So, program RQS [5:0] = 6'b001111 to allocate queue size of 4096 (4K) bytes. In general, the size of the Queue = (RQS+1)*256 bytes. When the number of Rx Queues is one, the field is read-only and the configured RX FIFO size in blocks of 256 bytes is reflected in the reset value. The width of this field depends on the Rx memory size

Table continues on the next page...

Table continued from the previous page...

Field	Function
	selected in your configuration. For example, if the memory size is 2048, the width of this field is 3 bits: LOG2(2048/256) = LOG2(8) = 3 bits
19 —	Reserved
18-14 RFD	Threshold for Deactivating Flow Control (in half-duplex and full-duplex modes) These bits control the threshold (fill-level of Rx queue) at which the flow control is de-asserted after activation: - 0: Full minus 1 KB, that is, FULL 1 KB - 1: Full minus 1.5 KB, that is, FULL 1.5 KB - 2: Full minus 2 KB, that is, FULL 2 KB - 3: Full minus 2.5 KB, that is, FULL 2.5 KB - ... - 30: Full minus 16 KB, that is, FULL 16 KB - 31: Full minus 16.5 KB, that is, FULL 16.5 KB The de-assertion is effective only after flow control is asserted. Note: The value must be programmed in such a way to make sure that the threshold is a positive number. When the EHFC is set high, these values are applicable only when the Rx queue size determined by the RQS field of this register, is equal to or greater than 4 KB. For a given queue size, the values ranges between 0 and the encoding for FULL minus (QSIZE - 0.5 KB) and all other values are illegal. Here the term FULL and QSIZE refers to the queue size determined by the RQS field of this register. The width of this field depends on RX FIFO size selected during the configuration. Remaining bits are reserved and read only.
13 —	Reserved
12-8 RFA	Threshold for Activating Flow Control (in half-duplex and full-duplex These bits control the threshold (fill-level of Rx queue) at which the flow control is activated: For more information on encoding for this field, see RFD.
7 EHFC	Enable Hardware Flow Control When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled. 0b - Hardware Flow Control is disabled 1b - Hardware Flow Control is enabled
6 DIS_TCP_EF	Disable Dropping of TCP/IP Checksum Error Packets When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC. When this bit is reset, all error packets are dropped if the FEP bit is reset. 0b - Dropping of TCP/IP Checksum Error Packets is enabled 1b - Dropping of TCP/IP Checksum Error Packets is disabled
5 RSF	Receive Queue Store and Forward When this bit is set, the DWC_ether_qos reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Receive Queue Store and Forward is disabled 1b - Receive Queue Store and Forward is enabled
4 FEP	Forward Error Packets When this bit is reset, the Rx queue drops packets with error status (CRC error, GMII_ER, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped. When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet might be forwarded to the application or DMA. 0b - Forward Error Packets is disabled 1b - Forward Error Packets is enabled
3 FUP	Forward Undersized Good Packets When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01. 0b - Forward Undersized Good Packets is disabled 1b - Forward Undersized Good Packets is enabled
2 —	Reserved
1-0 RTC	Receive Queue Threshold Control These bits control the threshold level of the MTL Rx queue (in bytes): The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred. This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1. 00b - 64 01b - 32 10b - 96 11b - 128

76.17.326 MTL Rx Queue 2 Missed Packet Overflow Counter (MTL_RxQ2_Missed_Packet_Overflow_Cnt)

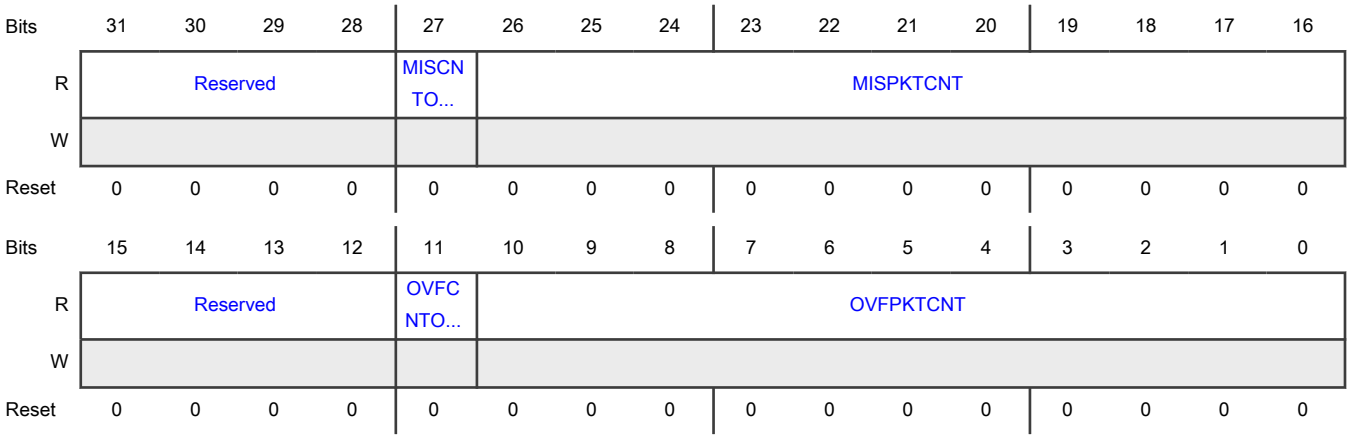
Offset

Register	Offset
MTL_RxQ2_Missed_Packet_Overflow_Cnt	DB4h

Function

The Queue 2 Missed Packet and Overflow Counter register contains the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

Diagram



Fields

Field	Function
31-28 —	Reserved
27 MISCNTOVF	Missed Packet Counter Overflow Bit When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Missed Packet Counter overflow not detected 1b - Missed Packet Counter overflow detected
26-16 MISPKTCNT	Missed Packet Counter This field indicates the number of packets missed by the DWC_ether_qos because the application asserted ari_pkt_flush_i[] for this queue. This counter is reset when this register is read with mci_be_i[0] at 1b1. This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability. Access restriction applies. Clears on read. Self-set to 1 on internal event.

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-12 —	Reserved
11 OVFCNTOVF	Overflow Counter Overflow Bit When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Overflow Counter overflow not detected 1b - Overflow Counter overflow detected
10-0 OVFPKTCNT	Overflow Packet Counter This field indicates the number of packets discarded by the DWC_ether_qos because of Receive queue overflow. This counter is incremented each time the DWC_ether_qos discards an incoming packet because of overflow. This counter is reset when this register is read with mci_be_i[0] at 1'b1. Access restriction applies. Clears on read. Self-set to 1 on internal event.

76.17.327 MTL Rx Queue 2 Debug (MTL_RxQ2_Debug)

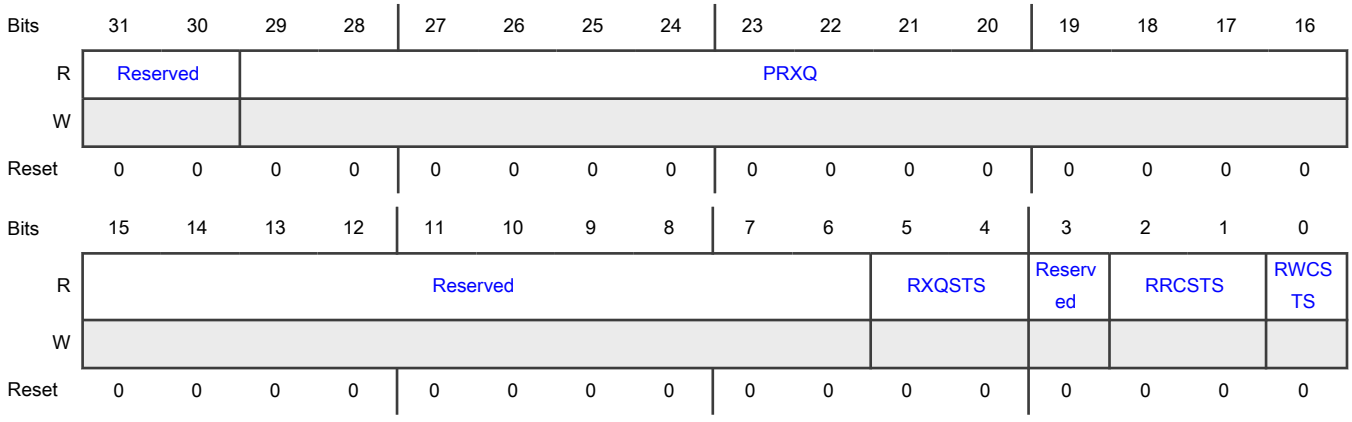
Offset

Register	Offset
MTL_RxQ2_Debug	DB8h

Function

The Queue 2 Receive Debug register gives the debug status of various blocks related to the Receive queue.

Diagram



Fields

Field	Function
31-30 —	Reserved
29-16 PRXQ	Number of Packets in Receive Queue This field indicates the current number of packets in the Rx Queue. The theoretical maximum value for this field is 256KB/16B = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.
15-6 —	Reserved
5-4 RXQSTS	MTL Rx Queue Fill-Level Status This field gives the status of the fill-level of the Rx Queue: 00b - Rx Queue empty 01b - Rx Queue fill-level below flow-control deactivate threshold 10b - Rx Queue fill-level above flow-control activate threshold 11b - Rx Queue full
3 —	Reserved
2-1 RRCSTS	MTL Rx Queue Read Controller State This field gives the state of the Rx queue Read controller: 00b - Idle state 01b - Reading packet data 10b - Reading packet status (or timestamp) 11b - Flushing the packet data and status
0 RWCSTS	MTL Rx Queue Write Controller Active Status When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx Queue. 0b - MTL Rx Queue Write Controller Active Status not detected 1b - MTL Rx Queue Write Controller Active Status detected

76.17.328 MTL Rx Queue 2 Control (MTL_RxQ2_Control)

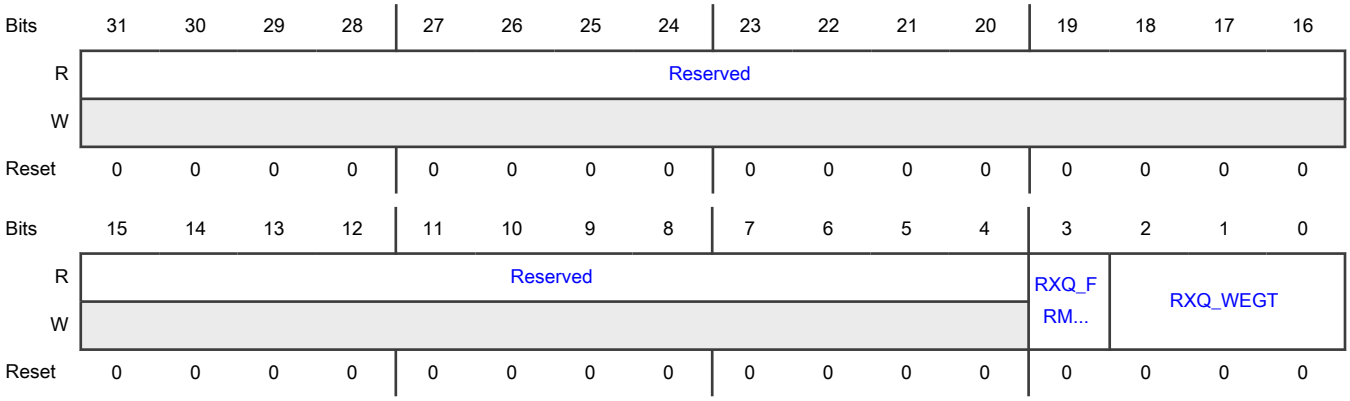
Offset

Register	Offset
MTL_RxQ2_Control	DBCh

Function

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

Diagram



Fields

Field	Function
31-4 —	Reserved
3 RXQ_FRM_ARBIT	Receive Queue Packet Arbitration When this bit is set, the DWC_ether_qos drives the packet data to the ARI interface such that the entire packet data of currently-selected queue is transmitted before switching to other queue. When this bit is reset, the DWC_ether_qos drives the packet data to the ARI interface such that the following amount of data of currently-selected queue is transmitted before switching to other queue: - PBL amount of data (indicated by ari_qN_pbl_i[]) or - Complete data of a packet The status and the timestamp are not a part of the PBL data. Therefore, the DWC_ether_qos drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode). 0b - Receive Queue Packet Arbitration is disabled 1b - Receive Queue Packet Arbitration is enabled
2-0 RXQ_WEGT	Receive Queue Weight This field indicates the weight assigned to the Rx Queue 0. This field needs to be programmed with one value less than the required weight, that is, reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on. The weight is used as the number of continuous PBL or packets requests (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle. Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the MTL_RxQ(#i)_Control registers must be programmed before the MTL_Operation_Mode register.

76.17.329 DMA Mode (DMA_Mode)

Offset

Register	Offset
DMA_Mode	1000h

Function

The Bus Mode register establishes the bus operating modes for the DMA.

Diagram

Field	Function
31-24 —	Reserved
23-22 —	Reserved
21-20 —	Reserved
19 —	Reserved
18 —	Reserved
17-16 INTM	Interrupt Mode This field defines the interrupt mode of DWC_ether_qos. The behavior of the following outputs change depending on the following settings: - sbd_perch_tx_intr_o[] (Transmit Per Channel Interrupt)

Table continues on the next page...

Table continued from the previous page...

Field	Function
	- sbd_perch_rx_intr_o[] (Receive Per Channel Interrupt) - sbd_intr_o (Common Interrupt) It also changes the behavior of the RI/TI bits in the DMA_CH0_Status. - 00: sbd_perch_* are pulse signals for each TX/RX packet transfer completion events (irrespective of whether corresponding interrupts are enabled) for which IOC bits are enabled in descriptor. sbd_intr_o is also asserted when corresponding interrupts are enabled and cleared only when software clears the corresponding RI/TI status bits. - 01: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. - 10: sbd_perch_* are level signals asserted on TX/RX packet transfer completion event when corresponding interrupts are enabled and de-asserted when the software clears the corresponding RI/TI status bits. However, the signal is asserted again if the same event occurred again before it was cleared. The sbd_intr_o is not asserted for these TX/RX packet transfer completion events. - 11: Reserved For more details, see Table "DWC_ether_qos Transfer Complete Interrupt Behavior". 00b - See above description 01b - See above description 10b - See above description 11b - Reserved
15 — 	Reserved
14-12 PR	Priority Ratio These bits control the priority ratio in weighted round-robin arbitration between the Rx DMA and Tx DMA. These bits are valid only when the DA bit is reset. The priority ratio is Rx:Tx or Tx:Rx depending on whether the TXPR bit is reset or set. 000b - The priority ratio is 1:1 001b - The priority ratio is 2:1 010b - The priority ratio is 3:1 011b - The priority ratio is 4:1 100b - The priority ratio is 5:1 101b - The priority ratio is 6:1 110b - The priority ratio is 7:1 111b - The priority ratio is 8:1
11 TXPR	Transmit Priority When set, this bit indicates that the Tx DMA has higher priority than the Rx DMA during arbitration for the system-side bus or Descriptor reads from DCACHE memory when DWC_EQOS_DCEXT is enabled 0b - Transmit Priority is disabled 1b - Transmit Priority is enabled
10	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
9 ARBC	ARBC ARBC is NXP Reserved, This field must be set to "0". - This field is reserved for NXP Internal use, and must always be set to "0" unless instructed by NXP. - Setting this field to "1" might cause unexpected behavior in the IP. 0b - NXP reserved field disabled 1b - NXP reserved field enabled up on NXP request
8 —	Reserved
7-5 —	Reserved
4-2 TAA	Transmit Arbitration Algorithm This field is used to select the arbitration algorithm for the Transmit side when multiple Tx DMAs are selected. 000b - Fixed priority (Channel 0 has the lowest priority and the last channel has the highest priority) 001b - Weighted Strict Priority (WSP) 010b - Weighted Round-Robin (WRR) 011b - Reserved (for 3'b011 to 3'b111)
1 DA	DMA Tx or Rx Arbitration Scheme This bit specifies the arbitration scheme between the Transmit and Receive paths of all channels: - 0: Weighted Round-Robin with Rx:Tx or Tx:Rx The priority between the paths is according to the priority specified in Bits[14:12] and the priority weight is specified in the TXPR bit. - 1: Fixed Priority The Tx path has priority over the Rx path when the TXPR bit is set. Otherwise, the Rx path has priority over the Tx path. 0b - Weighted Round-Robin with Rx:Tx or Tx:Rx 1b - Fixed Priority
0 SWR	Software Reset When this bit is set, the MAC and the DMA controller reset the logic and all internal registers of the DMA, MTL, and MAC. This bit is automatically cleared after the reset operation is complete in all DWC_ether_qos clock domains. Before reprogramming any DWC_ether_qos register, a value of zero should be read in this bit. This bit must be read at least 4 CSR clock cycles after it is written to 1. Note: The reset operation is complete only when all resets in all active clock domains are de-asserted. Therefore, it is essential that all PHY inputs clocks (applicable for the selected PHY interface) are present for software reset completion. The time to complete the software reset operation depends on the frequency of the slowest active clock. Access restriction applies. Setting 1 sets. Self-cleared. Setting 0 has no effect.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Software Reset is disabled 1b - Software Reset is enabled

76.17.330 DMA System Bus Mode (DMA_SysBus_Mode)

Offset

Register	Offset
DMA_SysBus_Mode	1004h

Function

The System Bus mode register controls the behavior of the AHB or AXI master. It mainly controls burst splitting and number of outstanding requests.

76.17.337 DMA Safety Interrupt Status (DMA_Safety_Interrupt_Status)

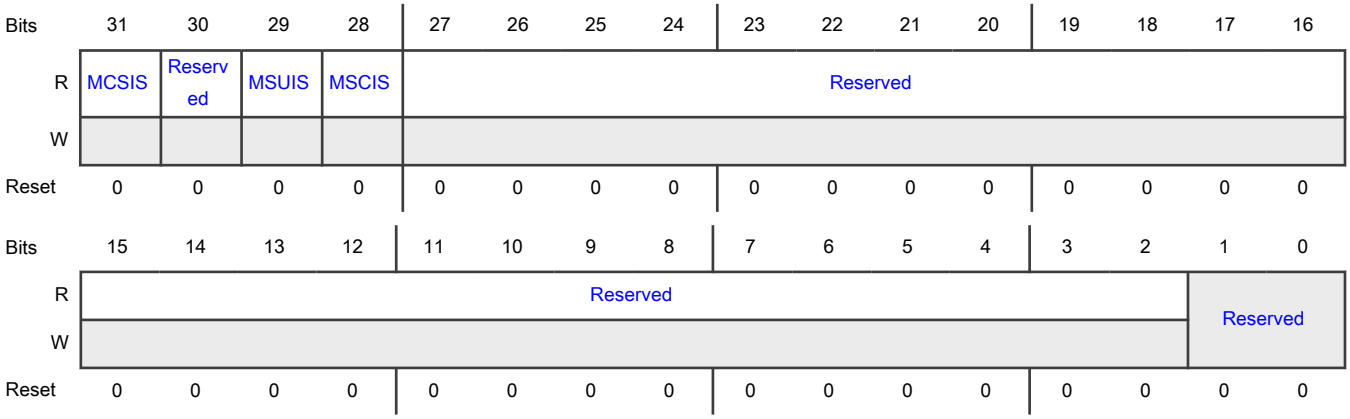
Offset

Register	Offset
DMA_Safety_Interrupt_Status	1080h

Function

This register indicates summary (whether error occured in DMA/MTL/MAC and correctable/uncorrectable) of the Automotive Safety related error interrupts.

Diagram



Fields

Field	Function
31 MCSIS	MAC Safety Uncorrectable Interrupt Status

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Indicates a uncorrectable Safety related Interrupt is set in the MAC module. MAC_DPP_FSM_Interrupt_Status register should be read when this bit is set, to get the cause of the Safety Interrupt in MAC. 0b - MAC Safety Uncorrectable Interrupt Status not detected 1b - MAC Safety Uncorrectable Interrupt Status detected
30 —	Reserved
29 MSUIS	MTL Safety Uncorrectable error Interrupt Status This bit indicates an uncorrectable error interrupt event in MTL. To get exact cause of the interrupt the software should read the MTL_Safety_Interrupt_Status register. 0b - MTL Safety Uncorrectable error Interrupt Status not detected 1b - MTL Safety Uncorrectable error Interrupt Status detected
28 MSCIS	MTL Safety Correctable error Interrupt Status This bit indicates a correctable error interrupt event in MTL. To get exact cause of the interrupt the software should read the MTL_Safety_Interrupt_Status register. 0b - MTL Safety Correctable error Interrupt Status not detected 1b - MTL Safety Correctable error Interrupt Status detected
27-2 —	Reserved
1-0 —	Reserved

76.17.338 DMA Channel 0 Control (DMA_CH0_Control)

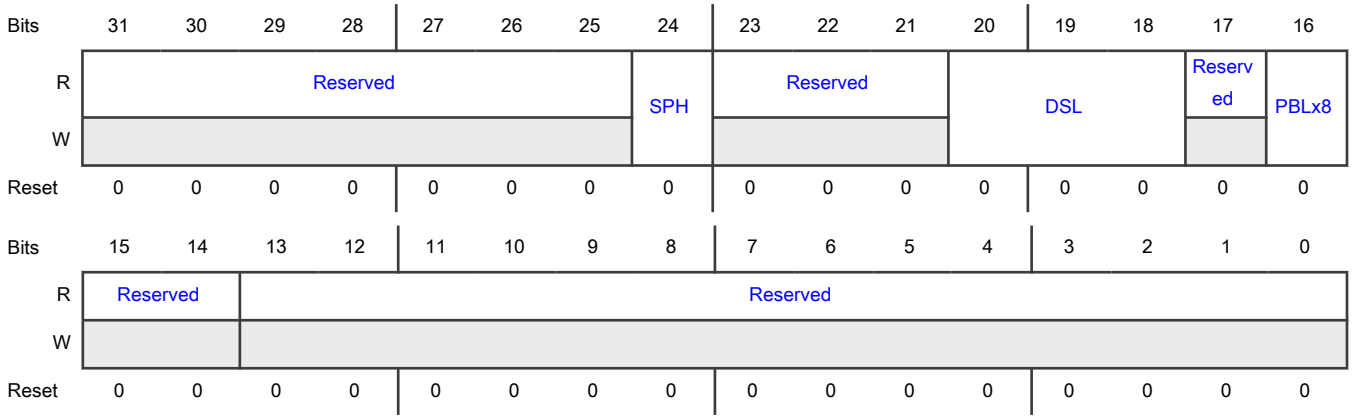
Offset

Register	Offset
DMA_CH0_Control	1100h

Function

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Diagram



Fields

Field	Function
31-25 —	Reserved
24 SPH	Split Headers When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0b - Split Headers feature is disabled 1b - Split Headers feature is enabled
23-21 —	Reserved
20-18 DSL	Descriptor Skip Length This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17 —	Reserved
16 PBLx8	8xPBL mode When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0b - 8xPBL mode is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - 8xPBL mode is enabled
15-14 —	Reserved
13-0 —	Reserved

76.17.339 DMA Channel 0 Tx Control (DMA_CH0_Tx_Control)

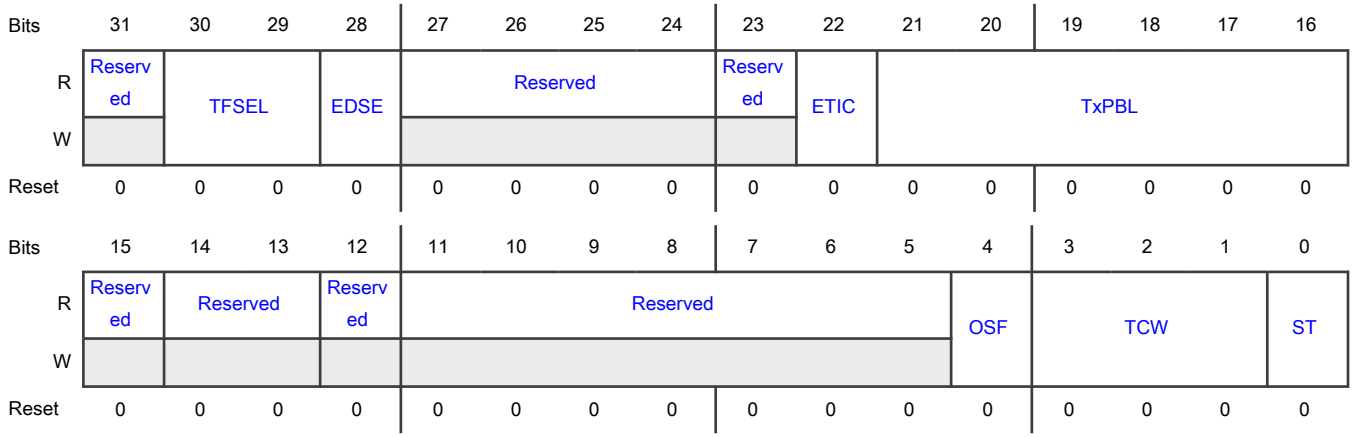
Offset

Register	Offset
DMA_CH0_Tx_Control	1104h

Function

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Diagram



Fields

Field	Function
31 —	Reserved
30-29	TBS Fetch Select

Table continues on the next page...

Table continued from the previous page...

Field	Function
TFSEL	Select bits for one of the four DMA_TBS_CTRL register fields (FTOS,FGSN,FTOV) for the channel Values: - 2'b00: DMA_TBS_CTRL0 - 2'b01: DMA_TBS_CTRL1 - 2'b10: DMA_TBS_CTRL2 - 2'b11: DMA_TBS_CTRL3 (Reserved if DWC_EQOS_NUM_DMA_TX_CH=3)
28 EDSE	Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0b - Enhanced Descriptor is disabled 1b - Enhanced Descriptor is enabled
27-24 —	Reserved
23 —	Reserved
22 ETIC	Early Transmit Interrupt Control When this bit is set, Early Transmit Interrupt (ETI) status is set after completion of transfer of data from buffers of a transmit descriptor in which IOC bit (TDES2[31]) is set. When this bit is reset, ETI is set only after a complete packet is transferred to the MTL TX FIFO memory. 0b - Early Transmit Interrupt is disabled 1b - Early Transmit Interrupt is enabled
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-13 —	Reserved
12 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0b - Operate on Second Packet disabled 1b - Operate on Second Packet enabled
3-1 TCW	Transmit Channel Weight This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0b - Stop Transmission Command 1b - Start Transmission Command

76.17.340 DMA Channel 0 Rx Control (DMA_CH0_Rx_Control)

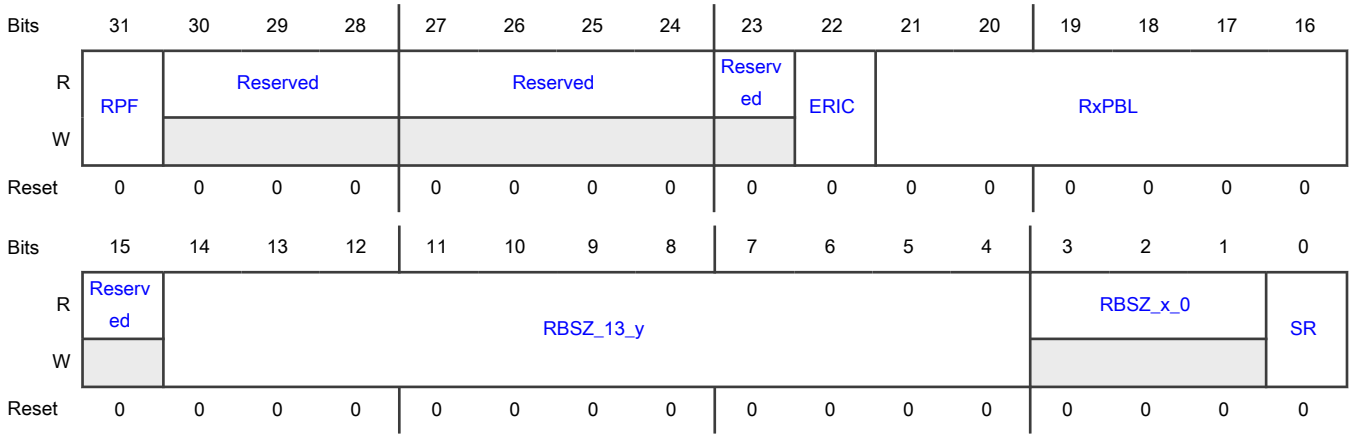
Offset

Register	Offset
DMA_CH0_Rx_Control	1108h

Function

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Diagram



Fields

Field	Function
31 RPF	Rx Packet Flush. - 1: DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, are flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing is done on the Read side of the Rx Queue. - 0: DWC_ether_qos does not flush the packet in the Rx Queue destined to this RxDMA Channel when it is in STOP state. This might cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0b - Rx Packet Flush is disabled 1b - Rx Packet Flush is enabled
30-28 —	Reserved
27-24 —	Reserved
23 —	Reserved
22 ERIC	Early Receive Interrupt Control When this bit is set, Early Receive Interrupt (ERI) status is set after the completion of every burst transfer of data from the Rx DMA to the buffer. When this bit is reset, ERI is set only after a complete buffer is filled up by the RxDMA. 0b - Early Receive Interrupt is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Early Receive Interrupt is enabled
21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0b - Stop Receive 1b - Start Receive

76.17.341 DMA Channel 0 Tx Descriptor List Address (DMA_CH0_TxDesc_List_Address)

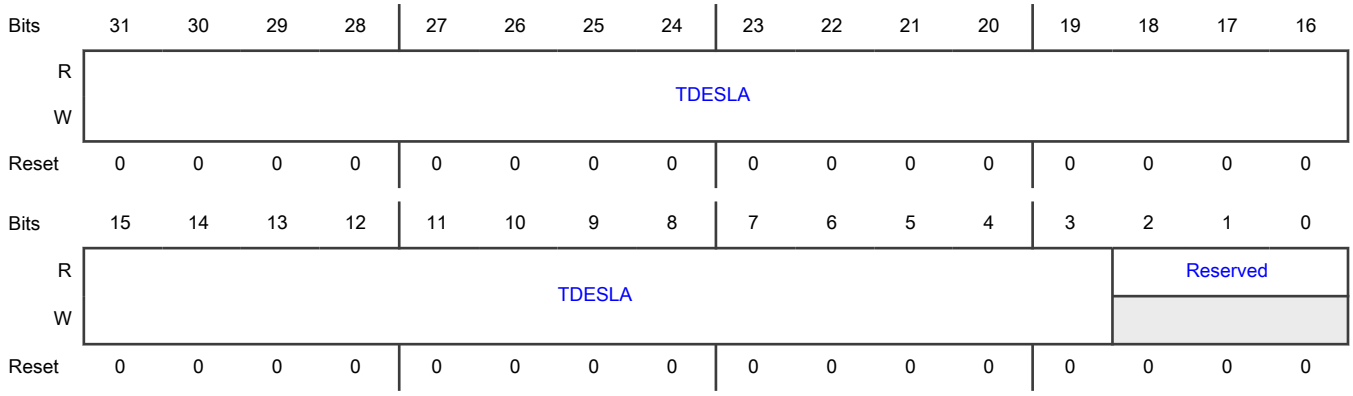
Offset

Register	Offset
DMA_CH0_TxDesc_List_Address	1114h

Function

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low. You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Diagram



Fields

Field	Function
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.342 DMA Channel 0 Rx Descriptor List Address (DMA_CH0_RxDesc_List_Address)

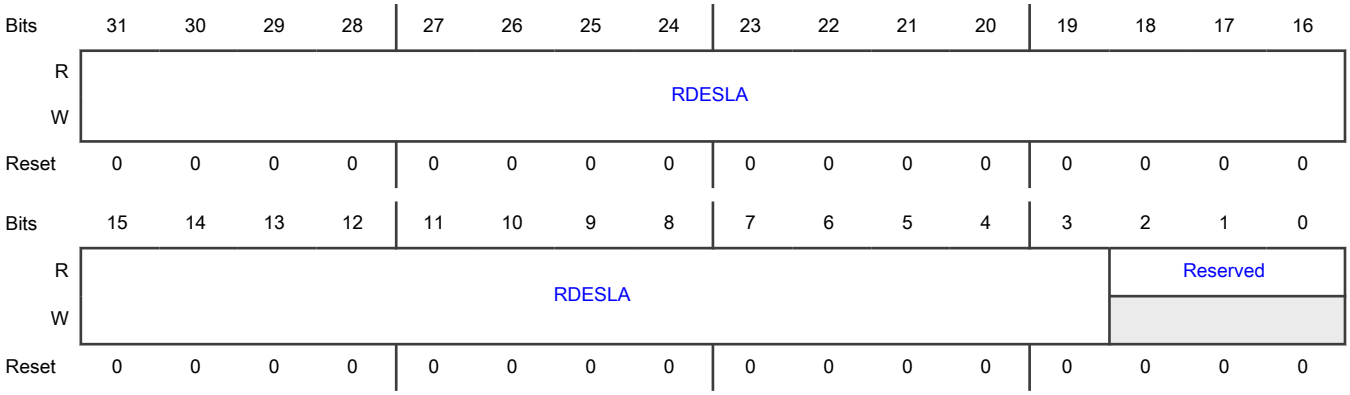
Offset

Register	Offset
DMA_CH0_RxDesc_List_Address	111Ch

Function

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list. This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Diagram



Fields

Field	Function
31-3 RDESLA	Start of Receive List This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration

76.17.344 DMA Channel 0 Rx Descriptor Tail Pointer (DMA_CH0_RxDesc_Tail_Pointer)

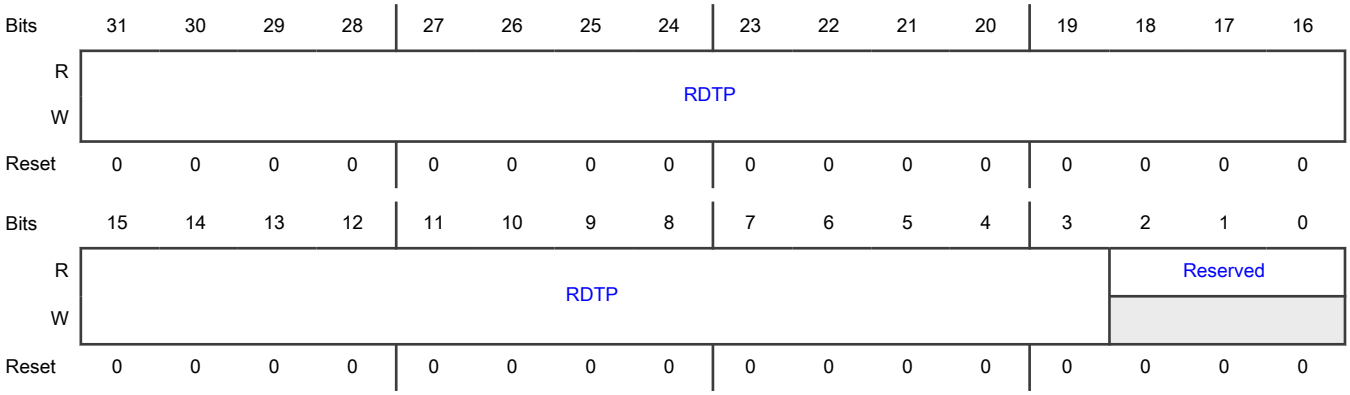
Offset

Register	Offset
DMA_CH0_RxDesc_Tail_Pointer	1128h

Function

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Diagram



Fields

Field	Function
31-3 RDTP	Receive Descriptor Tail Pointer This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.345 DMA Channel 0 Tx Descriptor Ring Length (DMA_CH0_TxDesc_Ring_Length)

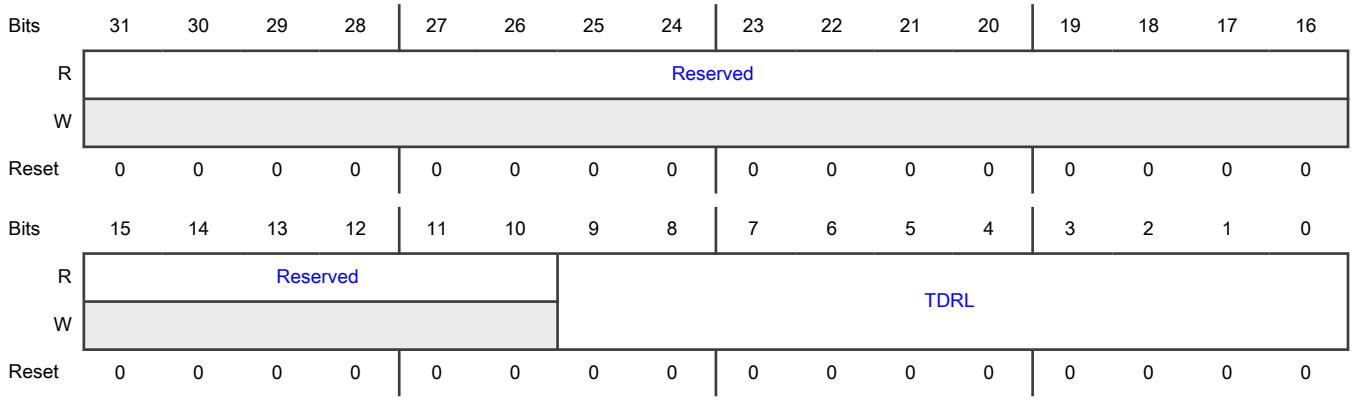
Offset

Register	Offset
DMA_CH0_TxDesc_Ring_Length	112Ch

Function

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Diagram



Fields

Field	Function
31-10 —	Reserved
9-0 TDRL	Transmit Descriptor Ring Length Transmit Descriptor Ring Length This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. NXP recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

76.17.346 DMA Channel 0 Rx Control 2 (DMA_CH0_Rx_Control2)

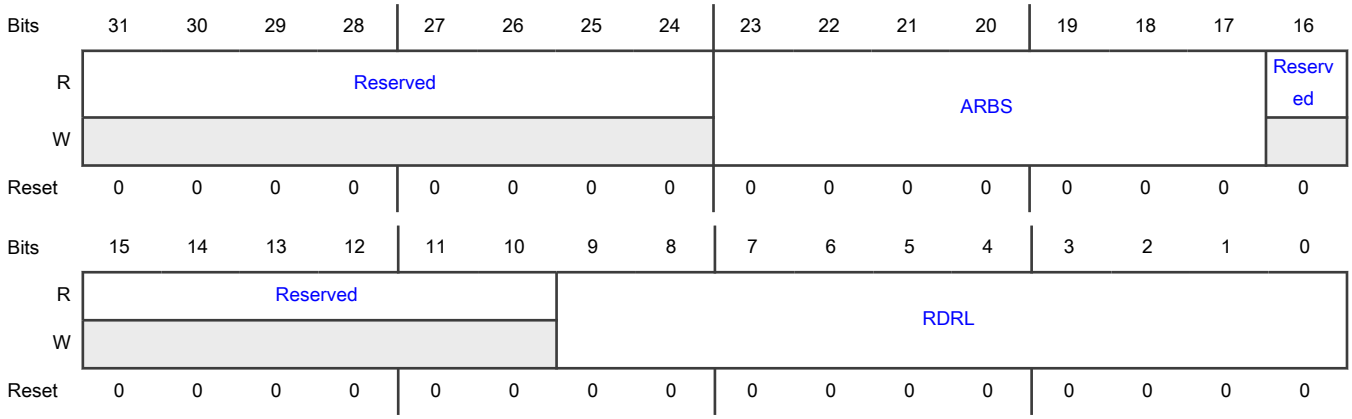
Offset

Register	Offset
DMA_CH0_Rx_Control2	1130h

Function

The Channeli Receive Control register controls the Rx features such as Rx Descriptor Ring Length and Alternate Rx Buffer Size.

Diagram



Fields

Field	Function
31-24 —	Reserved
23-17 ARBS	Alternate Receive Buffer Size Indicates size in bytes for Buffer 1 when ARBS is programmed to a non-zero value (when split header feature is not enabled). When split header feature is enabled, ARBS indicates the buffer size for header data. The maximum alternate buffer is limited to 1020, 1016 or 1008-bytes depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). When ARBS=0, Rx Buffer1 and Rx Buffer2 sizes are based on RBSZ field of DMA_CH(#i)_Rx_Control. Width of ARBS field is 8, 7 or 6-bits depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively)
16-10 —	Reserved
9-0 RDRL	Receive Descriptor Ring Length This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

76.17.347 DMA Channel 0 Interrupt Enable (DMA_CH0_Interrupt_Enable)

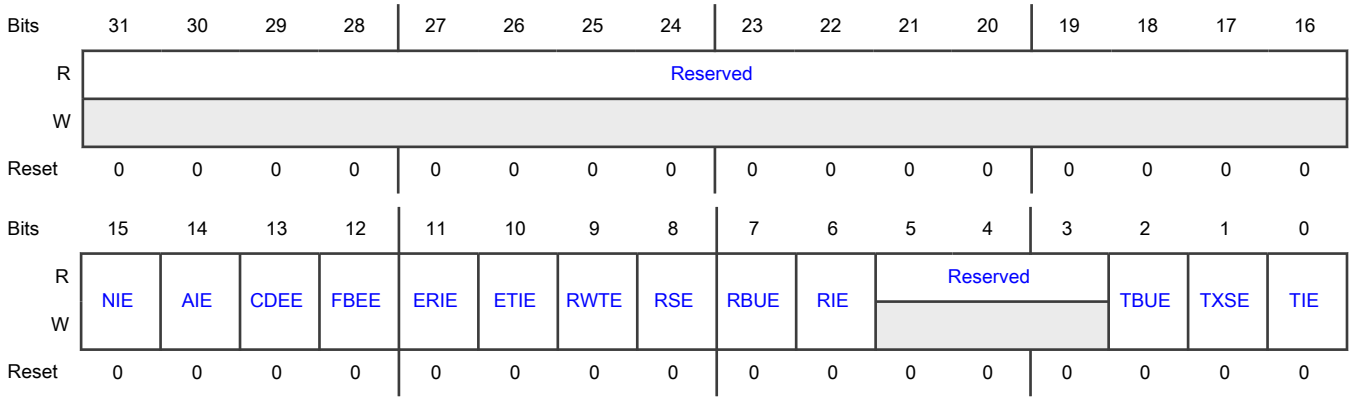
Offset

Register	Offset
DMA_CH0_Interrupt_Enable	1134h

Function

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Diagram



Fields

Field	Function
31-16 —	Reserved
15 NIE	Normal Interrupt Summary Enable When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0b - Normal Interrupt Summary is disabled 1b - Normal Interrupt Summary is enabled
14 AIE	Abnormal Interrupt Summary Enable When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0b - Abnormal Interrupt Summary is disabled 1b - Abnormal Interrupt Summary is enabled
13 CDEE	Context Descriptor Error Enable When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0b - Context Descriptor Error is disabled 1b - Context Descriptor Error is enabled

When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0b - Transmit Buffer Unavailable is disabled 1b - Transmit Buffer Unavailable is enabled
1 TXSE	Transmit Stopped Enable When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0b - Transmit Stopped is disabled 1b - Transmit Stopped is enabled
0 TIE	Transmit Interrupt Enable When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0b - Transmit Interrupt is disabled 1b - Transmit Interrupt is enabled

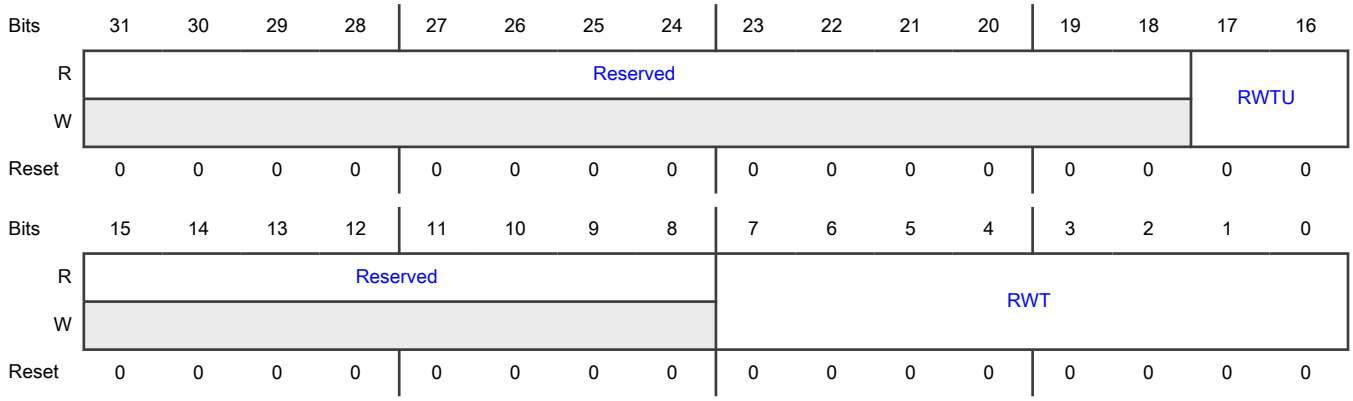
76.17.348 DMA Channel 0 Rx Interrupt Watchdog Timer (DMA_CH0_Rx_Interrupt_Watchdog_Timer)

Offset

Register	Offset
DMA_CH0_Rx_Interrupt_Watchdog_Timer	1138h

Function
The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Diagram



Fields

Field	Function
31-18 —	Reserved
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

76.17.349 DMA Channel 0 Slot Function Control Status (DMA_CH0_Slot_Function_Control_Status)

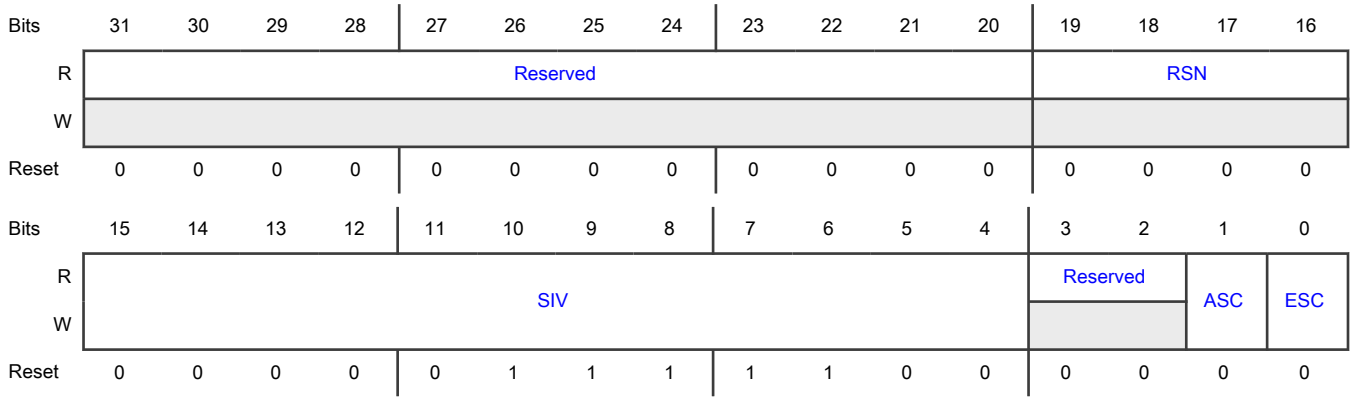
Offset

Register	Offset
DMA_CH0_Slot_Function_Control_Status	113Ch

Function

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Diagram



Fields

Field	Function
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0b - Advance Slot Check is disabled 1b - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application

Table continues on the next page...

Table continued from the previous page...

Field	Function
	and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0b - Slot Comparison is disabled 1b - Slot Comparison is enabled

76.17.350 DMA Channel 0 Current Application Transmit Descriptor (DMA_CH0_Current_App_TxDesc)

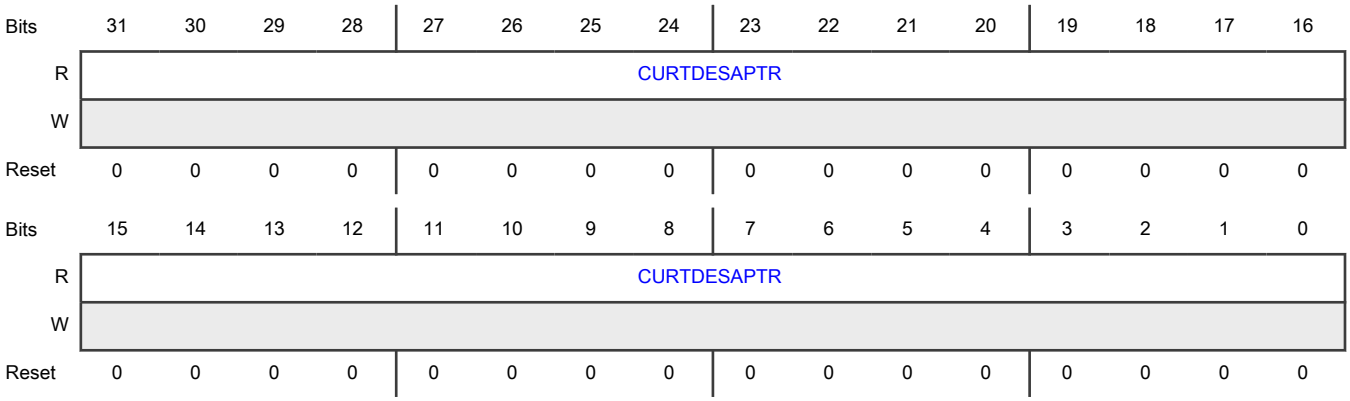
Offset

Register	Offset
DMA_CH0_Current_App_TxDesc	1144h

Function

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Diagram



Fields

Field	Function
31-0 CURTDESAPTR	Application Transmit Descriptor Address Pointer The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

76.17.351 DMA Channel 0 Current Application Receive Descriptor (DMA_CH0_Current_App_RxDesc)

Offset

Register	Offset
DMA_CH0_Current_App_RxDesc	114Ch

Function
The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

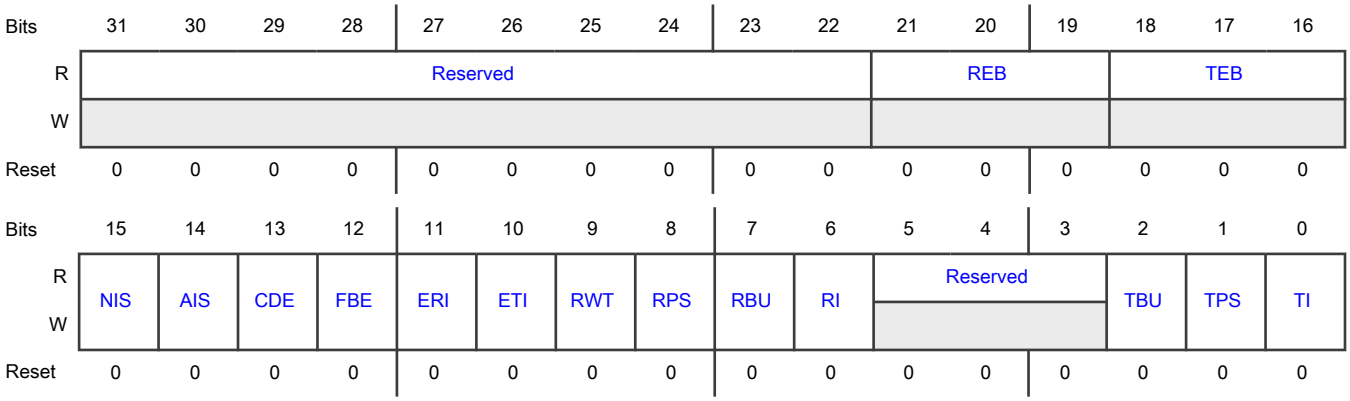
76.17.354 DMA Channel 0 Status (DMA_CH0_Status)

Offset

Register	Offset
DMA_CH0_Status	1160h

Function
The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA. Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Diagram



Fields

Field	Function
31-22 —	Reserved
21-19 REB	Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Table continues on the next page...

Table continued from the previous page...

Field	Function
18-16 TEB	Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Normal Interrupt Summary status not detected 1b - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Abnormal Interrupt Summary status not detected 1b - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Context Descriptor Error status not detected 1b - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Fatal Bus Error status not detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configurations supporting ERIC, - ERIC = 0: This bit is set only after the Rx DMA has completely filled up a receive buffer with packet data. - ERIC = 1: This bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Early Receive Interrupt status not detected 1b - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configurations supporting ERIC: - ETIC = 0: This bit is set only after the Tx DMA has transferred a complete packet to MTL. - ETIC = 1: This bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC = 1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Early Transmit Interrupt status not detected 1b - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0b - Receive Watchdog Timeout status not detected 1b - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Process Stopped status not detected 1b - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Buffer Unavailable status not detected 1b - Receive Buffer Unavailable status detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Interrupt status not detected 1b - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: - Change the ownership of the descriptor by setting Bit 31 of TDES3. - Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Buffer Unavailable status not detected 1b - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Process Stopped status not detected 1b - Transmit Process Stopped status detected
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Interrupt status not detected 1b - Transmit Interrupt status detected

76.17.355 DMA Channel 0 Miss Frame Counter (DMA_CH0_Miss_Frame_Cnt)

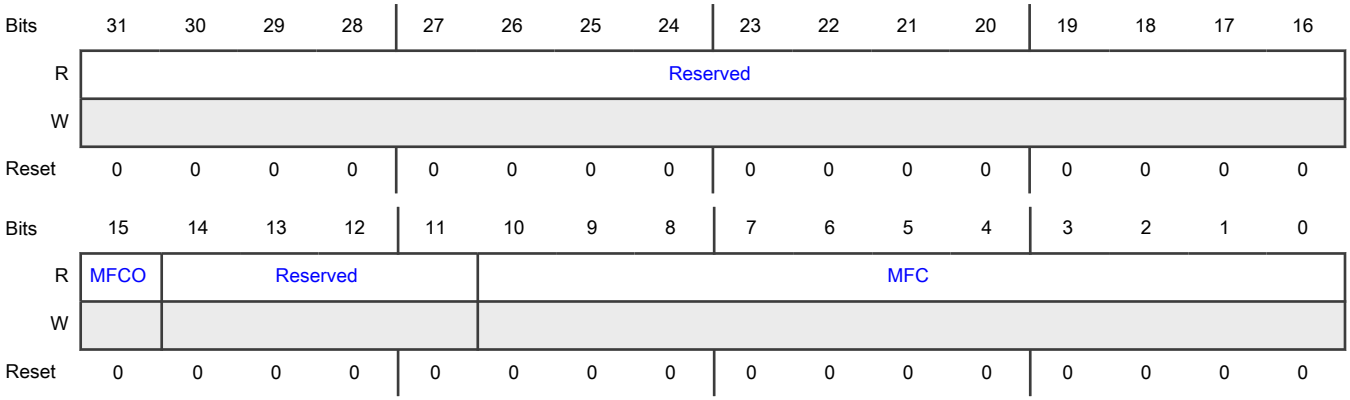
Offset

Register	Offset
DMA_CH0_Miss_Frame_Cnt	1164h

Function

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Diagram



Fields

Field	Function
31-16 —	Reserved
15 MFCO	Overflow status of the MFC Counter When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Miss Frame Counter overflow not occurred 1b - Miss Frame Counter overflow occurred
14-11 —	Reserved
10-0 MFC	Dropped Packet Counters This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

76.17.356 DMA Channel 0 Rx Parser Accept Count (DMA_CH0_RXP_Accept_Cnt)

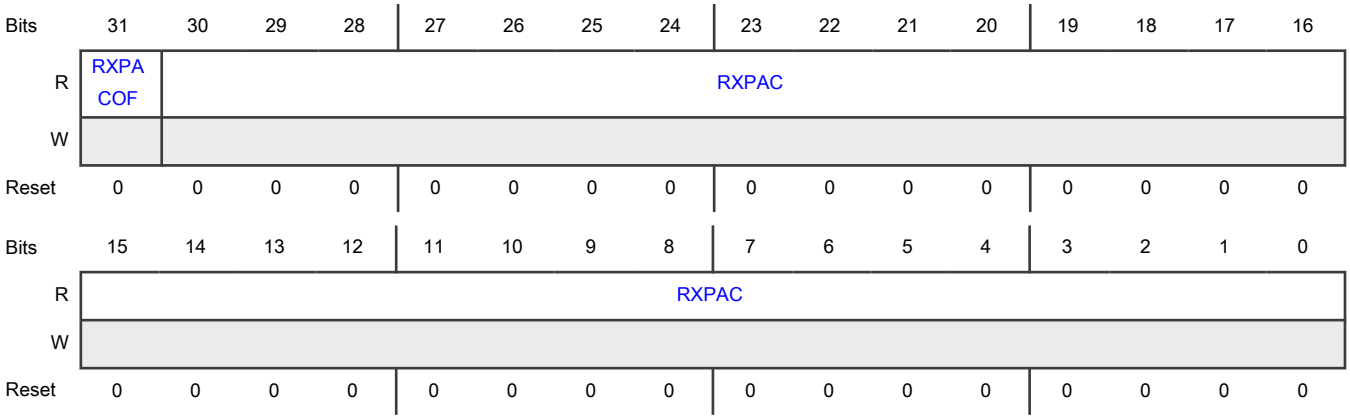
Offset

Register	Offset
DMA_CH0_RXP_Accept_Cnt	1168h

Function

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Diagram



Fields

Field	Function
31 RXPACOF	Rx Parser Accept Counter Overflow Bit When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Rx Parser Accept Counter overflow not occurred 1b - Rx Parser Accept Counter overflow occurred
30-0 RXPAC	Rx Parser Accept Counter This 31-bit counter is implemented when a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

76.17.357 DMA Channel 0 Rx ERI Count (DMA_CH0_RX_ERI_Cnt)

Offset

Register	Offset
DMA_CH0_RX_ERI_Cnt	116Ch

Function

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved

Fields

Field	Function
31-12 —	Reserved
11-0 ECNT	ERI Counter When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

76.17.358 DMA Channel 1 Control (DMA_CH1_Control)

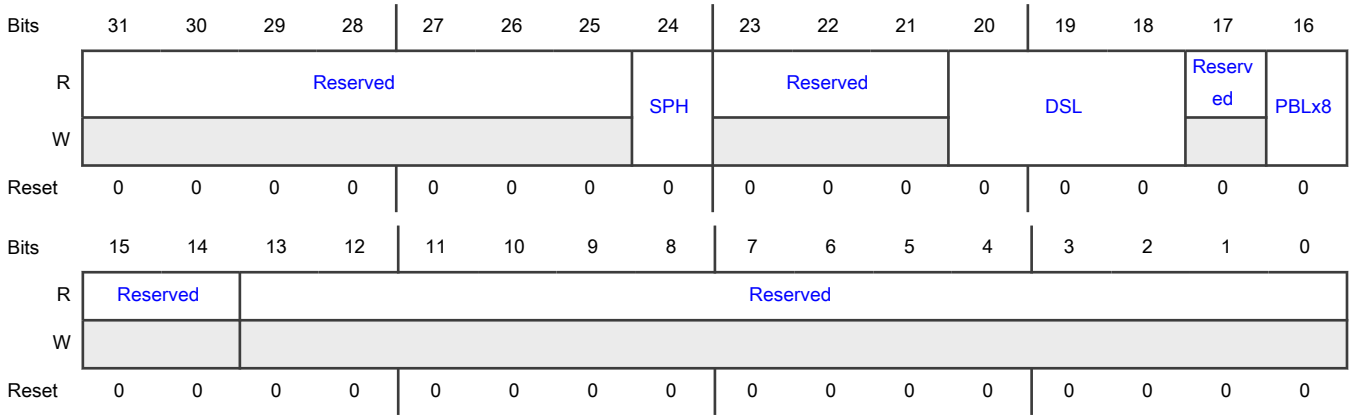
Offset

Register	Offset
DMA_CH1_Control	1180h

Function

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Diagram



Fields

Field	Function
31-25 —	Reserved
24 SPH	Split Headers When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0b - Split Headers feature is disabled 1b - Split Headers feature is enabled
23-21 —	Reserved
20-18 DSL	Descriptor Skip Length This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17 —	Reserved
16 PBLx8	8xPBL mode When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0b - 8xPBL mode is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - 8xPBL mode is enabled
15-14 —	Reserved
13-0 —	Reserved

76.17.359 DMA Channel 1 Tx Control (DMA_CH1_Tx_Control)

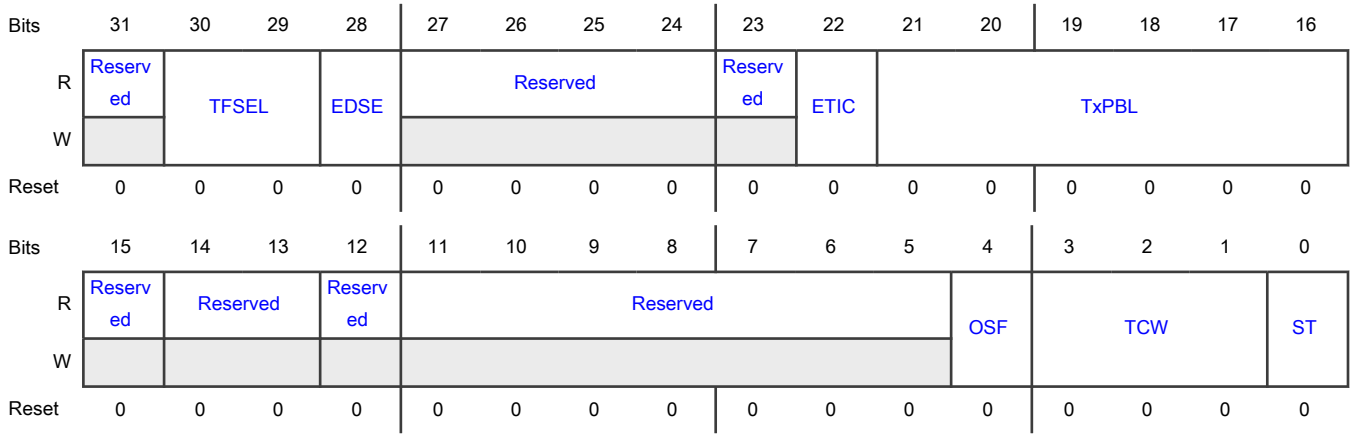
Offset

Register	Offset
DMA_CH1_Tx_Control	1184h

Function

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Diagram



Fields

Field	Function
31 —	Reserved
30-29	TBS Fetch Select

Table continues on the next page...

Table continued from the previous page...

Field	Function
TFSEL	Select bits for one of the four DMA_TBS_CTRL register fields (FTOS,FGSN,FTOV) for the channel Values: - 2'b00: DMA_TBS_CTRL0 - 2'b01: DMA_TBS_CTRL1 - 2'b10: DMA_TBS_CTRL2 - 2'b11: DMA_TBS_CTRL3 (Reserved if DWC_EQOS_NUM_DMA_TX_CH=3)
28 EDSE	Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0b - Enhanced Descriptor is disabled 1b - Enhanced Descriptor is enabled
27-24 —	Reserved
23 —	Reserved
22 ETIC	Early Transmit Interrupt Control When this bit is set, Early Transmit Interrupt (ETI) status is set after completion of transfer of data from buffers of a transmit descriptor in which IOC bit (TDES2[31]) is set. When this bit is reset, ETI is set only after a complete packet is transferred to the MTL TX FIFO memory. 0b - Early Transmit Interrupt is disabled 1b - Early Transmit Interrupt is enabled
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-13 —	Reserved
12 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0b - Operate on Second Packet disabled 1b - Operate on Second Packet enabled
3-1 TCW	Transmit Channel Weight This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0b - Stop Transmission Command 1b - Start Transmission Command

76.17.360 DMA Channel 1 Rx Control (DMA_CH1_Rx_Control)

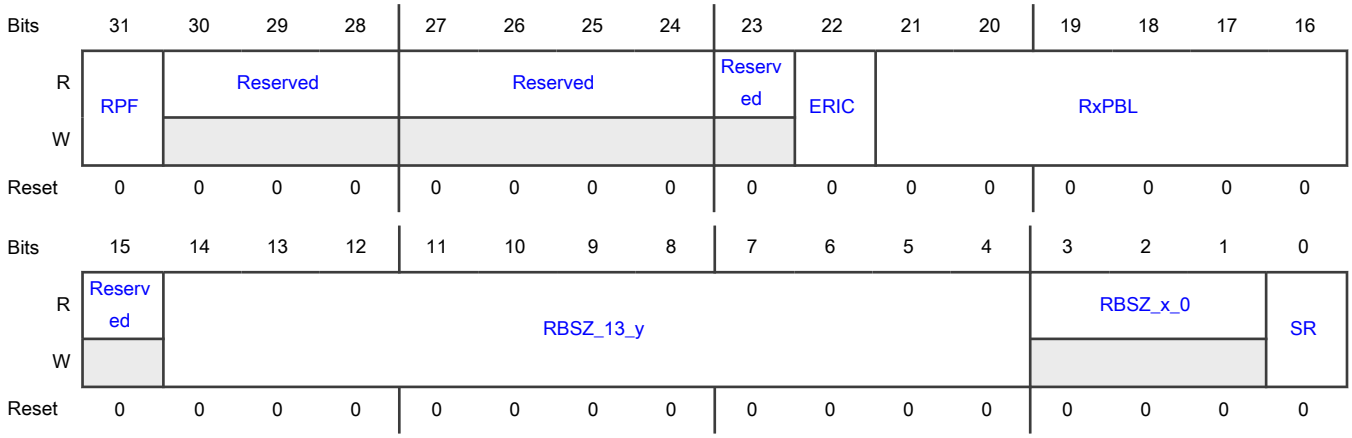
Offset

Register	Offset
DMA_CH1_Rx_Control	1188h

Function

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Diagram



Fields

Field	Function
31 RPF	Rx Packet Flush. - 1: DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, are flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing is done on the Read side of the Rx Queue. - 0: DWC_ether_qos does not flush the packet in the Rx Queue destined to this RxDMA Channel when it is in STOP state. This might cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0b - Rx Packet Flush is disabled 1b - Rx Packet Flush is enabled
30-28 —	Reserved
27-24 —	Reserved
23 —	Reserved
22 ERIC	Early Receive Interrupt Control When this bit is set, Early Receive Interrupt (ERI) status is set after the completion of every burst transfer of data from the Rx DMA to the buffer. When this bit is reset, ERI is set only after a complete buffer is filled up by the RxDMA. 0b - Early Receive Interrupt is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Early Receive Interrupt is enabled
21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0b - Stop Receive 1b - Start Receive

76.17.361 DMA Channel 1 Tx Descriptor List Address (DMA_CH1_TxDesc_List_Address)

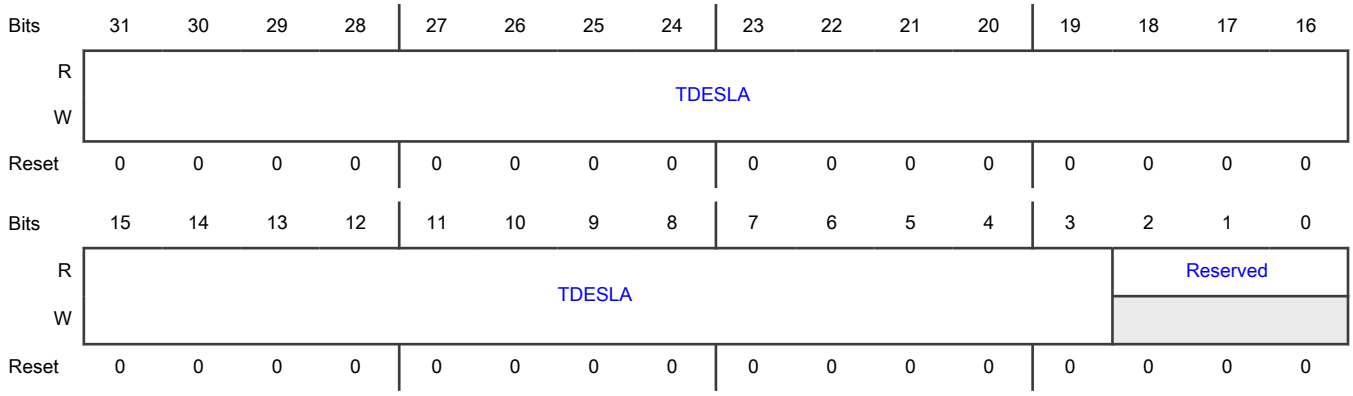
Offset

Register	Offset
DMA_CH1_TxDesc_List_Address	1194h

Function

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low. You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Diagram



Fields

Field	Function
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.362 DMA Channel 1 Rx Descriptor List Address (DMA_CH1_RxDesc_List_Address)

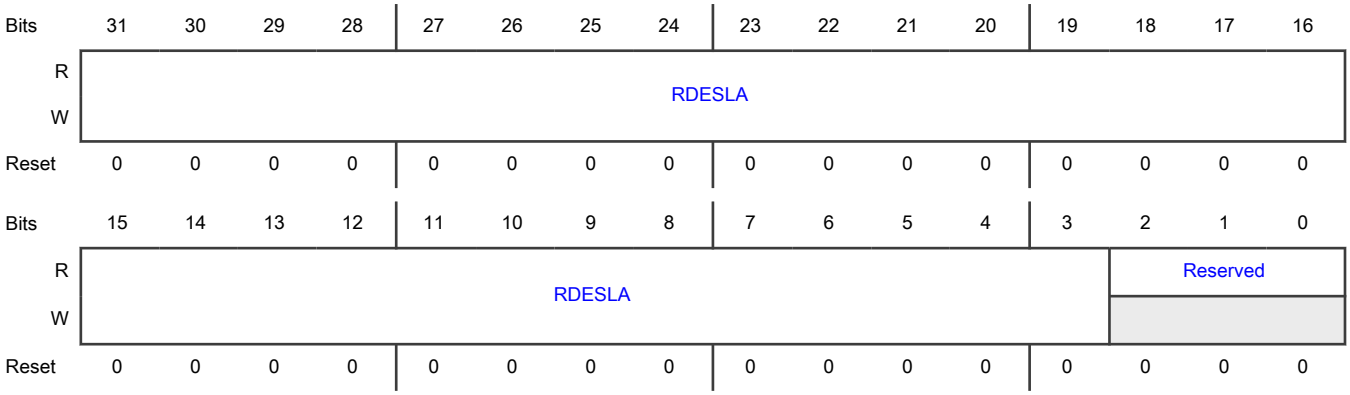
Offset

Register	Offset
DMA_CH1_RxDesc_List_Address	119Ch

Function

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list. This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Diagram



Fields

Field	Function
31-3 RDESLA	Start of Receive List This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.363 DMA Channel 1 Tx Descriptor Tail Pointer (DMA_CH1_TxDesc_Tail_Pointer)

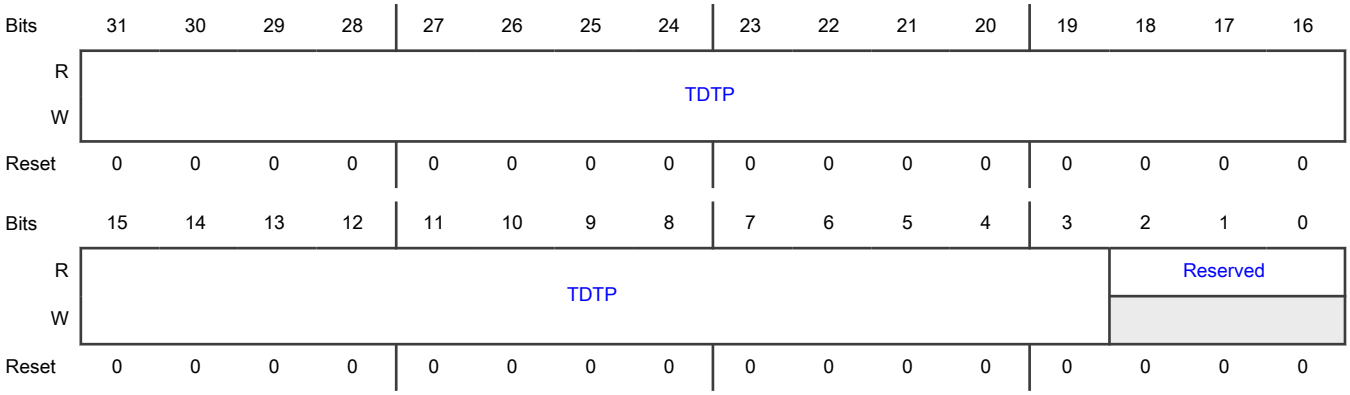
Offset

Register	Offset
DMA_CH1_TxDesc_Tail_Pointer	11A0h

Function

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Diagram



Fields

Field	Function
31-3 TDTP	Transmit Descriptor Tail Pointer This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.364 DMA Channel 1 Rx Descriptor Tail Pointer (DMA_CH1_RxDesc_Tail_Pointer)

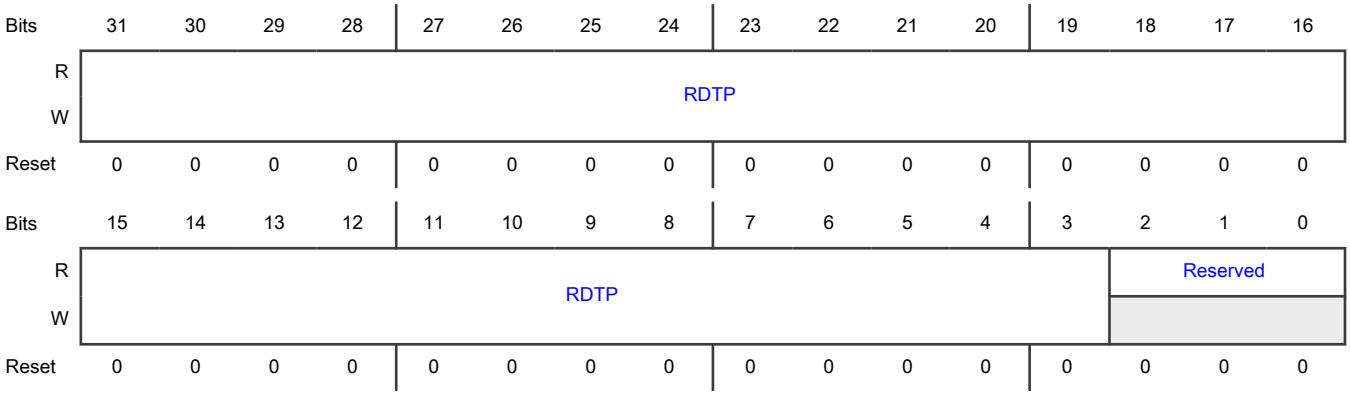
Offset

Register	Offset
DMA_CH1_RxDesc_Tail_Pointer	11A8h

Function

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Diagram



Fields

Field	Function
31-3 RDTP	Receive Descriptor Tail Pointer This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.365 DMA Channel 1 Tx Descriptor Ring Length (DMA_CH1_TxDesc_Ring_Length)

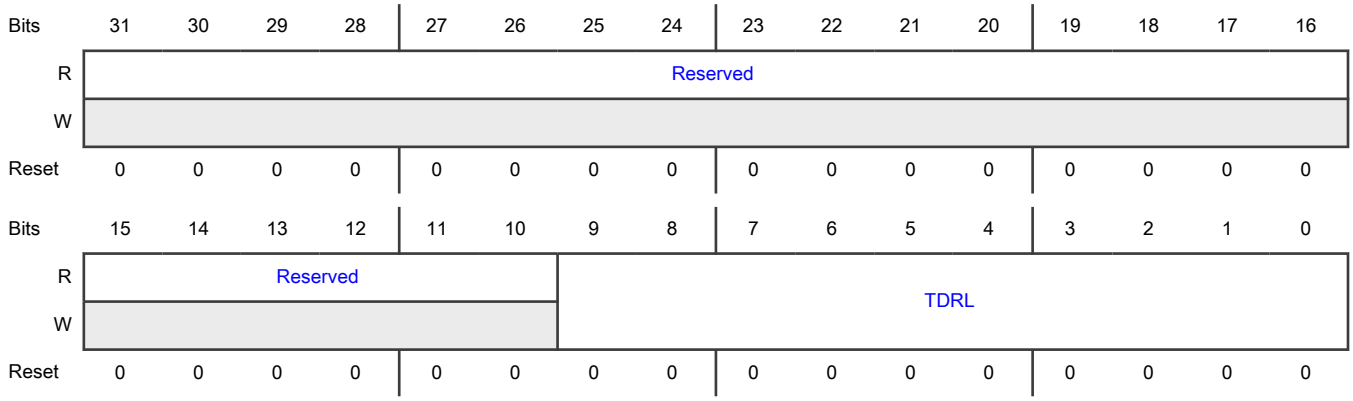
Offset

Register	Offset
DMA_CH1_TxDesc_Ring_Length	11ACh

Function

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Diagram



Fields

Field	Function
31-10 —	Reserved
9-0 TDRL	Transmit Descriptor Ring Length Transmit Descriptor Ring Length. This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. NXP recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

76.17.366 DMA Channel 1 Rx Control 2 (DMA_CH1_Rx_Control2)

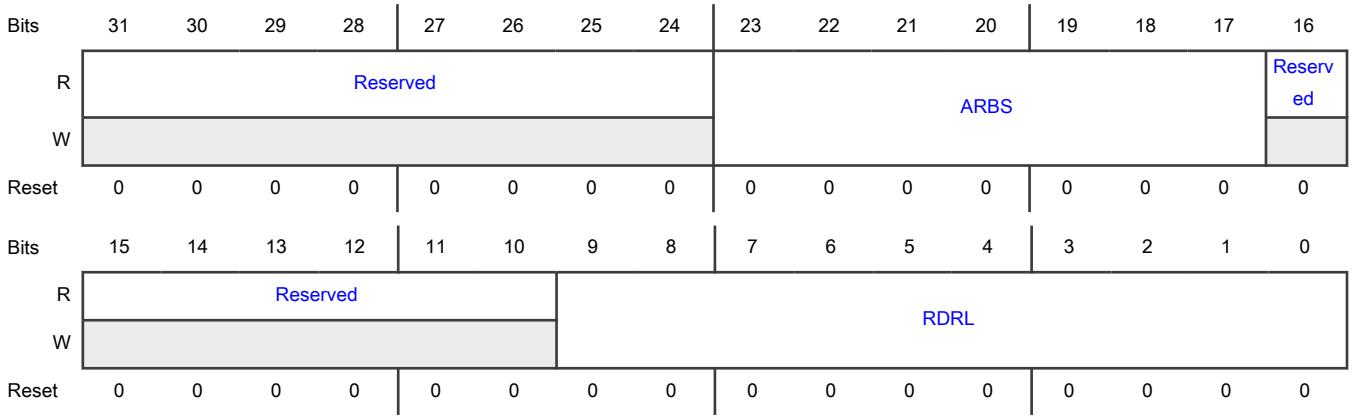
Offset

Register	Offset
DMA_CH1_Rx_Control2	11B0h

Function

The Channeli Receive Control register controls the Rx features such as Rx Descriptor Ring Length and Alternate Rx Buffer Size.

Diagram



Fields

Field	Function
31-24 —	Reserved
23-17 ARBS	Alternate Receive Buffer Size Indicates size in bytes for Buffer 1 when ARBS is programmed to a non-zero value (when split header feature is not enabled). When split header feature is enabled, ARBS indicates the buffer size for header data. The maximum alternate buffer is limited to 1020, 1016 or 1008-bytes depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). When ARBS=0, Rx Buffer1 and Rx Buffer2 sizes are based on RBSZ field of DMA_CH(#i)_Rx_Control. Width of ARBS field is 8, 7 or 6-bits depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively)
16-10 —	Reserved
9-0 RDRL	Receive Descriptor Ring Length This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

76.17.367 DMA Channel 1 Interrupt Enable (DMA_CH1_Interrupt_Enable)

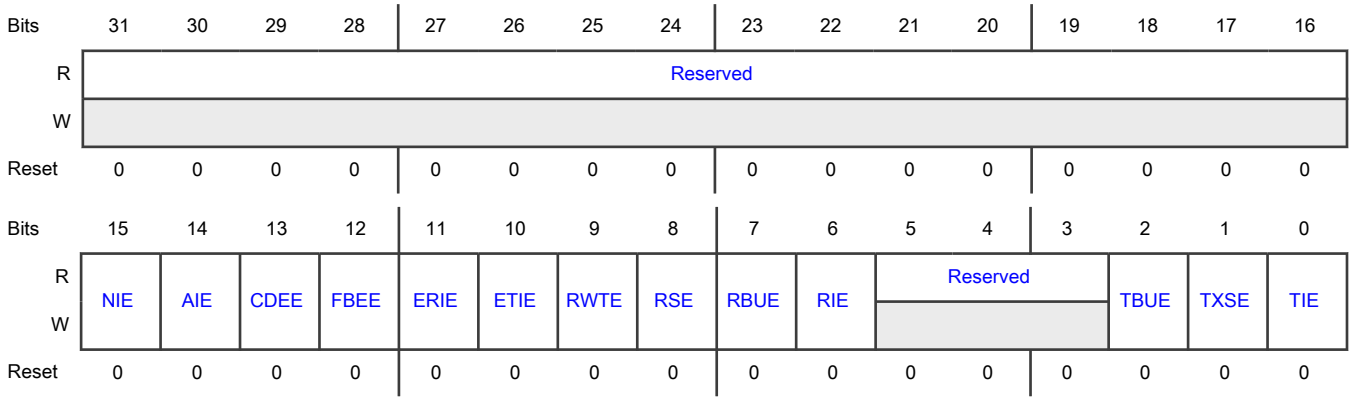
Offset

Register	Offset
DMA_CH1_Interrupt_Enable	11B4h

Function

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Diagram



Fields

Field	Function
31-16 —	Reserved
15 NIE	Normal Interrupt Summary Enable When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0b - Normal Interrupt Summary is disabled 1b - Normal Interrupt Summary is enabled
14 AIE	Abnormal Interrupt Summary Enable When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0b - Abnormal Interrupt Summary is disabled 1b - Abnormal Interrupt Summary is enabled
13 CDEE	Context Descriptor Error Enable When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0b - Context Descriptor Error is disabled 1b - Context Descriptor Error is enabled
12 FBEE	Fatal Bus Error Enable When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled.

Table continues on the next page...

Field	Function
	0b - Fatal Bus Error is disabled 1b - Fatal Bus Error is enabled
11 ERIE	Early Receive Interrupt Enable When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0b - Early Receive Interrupt is disabled 1b - Early Receive Interrupt is enabled
10 ETIE	Early Transmit Interrupt Enable When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0b - Early Transmit Interrupt is disabled 1b - Early Transmit Interrupt is enabled
9 RWTE	Receive Watchdog Timeout Enable When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0b - Receive Watchdog Timeout is disabled 1b - Receive Watchdog Timeout is enabled
8 RSE	Receive Stopped Enable When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0b - Receive Stopped is disabled 1b - Receive Stopped is enabled
7 RBUE	Receive Buffer Unavailable Enable When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0b - Receive Buffer Unavailable is disabled 1b - Receive Buffer Unavailable is enabled
6 RIE	Receive Interrupt Enable When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0b - Receive Interrupt is disabled 1b - Receive Interrupt is enabled
5-3	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
2 TBUE	Transmit Buffer Unavailable Enable When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0b - Transmit Buffer Unavailable is disabled 1b - Transmit Buffer Unavailable is enabled
1 TXSE	Transmit Stopped Enable When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0b - Transmit Stopped is disabled 1b - Transmit Stopped is enabled
0 TIE	Transmit Interrupt Enable When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0b - Transmit Interrupt is disabled 1b - Transmit Interrupt is enabled

76.17.368 DMA Channel 1 Rx Interrupt Watchdog Timer (DMA_CH1_Rx_Interrupt_Watchdog_Timer)

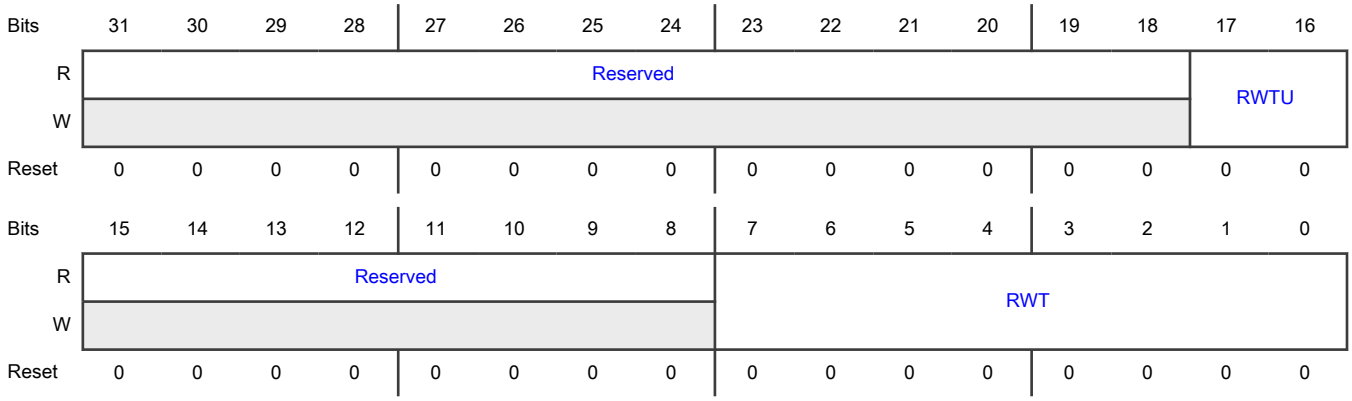
Offset

Register	Offset
DMA_CH1_Rx_Interrupt_Watchdog_Timer	11B8h

Function

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Diagram



Fields

Field	Function
31-18 —	Reserved
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

76.17.369 DMA Channel 1 Slot Function Control Status (DMA_CH1_Slot_Function_Control_Status)

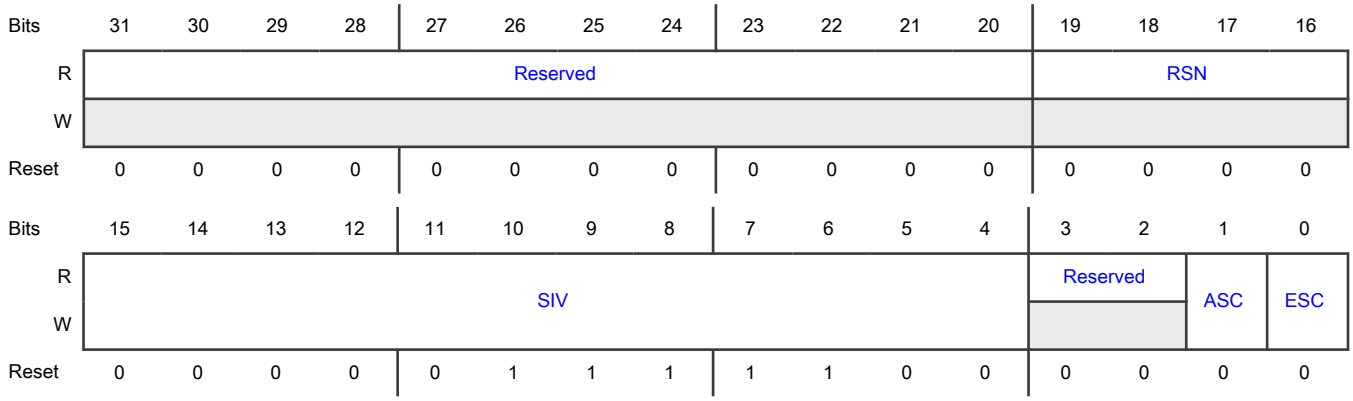
Offset

Register	Offset
DMA_CH1_Slot_Function_Control_Status	11BCh

Function

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Diagram



Fields

Field	Function
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0b - Advance Slot Check is disabled 1b - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application

Table continues on the next page...

Table continued from the previous page...

Field	Function
	and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0b - Slot Comparison is disabled 1b - Slot Comparison is enabled

76.17.370 DMA Channel 1 Current Application Transmit Descriptor (DMA_CH1_Current_App_TxDesc)

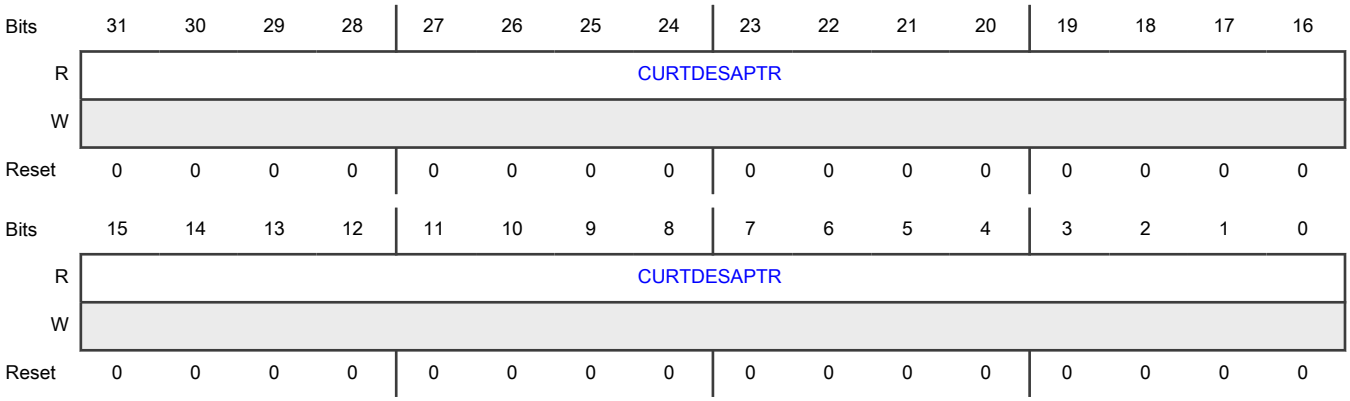
Offset

Register	Offset
DMA_CH1_Current_App_TxDesc	11C4h

Function

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Diagram



Fields

Field	Function
31-0 CURTDESAPTR	Application Transmit Descriptor Address Pointer The DMA updates this pointer during Tx operation. This pointer is cleared on reset.

76.17.371 DMA Channel 1 Current Application Receive Descriptor (DMA_CH1_Current_App_RxDesc)

Offset

Register	Offset
DMA_CH1_Current_App_RxDesc	11CCh

Function

The Channeli Current Application Receive Descriptor register points to the current Receive descriptor read by the DMA.

76.17.374 DMA Channel 1 Status (DMA_CH1_Status)

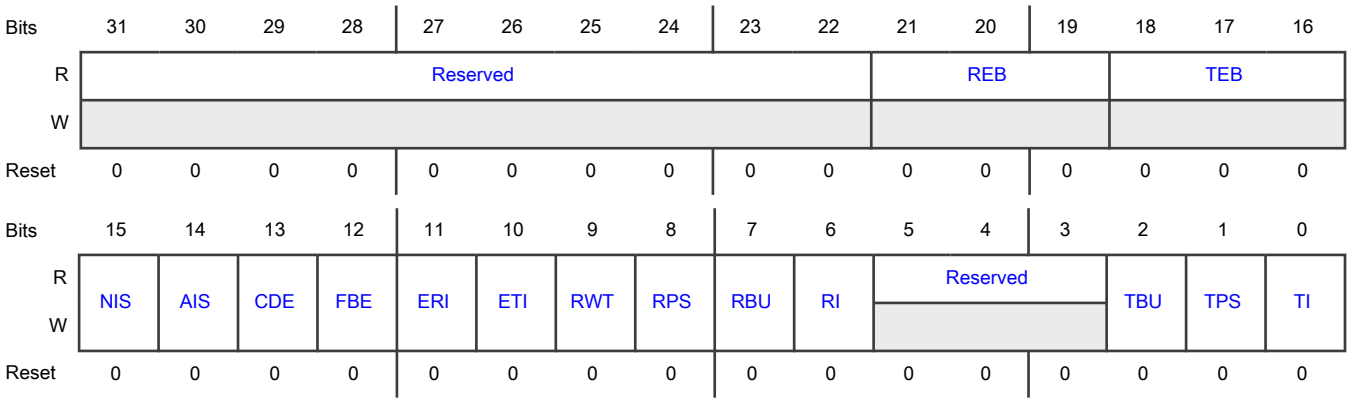
Offset

Register	Offset
DMA_CH1_Status	11E0h

Function

The software driver (application) reads the Status register during interrupt service routine or polling to determine the status of the DMA. Note: The number of DMA_CH(#i)_Status register in the configuration is the higher of number of Rx DMA Channels and Tx DMA Channels.

Diagram



Fields

Field	Function
31-22 —	Reserved
21-19 REB	Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Table continues on the next page...

Table continued from the previous page...

Field	Function
18-16 TEB	Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Normal Interrupt Summary status not detected 1b - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Abnormal Interrupt Summary status not detected 1b - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Context Descriptor Error status not detected 1b - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Fatal Bus Error status not detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configurations supporting ERIC, - ERIC = 0: This bit is set only after the Rx DMA has completely filled up a receive buffer with packet data. - ERIC = 1: This bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Early Receive Interrupt status not detected 1b - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configurations supporting ERIC: - ETIC = 0: This bit is set only after the Tx DMA has transferred a complete packet to MTL. - ETIC = 1: This bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC = 1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Early Transmit Interrupt status not detected 1b - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0b - Receive Watchdog Timeout status not detected 1b - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Process Stopped status not detected 1b - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Buffer Unavailable status not detected 1b - Receive Buffer Unavailable status detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Interrupt status not detected 1b - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: - Change the ownership of the descriptor by setting Bit 31 of TDES3. - Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Buffer Unavailable status not detected 1b - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Process Stopped status not detected 1b - Transmit Process Stopped status detected
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Interrupt status not detected 1b - Transmit Interrupt status detected

76.17.375 DMA Channel 1 Miss Frame Counter (DMA_CH1_Miss_Frame_Cnt)

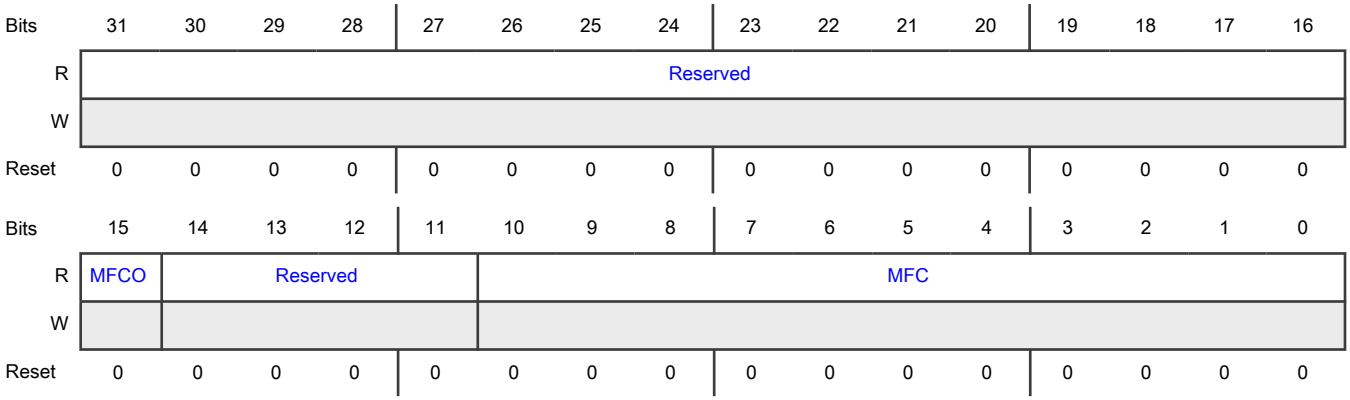
Offset

Register	Offset
DMA_CH1_Miss_Frame_Cnt	11E4h

Function

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Diagram



Fields

Field	Function
31-16 —	Reserved
15 MFCO	Overflow status of the MFC Counter When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Miss Frame Counter overflow not occurred 1b - Miss Frame Counter overflow occurred
14-11 —	Reserved
10-0 MFC	Dropped Packet Counters This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

76.17.376 DMA Channel 1 Rx Parser Accept Count (DMA_CH1_RXP_Accept_Cnt)

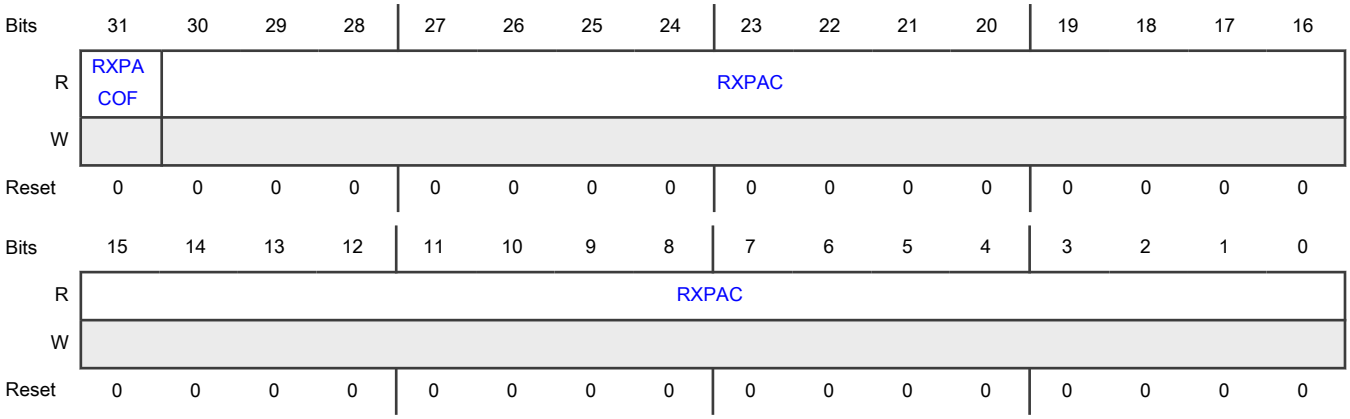
Offset

Register	Offset
DMA_CH1_RXP_Accept_Cnt	11E8h

Function

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Diagram



Fields

Field	Function
31 RXPACOF	Rx Parser Accept Counter Overflow Bit When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Rx Parser Accept Counter overflow not occurred 1b - Rx Parser Accept Counter overflow occurred
30-0 RXPAC	Rx Parser Accept Counter This 31-bit counter is implemented when a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

76.17.377 DMA Channel 1 Rx ERI Count (DMA_CH1_RX_ERI_Cnt)

Offset

Register	Offset
DMA_CH1_RX_ERI_Cnt	11ECh

Function

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Diagram

Fields

Field	Function
31-12 —	Reserved
11-0 ECNT	ERI Counter When ERIC bit of DMA_CH(#i)_RX_Control register is set, this counter increments for burst transfer completed by the Rx DMA from the start of packet transfer. This counter is reset at the start of new packet.

76.17.378 DMA Channel 2 Control (DMA_CH2_Control)

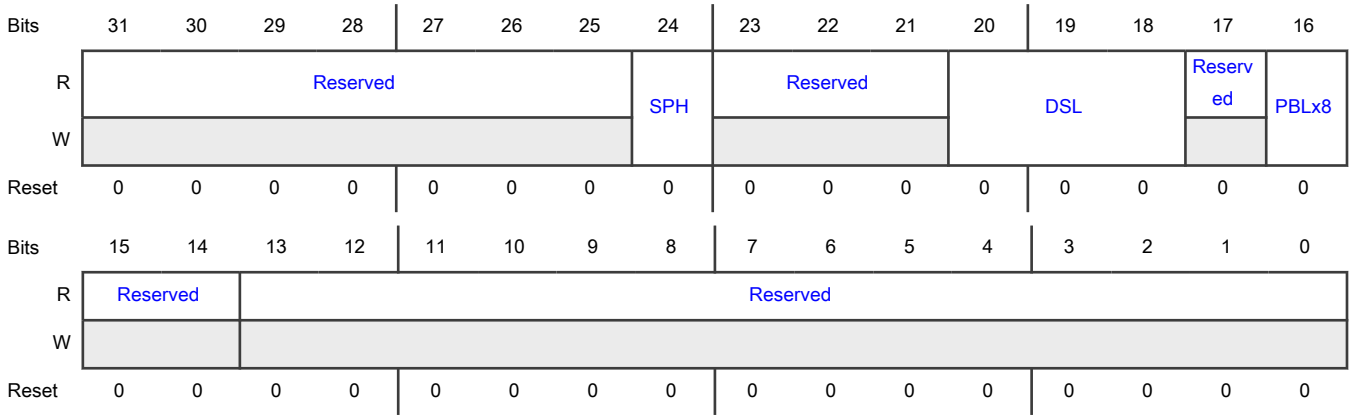
Offset

Register	Offset
DMA_CH2_Control	1200h

Function

The DMA Channeli Control register specifies the MSS value for segmentation, length to skip between two descriptors, and also the features such as header splitting and 8xPBL mode.

Diagram



Fields

Field	Function
31-25 —	Reserved
24 SPH	Split Headers When this bit is set, the DMA splits the header and payload in the Receive path. The DMA writes the header to the Buffer Address1 of RDES0. The DMA writes the payload to the buffer to which the Buffer Address2 is pointing. The software must ensure that the header fits into the Receive buffers. If the header length exceeds the receive buffer size, the DMA does not split the header and payload. This bit is available only if Enable Split Header Structure option is selected. 0b - Split Headers feature is disabled 1b - Split Headers feature is enabled
23-21 —	Reserved
20-18 DSL	Descriptor Skip Length This bit specifies the Word, Dword, or Lword number (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors. The address skipping starts from the end of the current descriptor to the start of the next descriptor. When the DSL value is equal to zero, the DMA takes the descriptor table as contiguous.
17 —	Reserved
16 PBLx8	8xPBL mode When this bit is set, the PBL value programmed in Bits[21:16] in DMA_CH(#i)_Tx_Control and Bits[21:16] in DMA_CH(#i)_Rx_Control is multiplied by eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. 0b - 8xPBL mode is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - 8xPBL mode is enabled
15-14 —	Reserved
13-0 —	Reserved

76.17.379 DMA Channel 2 Tx Control (DMA_CH2_Tx_Control)

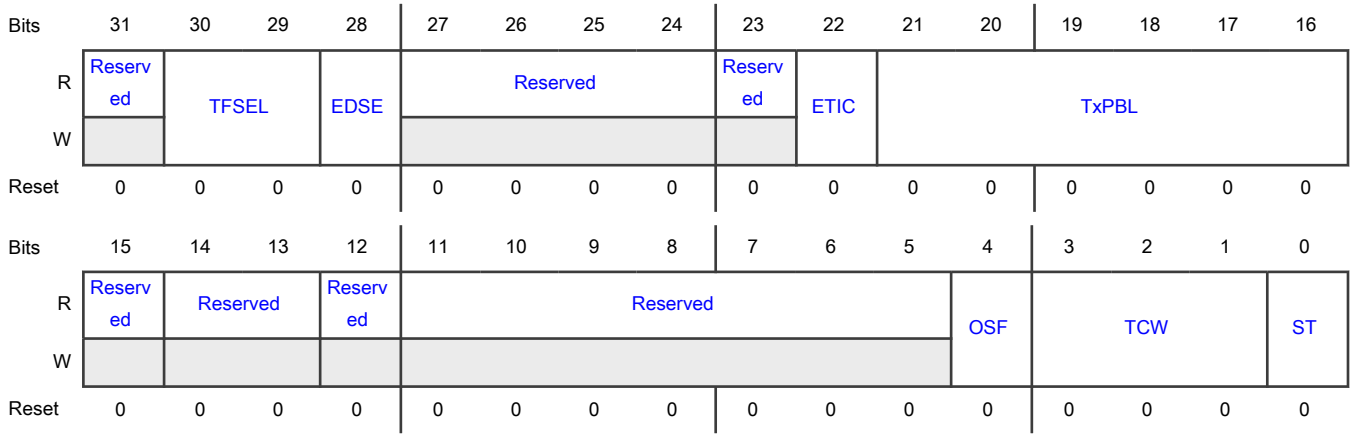
Offset

Register	Offset
DMA_CH2_Tx_Control	1204h

Function

The DMA Channeli Transmit Control register controls the Tx features such as PBL, TCP segmentation, and Tx Channel weights.

Diagram



Fields

Field	Function
31 —	Reserved
30-29	TBS Fetch Select

Table continues on the next page...

Table continued from the previous page...

Field	Function
TFSEL	Select bits for one of the four DMA_TBS_CTRL register fields (FTOS,FGSN,FTOV) for the channel Values: - 2'b00: DMA_TBS_CTRL0 - 2'b01: DMA_TBS_CTRL1 - 2'b10: DMA_TBS_CTRL2 - 2'b11: DMA_TBS_CTRL3 (Reserved if DWC_EQOS_NUM_DMA_TX_CH=3)
28 EDSE	Enhanced Descriptor Enable When this bit is set, the corresponding channel uses Enhanced Descriptors that are 32 Bytes for both Normal and Context Descriptors. When reset, the corresponding channel uses the descriptors that are 16 Bytes. 0b - Enhanced Descriptor is disabled 1b - Enhanced Descriptor is enabled
27-24 —	Reserved
23 —	Reserved
22 ETIC	Early Transmit Interrupt Control When this bit is set, Early Transmit Interrupt (ETI) status is set after completion of transfer of data from buffers of a transmit descriptor in which IOC bit (TDES2[31]) is set. When this bit is reset, ETI is set only after a complete packet is transferred to the MTL TX FIFO memory. 0b - Early Transmit Interrupt is disabled 1b - Early Transmit Interrupt is enabled
21-16 TxPBL	Transmit Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in DMA_CH0_Control register. 2. Set the TxPBL. Note: The maximum value of TxPBL must be less than or equal to half the Tx Queue size (TQS field of MTL_TxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Tx Queue has space to store at least another Tx PBL worth of data while the MTL Tx Queue Controller is transferring data to MAC. For example, in 64-bit data width configurations the total locations in Tx Queue of size 512 bytes is 64, TxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-13 —	Reserved
12 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
11-5 —	Reserved
4 OSF	Operate on Second Packet When this bit is set, it instructs the DMA to process the second packet of the Transmit data even before the status for the first packet is obtained. 0b - Operate on Second Packet disabled 1b - Operate on Second Packet enabled
3-1 TCW	Transmit Channel Weight This field indicates the weight assigned to the corresponding Transmit channel. When reset is complete, this field is set to 0 for all channels by default, resulting in equal weights to all channels.
0 ST	Start or Stop Transmission Command When this bit is set, transmission is placed in the Running state. The DMA checks the Transmit list at the current position for a packet to be transmitted. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the base address of the Transmit list set by the DMA_CH0_TxDesc_List_Address register. - The position at which the transmission was previously stopped If the DMA does not own the current descriptor, the transmission enters the Suspended state and the TBU bit of the DMA_CH0_Status register is set. The Start Transmission command is effective only when the transmission is stopped. If the command is issued before setting the DMA_CH0_TxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the transmission process is placed in the Stopped state after completing the transmission of the current packet. The Next Descriptor position in the Transmit list is saved, and it becomes the current position when the transmission is restarted. To change the list address, you need to program DMA_CH0_TxDesc_List_Address register with a new value when this bit is reset. The new value is considered when this bit is set again. The stop transmission command is effective only when the transmission of the current packet is complete or the transmission is in the Suspended state. 0b - Stop Transmission Command 1b - Start Transmission Command

76.17.380 DMA Channel 2 Rx Control (DMA_CH2_Rx_Control)

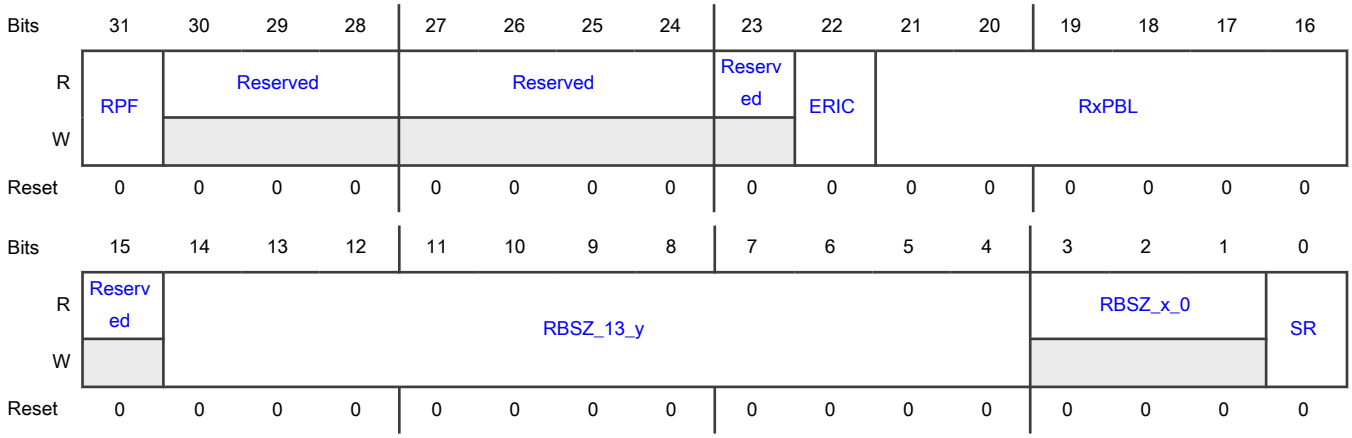
Offset

Register	Offset
DMA_CH2_Rx_Control	1208h

Function

The DMA Channeli Receive Control register controls the Rx features such as PBL, buffer size, and extended status.

Diagram



Fields

Field	Function
31 RPF	Rx Packet Flush. - 1: DWC_ether_qos automatically flushes the packet from the Rx Queues destined to this DMA Rx Channel, when it is stopped. When this bit remains set and the DMA is re-started by the software driver, the packets residing in the Rx Queues that were received when this RxDMA was stopped, are flushed out. The packets that are received by the MAC after the RxDMA is re-started are routed to the RxDMA. The flushing is done on the Read side of the Rx Queue. - 0: DWC_ether_qos does not flush the packet in the Rx Queue destined to this RxDMA Channel when it is in STOP state. This might cause head-of-line blocking in the corresponding RxQueue. Note: The stopping of packet flow from a Rx DMA Channel to the application by setting RPF works only when there is one-to-one mapping of Rx Queue to Rx DMA channels. In Dynamic mapping mode, setting RPF bit in any DMA_CH(#i)_Rx_Control register might flush packets from unintended Rx Queues which are destined to the stopped Rx DMA Channel. 0b - Rx Packet Flush is disabled 1b - Rx Packet Flush is enabled
30-28 —	Reserved
27-24 —	Reserved
23 —	Reserved
22 ERIC	Early Receive Interrupt Control When this bit is set, Early Receive Interrupt (ERI) status is set after the completion of every burst transfer of data from the Rx DMA to the buffer. When this bit is reset, ERI is set only after a complete buffer is filled up by the RxDMA. 0b - Early Receive Interrupt is disabled

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Early Receive Interrupt is enabled
21-16 RxPBL	Receive Programmable Burst Length These bits indicate the maximum number of beats to be transferred in one DMA block data transfer. The DMA always attempts max burst as specified in PBL each time it starts a burst transfer on the application bus. You can program PBL with any of the following values: 1, 2, 4, 8, 16, or 32. Any other value results in undefined behavior. To transfer more than 32 beats, perform the following steps: 1. Set the 8xPBL mode in the DMA_CH0_Control register. 2. Set the RxPBL. Note: The maximum value of RxPBL must be less than or equal to half the Rx Queue size (RQS field of MTL_RxQ(#i)_Operation_Mode register) in terms of beats. This is required so that the Rx Queue has space to store at least another Rx PBL worth of data while the Rx DMA is transferring a block of data. For example, in 64-bit data width configurations the total locations in Rx Queue of size 512 bytes is 64, so RxPBL and 8xPBL needs to be programmed to less than or equal to 32.
15 —	Reserved
14-4 RBSZ_13_y	Receive Buffer size High RBSZ[13:0] is split into two fields higher RBSZ_13_y and lower RBSZ_x_0. The RBSZ[13:0] field indicates the size of the Rx buffers specified in bytes. The maximum buffer size is limited to 16K bytes. The buffer size is applicable to payload buffers when split headers are enabled. Note: The buffer size must be a multiple of 4, 8, or 16 depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). This is required even if the value of buffer address pointer is not aligned to data bus width. Hence the lower RBSZ_x_0 bits are read-only and the value is considered as all-zero. Thus the RBSZ_13_y indicates the buffer size in terms of locations (with the width same as bus-width).
3-1 RBSZ_x_0	Receive Buffer size Low RBSZ[13:0] is split into two fields RBSZ_13_y and RBSZ_x_0. The RBSZ_x_0 is the lower field whose width is based on data bus width of the configuration. This field is of width 2, 3, or 4 bits for 32-bit, 64-bit, or 128-bit data bus width respectively. This field is read-only (RO).
0 SR	Start or Stop Receive When this bit is set, the DMA tries to acquire the descriptor from the Receive list and processes the incoming packets. The DMA tries to acquire descriptor from either of the following positions: - The current position in the list This is the address set by the DMA_CH0_RxDesc_List_Address register. - The position at which the Rx process was previously stopped If the DMA does not own the current descriptor, the reception is suspended and the RBU bit of the DMA_CH0_Status register is set. The Start Receive command is effective only when the reception is stopped. If the command is issued before setting the DMA_CH0_RxDesc_List_Address register, the DMA behavior is unpredictable. When this bit is reset, the Rx DMA operation is stopped after the transfer of the current packet. The next descriptor position in the Receive list is saved, and it becomes the current position after the Rx process is restarted. The Stop Receive command is effective only when the Rx process is in the Running (waiting for Rx packet) or Suspended state. 0b - Stop Receive 1b - Start Receive

76.17.381 DMA Channel 2 Tx Descriptor List Address (DMA_CH2_TxDesc_List_Address)

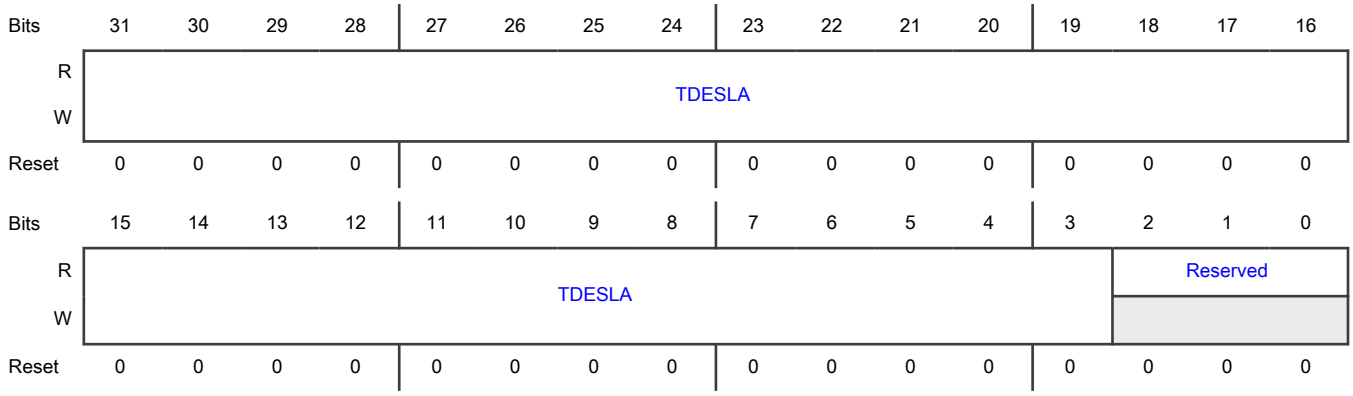
Offset

Register	Offset
DMA_CH2_TxDesc_List_Address	1214h

Function

The Channeli Tx Descriptor List Address register points the DMA to the start of Transmit descriptor list. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LSB to low. You can write to this register only when the Tx DMA has stopped, that is, the ST bit is set to zero in DMA_CH0_Tx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the ST bit to 1, the DMA takes the newly-programmed descriptor base address. If this register is not changed when the ST bit is set to 0, the DMA takes the descriptor address where it was stopped earlier.

Diagram



Fields

Field	Function
31-3 TDESLA	Start of Transmit List This field contains the base address of the first descriptor in the Transmit descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.382 DMA Channel 2 Rx Descriptor List Address (DMA_CH2_RxDesc_List_Address)

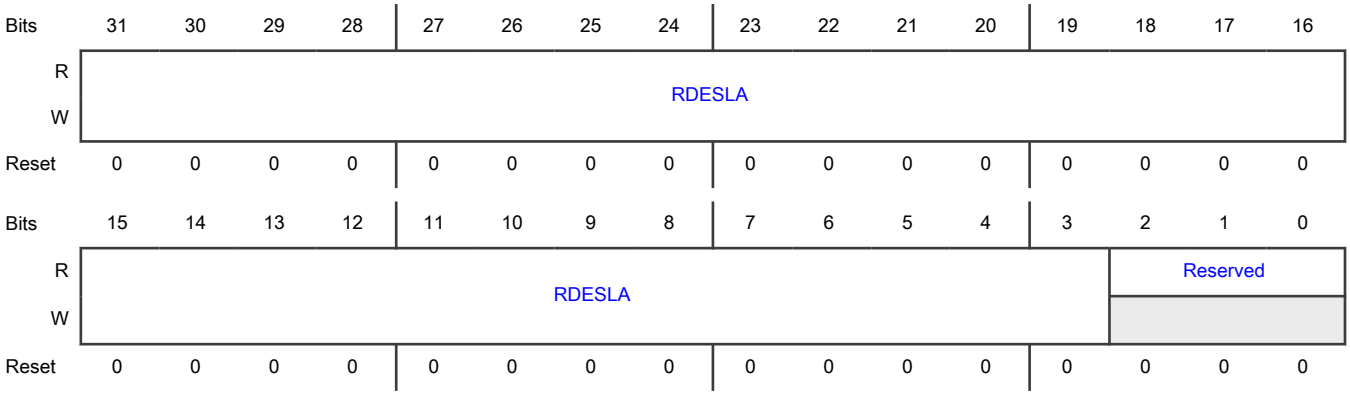
Offset

Register	Offset
DMA_CH2_RxDesc_List_Address	121Ch

Function

The Channeli Rx Descriptor List Address register points the DMA to the start of Receive descriptor list. This register points to the start of the Receive Descriptor List. The descriptor lists reside in the physical memory space of the application and must be Word, Dword, or Lword-aligned (for 32-bit, 64-bit, or 128-bit data bus). The DMA internally converts it to bus width aligned address by making the corresponding LS bits low. Writing to this register is permitted only when reception is stopped. When stopped, this register must be written to before the receive Start command is given. You can write to this register only when Rx DMA has stopped, that is, SR bit is set to zero in DMA_CH0_Rx_Control register. When stopped, this register can be written with a new descriptor list address. When you set the SR bit to 1, the DMA takes the newly programmed descriptor base address.

Diagram



Fields

Field	Function
31-3 RDESLA	Start of Receive List This field contains the base address of the first descriptor in the Rx Descriptor list. The DMA ignores the LSB bits (1:0, 2:0, or 3:0) for 32-bit, 64-bit, or 128-bit bus width and internally takes these bits as all-zero. Therefore, these LSB bits are read-only (RO). The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.383 DMA Channel 2 Tx Descriptor Tail Pointer (DMA_CH2_TxDesc_Tail_Pointer)

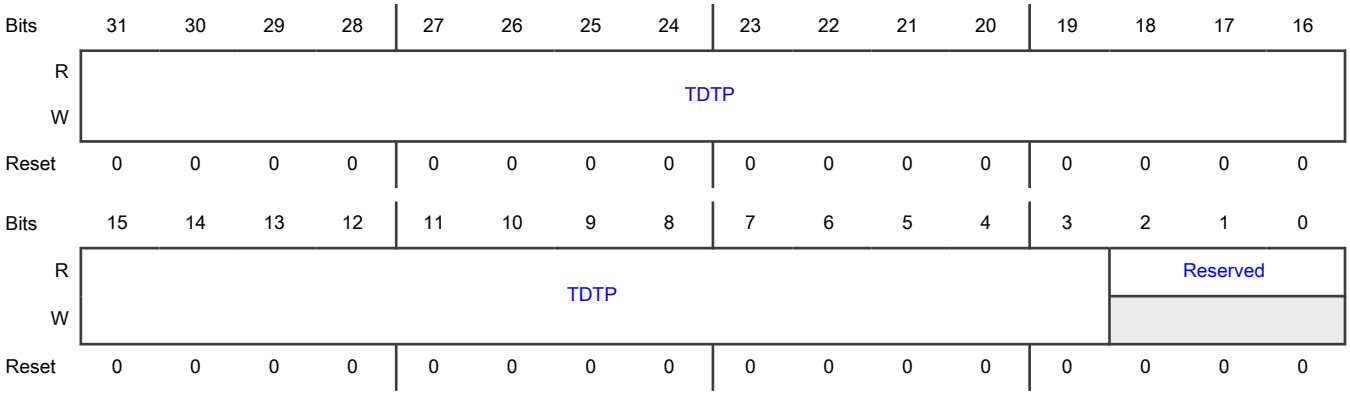
Offset

Register	Offset
DMA_CH2_TxDesc_Tail_Pointer	1220h

Function

The Channeli Tx Descriptor Tail Pointer register points to an offset from the base and indicates the location of the last valid descriptor.

Diagram



Fields

Field	Function
31-3 TDTP	Transmit Descriptor Tail Pointer This field contains the tail pointer for the Tx descriptor ring. The software writes the tail pointer to add more descriptors to the Tx channel. The hardware tries to transmit all packets referenced by the descriptors between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.384 DMA Channel 2 Rx Descriptor Tail Pointer (DMA_CH2_RxDesc_Tail_Pointer)

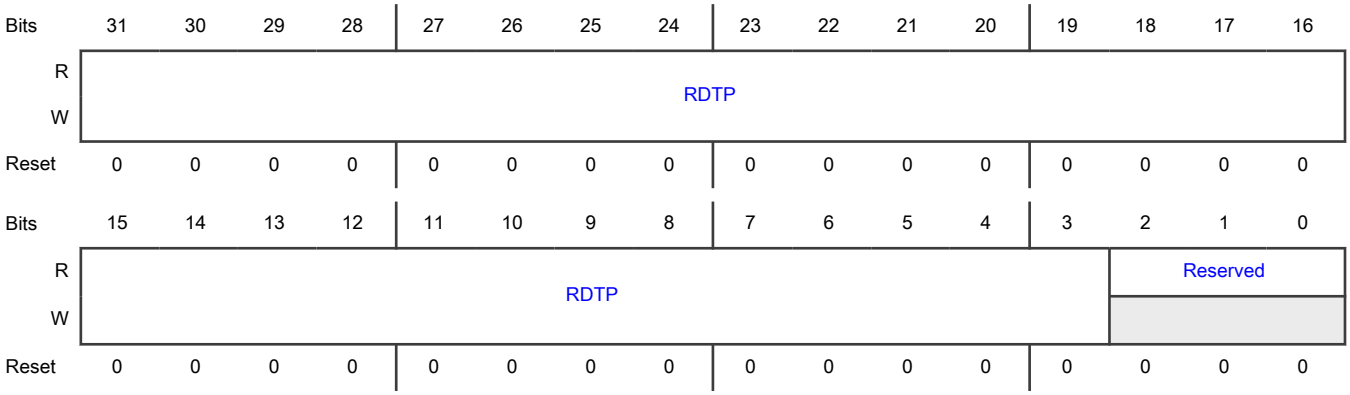
Offset

Register	Offset
DMA_CH2_RxDesc_Tail_Pointer	1228h

Function

The Channeli Rx Descriptor Tail Pointer Points to an offset from the base and indicates the location of the last valid descriptor.

Diagram



Fields

Field	Function
31-3 RDTP	Receive Descriptor Tail Pointer This field contains the tail pointer for the Rx descriptor ring. The software writes the tail pointer to add more descriptors to the Rx channel. The hardware tries to write all received packets to the descriptors referenced between the head and the tail pointer registers. The width of this field depends on the configuration: - 31:2 for 32-bit configuration - 31:3 for 64-bit configuration - 31:4 for 128-bit configuration
2-0 —	Reserved

76.17.385 DMA Channel 2 Tx Descriptor Ring Length (DMA_CH2_TxDesc_Ring_Length)

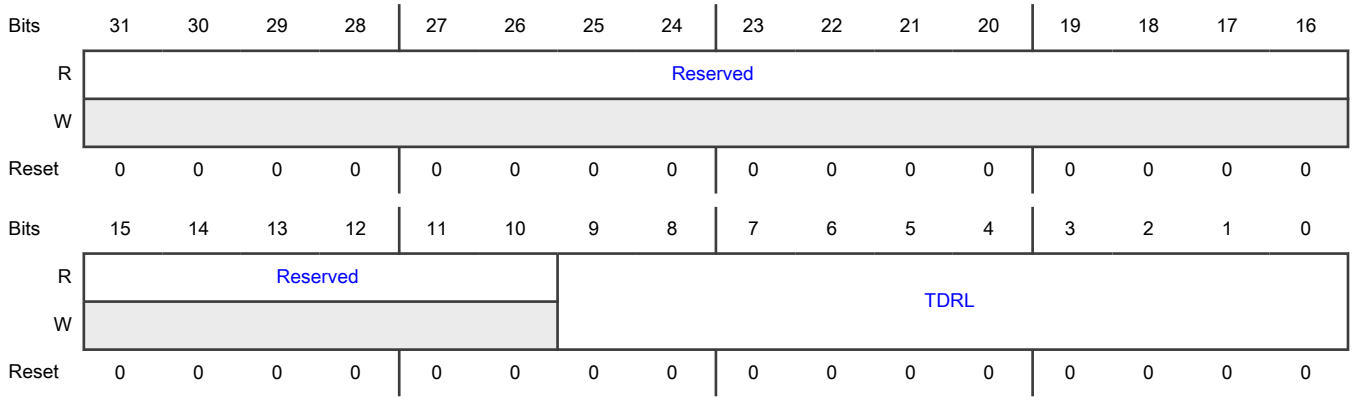
Offset

Register	Offset
DMA_CH2_TxDesc_Ring_Length	122Ch

Function

The Tx Descriptor Ring Length register contains the length of the Transmit descriptor ring.

Diagram



Fields

Field	Function
31-10 —	Reserved
9-0 TDRL	Transmit Descriptor Ring Length Transmit Descriptor Ring Length. This field sets the maximum number of Tx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. NXP recommends a minimum ring descriptor length of 4. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

76.17.386 DMA Channel 2 Rx Control 2 (DMA_CH2_Rx_Control2)

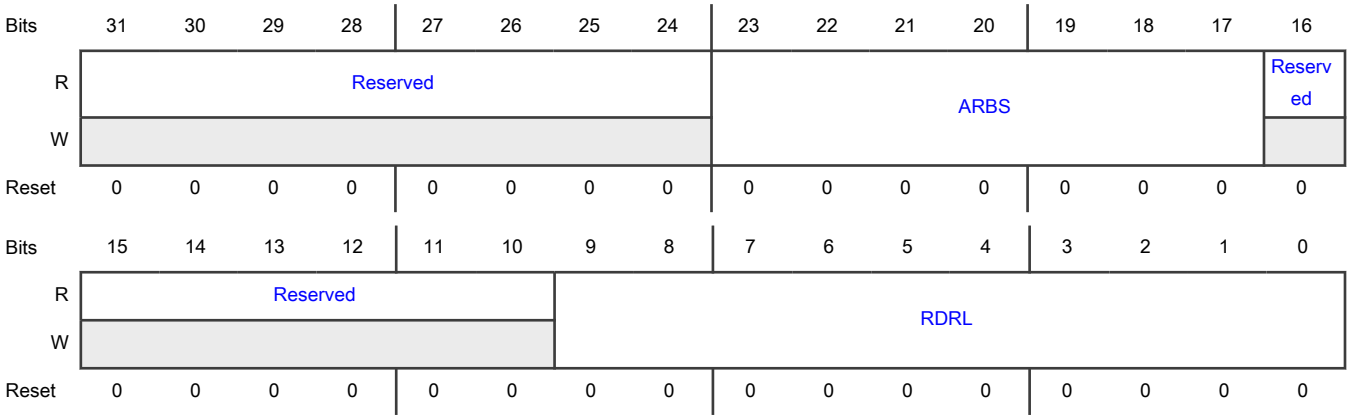
Offset

Register	Offset
DMA_CH2_Rx_Control2	1230h

Function

The Channeli Receive Control register controls the Rx features such as Rx Descriptor Ring Length and Alternate Rx Buffer Size.

Diagram



Fields

Field	Function
31-24 —	Reserved
23-17 ARBS	Alternate Receive Buffer Size Indicates size in bytes for Buffer 1 when ARBS is programmed to a non-zero value (when split header feature is not enabled). When split header feature is enabled, ARBS indicates the buffer size for header data. The maximum alternate buffer is limited to 1020, 1016 or 1008-bytes depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively). When ARBS=0, Rx Buffer1 and Rx Buffer2 sizes are based on RBSZ field of DMA_CH(#i)_Rx_Control. Width of ARBS field is 8, 7 or 6-bits depending on the data bus widths (32-bit, 64-bit, or 128-bit respectively)
16-10 —	Reserved
9-0 RDRL	Receive Descriptor Ring Length This register sets the maximum number of Rx descriptors in the circular descriptor ring. The maximum number of descriptors is limited to 1K descriptors. For example, You can program any value up to 0x3FF in this field. This field is 10 bits wide, if you program 0x3FF, you can have 1024 descriptors. If you want to have 10 descriptors, program it to a value of 0x9.

76.17.387 DMA Channel 2 Interrupt Enable (DMA_CH2_Interrupt_Enable)

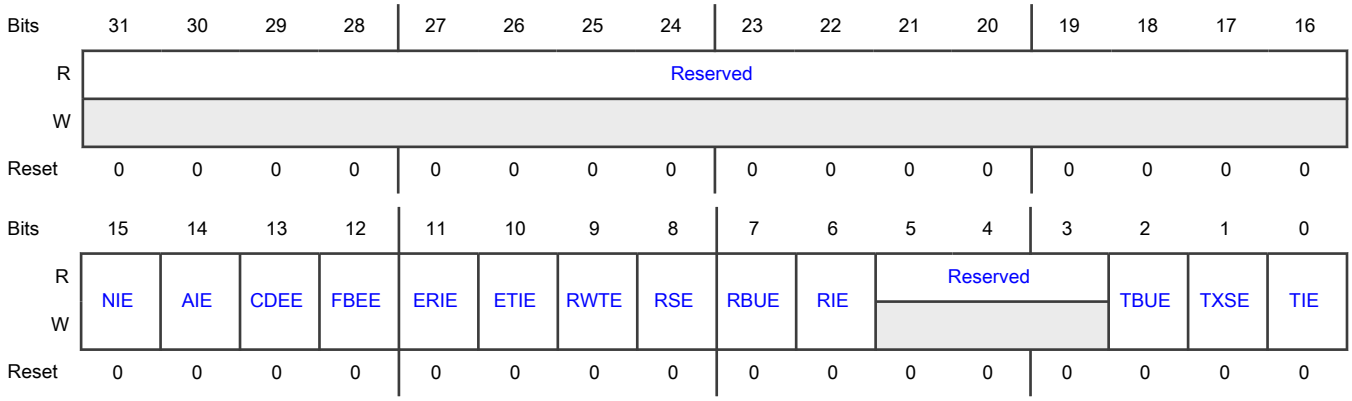
Offset

Register	Offset
DMA_CH2_Interrupt_Enable	1234h

Function

The Channeli Interrupt Enable register enables the interrupts reported by the Status register.

Diagram



Fields

Field	Function
31-16 —	Reserved
15 NIE	Normal Interrupt Summary Enable When this bit is set, the normal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt When this bit is reset, the normal interrupt summary is disabled. 0b - Normal Interrupt Summary is disabled 1b - Normal Interrupt Summary is enabled
14 AIE	Abnormal Interrupt Summary Enable When this bit is set, the abnormal interrupt summary is enabled. This bit enables the following interrupts in the DMA_CH0_Status register: - Bit 1: Transmit Process Stopped - Bit 7: Rx Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 9: Receive Watchdog Timeout - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error When this bit is reset, the abnormal interrupt summary is disabled. 0b - Abnormal Interrupt Summary is disabled 1b - Abnormal Interrupt Summary is enabled
13 CDEE	Context Descriptor Error Enable When this bit is set along with the AIE bit, the Descriptor error interrupt is enabled. When this bit is reset, the Descriptor error interrupt is disabled. 0b - Context Descriptor Error is disabled 1b - Context Descriptor Error is enabled
12 FBEE	Fatal Bus Error Enable When this bit is set along with the AIE bit, the Fatal Bus error interrupt is enabled. When this bit is reset, the Fatal Bus Error error interrupt is disabled.

Field	Function
	0b - Fatal Bus Error is disabled 1b - Fatal Bus Error is enabled
11 ERIE	Early Receive Interrupt Enable When this bit is set along with the NIE bit, the Early Receive interrupt is enabled. When this bit is reset, the Early Receive interrupt is disabled. 0b - Early Receive Interrupt is disabled 1b - Early Receive Interrupt is enabled
10 ETIE	Early Transmit Interrupt Enable When this bit is set along with the AIE bit, the Early Transmit interrupt is enabled. When this bit is reset, the Early Transmit interrupt is disabled. 0b - Early Transmit Interrupt is disabled 1b - Early Transmit Interrupt is enabled
9 RWTE	Receive Watchdog Timeout Enable When this bit is set along with the AIE bit, the Receive Watchdog Timeout interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout interrupt is disabled. 0b - Receive Watchdog Timeout is disabled 1b - Receive Watchdog Timeout is enabled
8 RSE	Receive Stopped Enable When this bit is set along with the AIE bit, the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped interrupt is disabled. 0b - Receive Stopped is disabled 1b - Receive Stopped is enabled
7 RBUE	Receive Buffer Unavailable Enable When this bit is set along with the AIE bit, the Receive Buffer Unavailable interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable interrupt is disabled. 0b - Receive Buffer Unavailable is disabled 1b - Receive Buffer Unavailable is enabled
6 RIE	Receive Interrupt Enable When this bit is set along with the NIE bit, the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. 0b - Receive Interrupt is disabled 1b - Receive Interrupt is enabled
5-3	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
2 TBUE	Transmit Buffer Unavailable Enable When this bit is set along with the NIE bit, the Transmit Buffer Unavailable interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable interrupt is disabled. 0b - Transmit Buffer Unavailable is disabled 1b - Transmit Buffer Unavailable is enabled
1 TXSE	Transmit Stopped Enable When this bit is set along with the AIE bit, the Transmission Stopped interrupt is enabled. When this bit is reset, the Transmission Stopped interrupt is disabled. 0b - Transmit Stopped is disabled 1b - Transmit Stopped is enabled
0 TIE	Transmit Interrupt Enable When this bit is set along with the NIE bit, the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. 0b - Transmit Interrupt is disabled 1b - Transmit Interrupt is enabled

76.17.388 DMA Channel 2 Rx Interrupt Watchdog Timer (DMA_CH2_Rx_Interrupt_Watchdog_Timer)

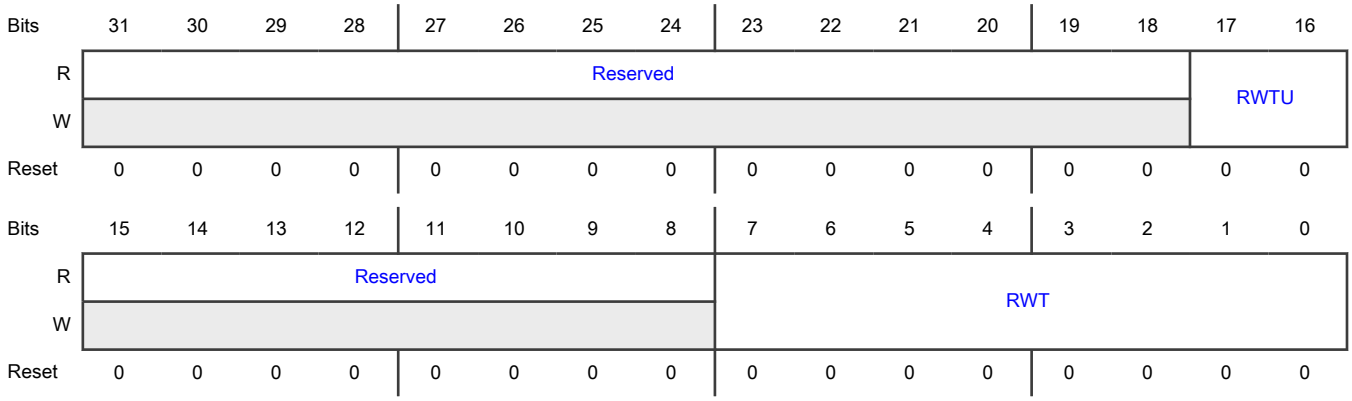
Offset

Register	Offset
DMA_CH2_Rx_Interrupt_Watchdog_Timer	1238h

Function

The Receive Interrupt Watchdog Timer register indicates the watchdog timeout for Receive Interrupt (RI) from the DMA. When this register is written with a non-zero value, it enables the watchdog timer for the RI bit of the DMA_CHi_Status register.

Diagram



Fields

Field	Function
31-18 —	Reserved
17-16 RWTU	Receive Interrupt Watchdog Timer Count Units This fields indicates the number of system clock cycles corresponding to one unit in RWT field. - 2'b00: 256 - 2'b01: 512 - 2'b10: 1024 - 2'b11: 2048 For example, when RWT=2 and RWTU=1, the watchdog timer is set for 2*512=1024 system clock cycles.
15-8 —	Reserved
7-0 RWT	Receive Interrupt Watchdog Timer Count This field indicates the number of system clock cycles, multiplied by factor indicated in RWTU field, for which the watchdog timer is set. The watchdog timer is triggered with the programmed value after the Rx DMA completes the transfer of a packet for which the RI bit is not set in the DMA_CH(#i)_Status register, because of the setting of Interrupt Enable bit in the corresponding descriptor RDES3[30]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per the Interrupt Enable bit RDES3[30] of any received packet.

76.17.389 DMA Channel 2 Slot Function Control Status (DMA_CH2_Slot_Function_Control_Status)

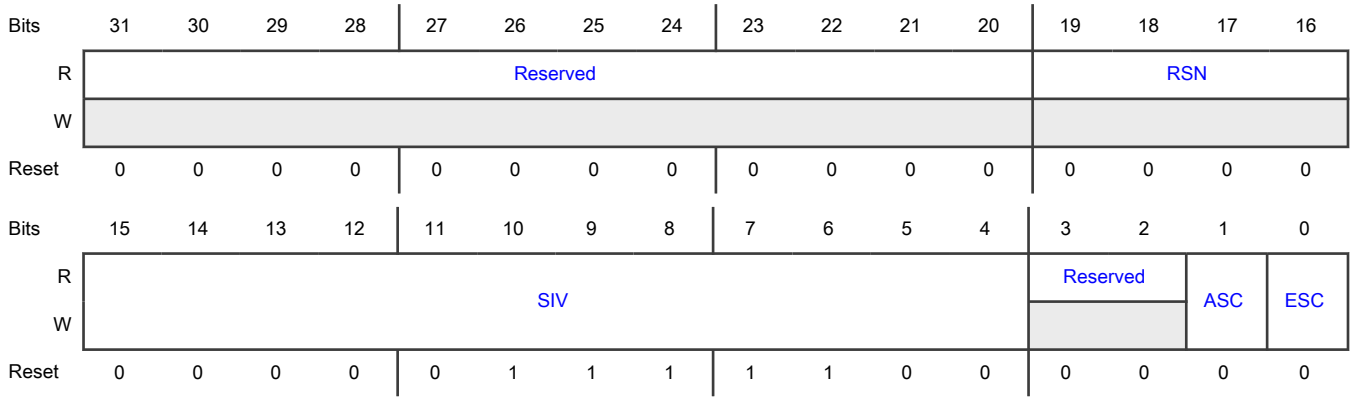
Offset

Register	Offset
DMA_CH2_Slot_Function_Control_Status	123Ch

Function

The Slot Function Control and Status register contains the control bits for slot function and the status for Transmit path.

Diagram



Fields

Field	Function
31-20 —	Reserved
19-16 RSN	Reference Slot Number This field gives the current value of the reference slot number in the DMA. It is used for slot comparison.
15-4 SIV	Slot Interval Value This field controls the period of the slot interval in which the TxDMA fetches the scheduled packets. A value of 0 specifies the slot interval of 1 us while the maximum value 4095 specifies the slot interval of 4096us. The default/reset value is 0x07C which corresponds to slot interval of 125us
3-2 —	Reserved
1 ASC	Advance Slot Check When set, this bit enables the DMA to fetch the data from the buffer when the slot number (SLOTNUM) programmed in the Tx descriptor is - equal to the reference slot number given in the RSN field or - ahead of the reference slot number by up to two slots This bit is applicable only when the ESC bit is set. 0b - Advance Slot Check is disabled 1b - Advance Slot Check is enabled
0 ESC	Enable Slot Comparison When set, this bit enables the checking of the slot numbers programmed in the Tx descriptor with the current reference given in the RSN field. The DMA fetches the data from the corresponding buffer only when the slot number is - equal to the reference slot number or - ahead of the reference slot number by one slot When reset, this bit disables the checking of the slot numbers. The DMA fetches the data immediately after the descriptor is processed. Note: The UFO (UDP Fragmentation over IPv4)/TSO/USO should not be enabled along with TBS/AVB Slot number check. The UFO/TSO/USO involves multiple packets/segments/fragments transmission for single packet received from application

Table continues on the next page...

Table continued from the previous page...

Field	Function
	and the slot number check are applicable for fetching of only first segment/fragment. As a result it might be difficult for software to specify slot number for subsequent packets. 0b - Slot Comparison is disabled 1b - Slot Comparison is enabled

76.17.390 DMA Channel 2 Current Application Transmit Descriptor (DMA_CH2_Current_App_TxDesc)

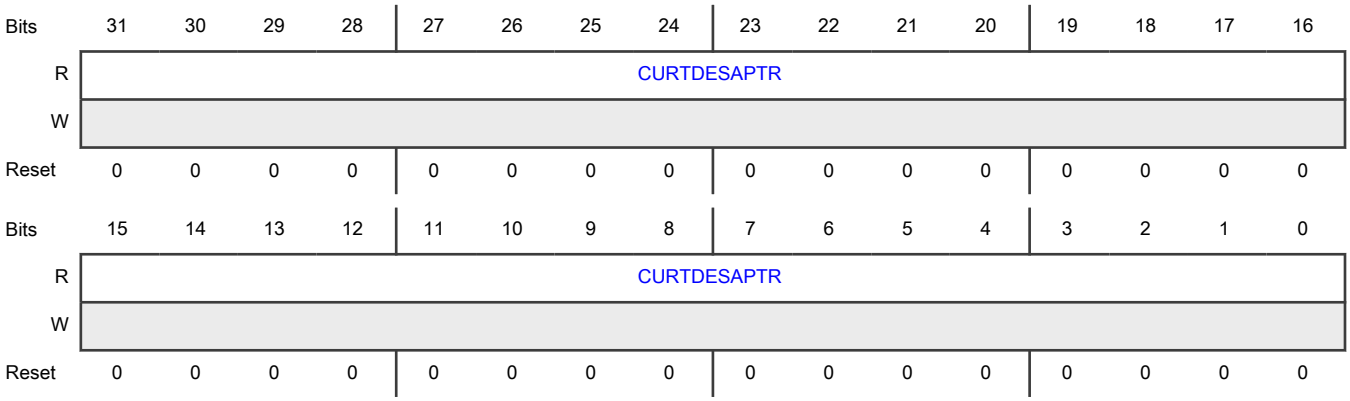
Offset

Register	Offset
DMA_CH2_Current_App_TxDesc	1244h

Function

The Channeli Current Application Transmit Descriptor register points to the current Transmit descriptor read by the DMA.

Diagram



Fields

Field	Function
31-22 —	Reserved
21-19 REB	Rx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 21 -- 1'b1: Error during data transfer by Rx DMA -- 1'b0: No Error during data transfer by Rx DMA - Bit 20 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 19 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.

Table continues on the next page...

Table continued from the previous page...

Field	Function
18-16 TEB	Tx DMA Error Bits This field indicates the type of error that caused a Bus Error. For example, error response on the AHB or AXI interface. - Bit 18 -- 1'b1: Error during data transfer by Tx DMA -- 1'b0: No Error during data transfer by Tx DMA - Bit 17 -- 1'b1: Error during descriptor access -- 1'b0: Error during data buffer access - Bit 16 -- 1'b1: Error during read transfer -- 1'b0: Error during write transfer This field is valid only when the FBE bit is set. This field does not generate an interrupt.
15 NIS	Normal Interrupt Summary Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 0: Transmit Interrupt - Bit 2: Transmit Buffer Unavailable - Bit 6: Receive Interrupt - Bit 11: Early Receive Interrupt Only unmasked bits (interrupts for which interrupt enable is set in DMA_CH0_Interrupt_Enable register) affect the Normal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit which causes NIS to be set is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Normal Interrupt Summary status not detected 1b - Normal Interrupt Summary status detected
14 AIS	Abnormal Interrupt Summary Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in the DMA_CH0_Interrupt_Enable register: - Bit 1: Transmit Process Stopped - Bit 7: Receive Buffer Unavailable - Bit 8: Receive Process Stopped - Bit 10: Early Transmit Interrupt - Bit 12: Fatal Bus Error - Bit 13: Context Descriptor Error Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit. You must clear this bit (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Abnormal Interrupt Summary status not detected 1b - Abnormal Interrupt Summary status detected
13 CDE	Context Descriptor Error This bit indicates that the DMA Tx/Rx engine received a descriptor error, which indicates invalid context in the middle of packet flow (intermediate descriptor) or all one's descriptor in Tx case and on Rx side it indicates DMA has read a descriptor with either of the buffer address as ones which is considered to be invalid. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Context Descriptor Error status not detected 1b - Context Descriptor Error status detected
12 FBE	Fatal Bus Error This bit indicates that a bus error occurred (as described in the EB field). When this bit is set, the corresponding DMA channel engine disables all bus accesses. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Fatal Bus Error status not detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Fatal Bus Error status detected
11 ERI	Early Receive Interrupt This bit when set indicates that the RxDMA has completed the transfer of packet data to the memory. In configurations supporting ERIC, - ERIC = 0: This bit is set only after the Rx DMA has completely filled up a receive buffer with packet data. - ERIC = 1: This bit is set after every burst transfer of data from the Rx DMA to the buffer. The setting of RI bit automatically clears this bit. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Early Receive Interrupt status not detected 1b - Early Receive Interrupt status detected
10 ETI	Early Transmit Interrupt This bit when set indicates that the TxDMA has completed the transfer of packet data to the MTL TXFIFO memory. In configurations supporting ERIC: - ETIC = 0: This bit is set only after the Tx DMA has transferred a complete packet to MTL. - ETIC = 1: This bit is set after completion of (partial) packet data transfer from buffers in the Transmit descriptor in which IOC = 1. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Early Transmit Interrupt status not detected 1b - Early Transmit Interrupt status detected
9 RWT	Receive Watchdog Timeout This bit is asserted when a packet with length greater than 2,048 bytes (10,240 bytes when Jumbo Packet mode is enabled) is received. 0b - Receive Watchdog Timeout status not detected 1b - Receive Watchdog Timeout status detected
8 RPS	Receive Process Stopped This bit is asserted when the Rx process enters the Stopped state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Process Stopped status not detected 1b - Receive Process Stopped status detected
7 RBU	Receive Buffer Unavailable This bit indicates that the application owns the next descriptor in the Receive list, and the DMA cannot acquire it. The Rx process is suspended. To resume processing Rx descriptors, the application should change the ownership of the descriptor and issue a Receive Poll Demand command. If this command is not issued, the Rx process resumes when the next recognized incoming packet is received. In ring mode, the application should advance the Receive Descriptor Tail Pointer register of a channel. This bit is set only when the DMA owns the previous Rx descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Buffer Unavailable status not detected 1b - Receive Buffer Unavailable status detected

Table continues on the next page...

Table continued from the previous page...

Field	Function
6 RI	Receive Interrupt This bit indicates that the packet reception is complete. When packet reception is complete, Bit 31 of RDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. The reception remains in the Running state. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Receive Interrupt status not detected 1b - Receive Interrupt status detected
5-3 —	Reserved
2 TBU	Transmit Buffer Unavailable This bit indicates that the application owns the next descriptor in the Transmit list, and the DMA cannot acquire it. Transmission is suspended. The TPS0 field of the DMA_Debug_Status0 register explains the Transmit Process state transitions. To resume processing the Transmit descriptors, the application should do the following: - Change the ownership of the descriptor by setting Bit 31 of TDES3. - Issue a Transmit Poll Demand command. For ring mode, the application should advance the Transmit Descriptor Tail Pointer register of a channel. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Buffer Unavailable status not detected 1b - Transmit Buffer Unavailable status detected
1 TPS	Transmit Process Stopped This bit is set when the transmission is stopped. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Process Stopped status not detected 1b - Transmit Process Stopped status detected
0 TI	Transmit Interrupt This bit indicates that the packet transmission is complete. When transmission is complete, Bit 31 of TDES3 is reset in the last descriptor, and the specific packet status information is updated in the descriptor. Access restriction applies. Self-set to 1 on internal event. Setting 1 clears. Setting 0 has no effect. 0b - Transmit Interrupt status not detected 1b - Transmit Interrupt status detected

76.17.395 DMA Channel 2 Miss Frame Count (DMA_CH2_Miss_Frame_Cnt)

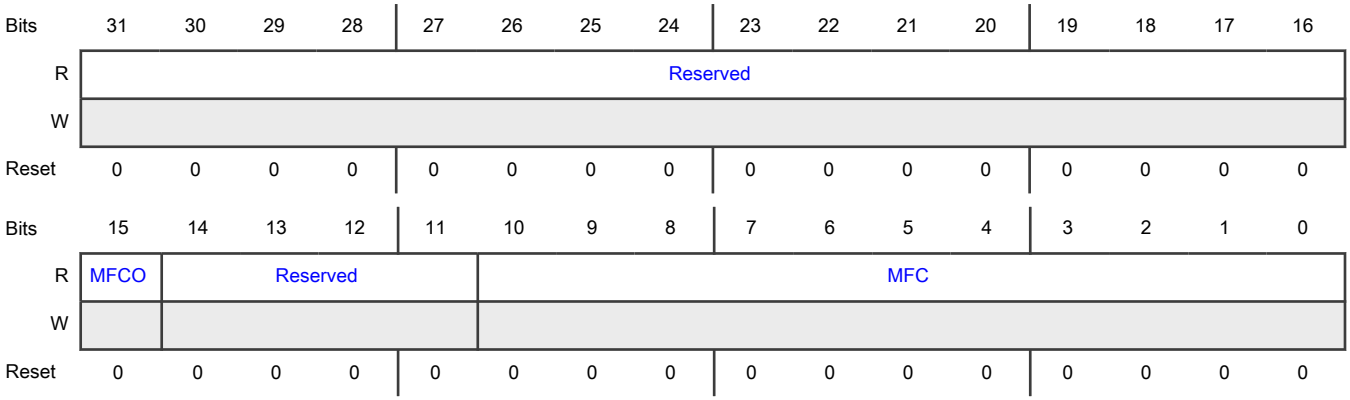
Offset

Register	Offset
DMA_CH2_Miss_Frame_Cnt	1264h

Function

This register has the number of packet counter that got dropped by the DMA either due to Bus Error or due to programming RPF field in DMA_CH${i}_Rx_Control register.

Diagram



Fields

Field	Function
31-16 —	Reserved
15 MFCO	Overflow status of the MFC Counter When this bit is set then the MFC counter does not get incremented further. The bit gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Miss Frame Counter overflow not occurred 1b - Miss Frame Counter overflow occurred
14-11 —	Reserved
10-0 MFC	Dropped Packet Counters This counter indicates the number of packet counters that are dropped by the DMA either because of bus error or because of programing RPF field in DMA_CH${i}_Rx_Control register. The counter gets cleared when this register is read. Access restriction applies. Clears on read. Self-set to 1 on internal event.

76.17.396 DMA Channel 2 Rx Parser Accept Count (DMA_CH2_RXP_Accept_Cnt)

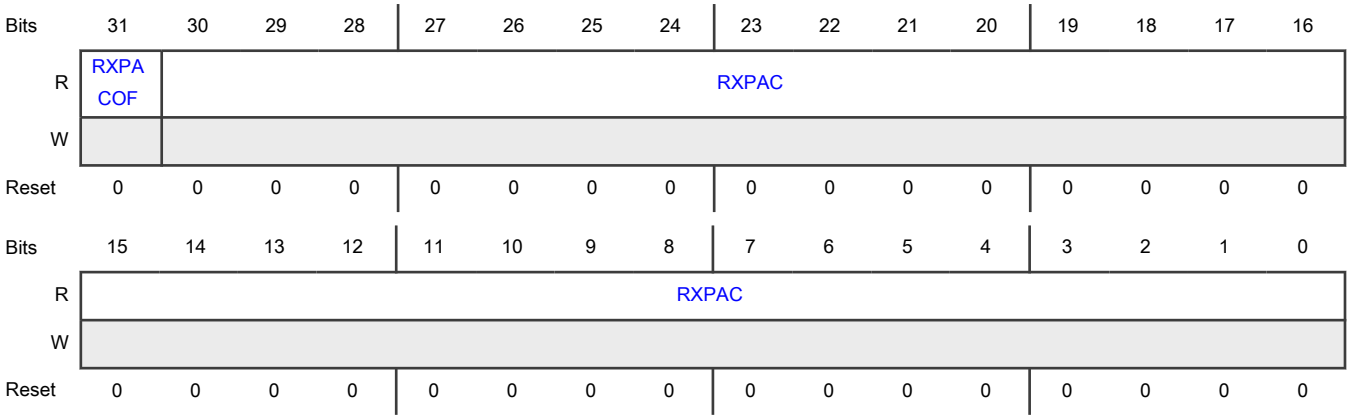
Offset

Register	Offset
DMA_CH2_RXP_Accept_Cnt	1268h

Function

The DMA_CH(#i)_RXP_Accept_Cnt registers provides the count of the number of frames accepted by Rx Parser.

Diagram



Fields

Field	Function
31 RXPACOF	Rx Parser Accept Counter Overflow Bit When set, this bit indicates that the RXPAC Counter field crossed the maximum limit. Access restriction applies. Clears on read. Self-set to 1 on internal event. 0b - Rx Parser Accept Counter overflow not occurred 1b - Rx Parser Accept Counter overflow occurred
30-0 RXPAC	Rx Parser Accept Counter This 31-bit counter is implemented when a Rx Parser Accept a packet due to AF =1. The counter is cleared when the register is read.

76.17.397 DMA Channel 2 Rx ERI Count (DMA_CH2_RX_ERI_Cnt)

Offset

Register	Offset
DMA_CH2_RX_ERI_Cnt	126Ch

Function

The DMA_CH(#i)_RX_ERI_Cnt registers provides the count of the number of times ERI was asserted.

Table 683. LPUART Configuration (continued)

Feature	Configuration	
Functionality supported	Standard LPUART functionality with MODEM/IrDA	• Standard LPUART functionality with MODEM/IrDA • MODBUS and PPROFIBUS support[1]
	LIN master and slave operation	

1. Only supported for instance LPUART_0 and LPUART_1.

NOTE

LPUART instances are not available during Standby.

LPUART[0:2]_trg_input is coming from TRGMUX and you should take care of the pulse width of trigger. It should follow the requirement mentioned in section "Peripheral Triggers". These triggers are not present in S32K314, S32K324, S32K344.

77.2 Overview

LPUART provides asynchronous, serial communication capabilities with external devices. It supports the non-return-to-zero (NRZ) encoding format and infrared data association (IrDA)-compatible, low-speed serial infrared (SIR) protocol. LPUART can continue operating when the processor is in Low-Power mode, if an appropriate peripheral clock is available.

77.2.1 Block diagram

Figure 487 shows the transmitter portion of LPUART.

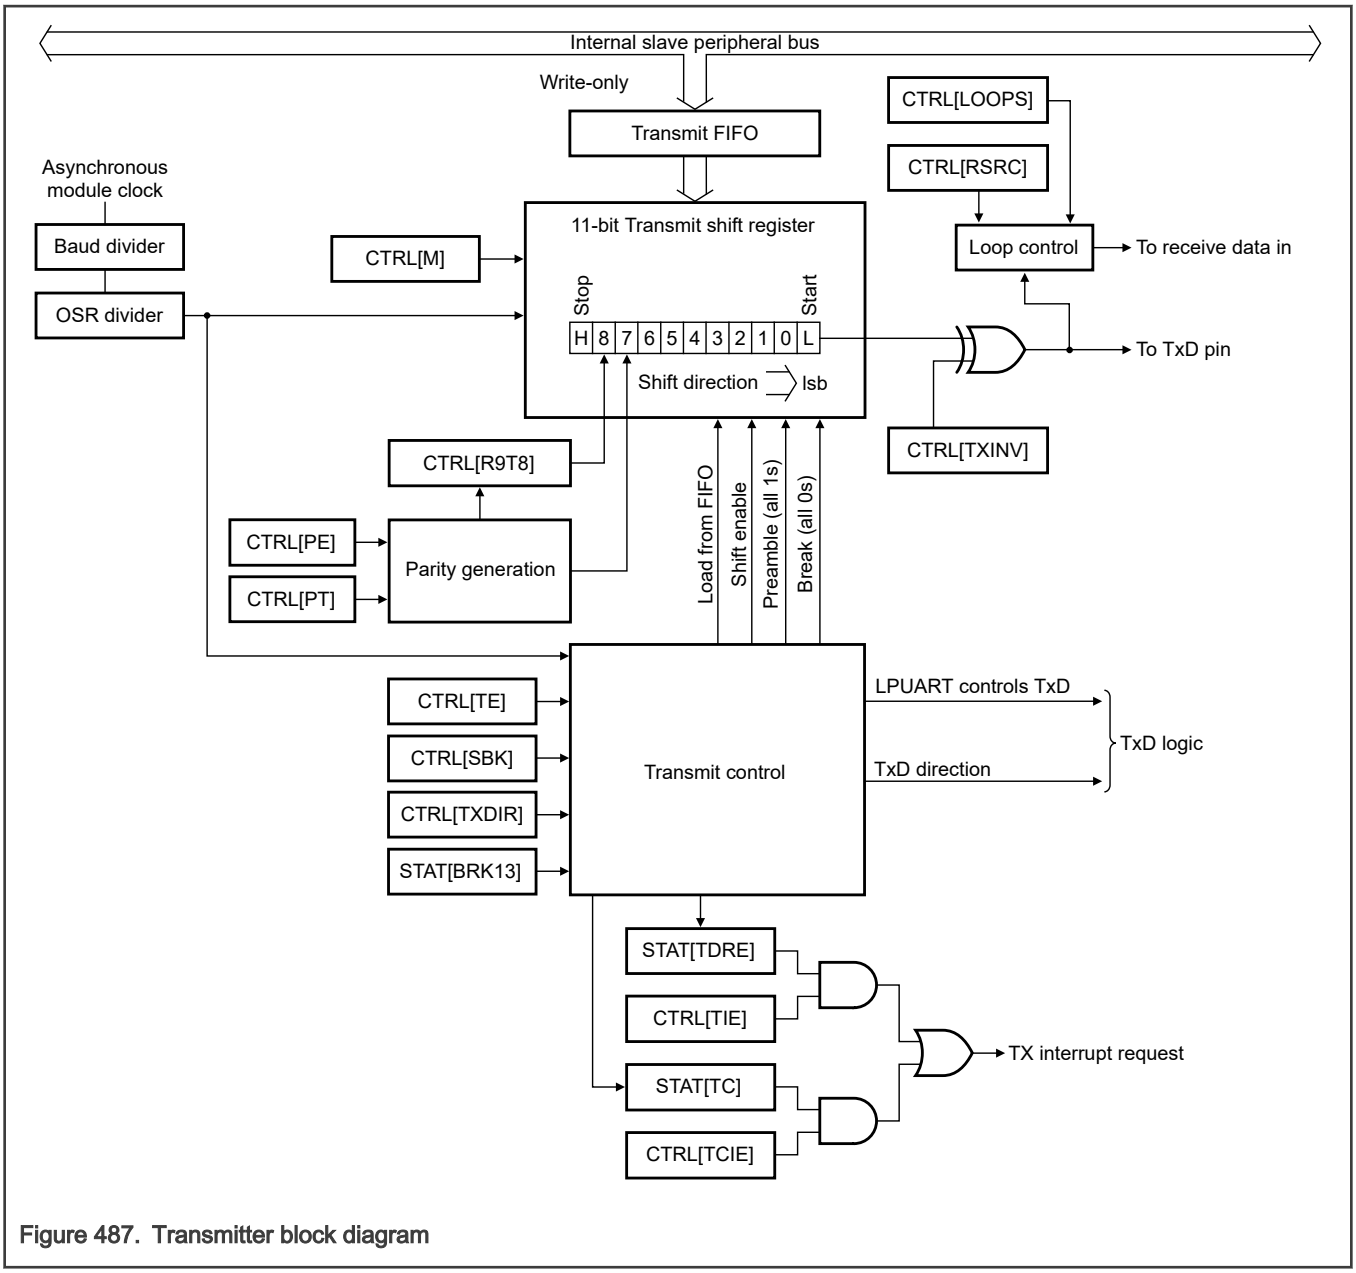

Figure 487. Transmitter block diagram

Figure 488 shows the receiver portion of LPUART.

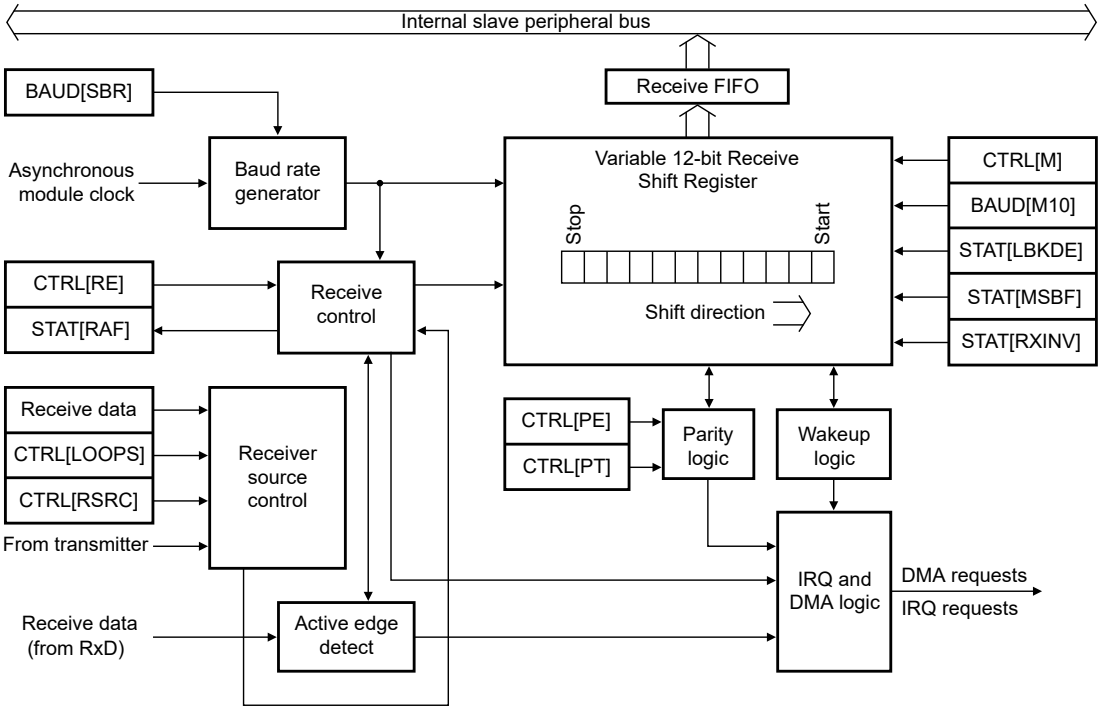

Figure 488. Receiver block diagram

77.2.2 Features

- Full-duplex, standard NRZ format
- Programmable baud rates (13-bit modulo divider) with a configurable oversampling ratio (OSR) from 4× to 32×
- Asynchronous operation of transmit and receive baud rates with respect to the bus clock:
  - Baud rate can be configured independently of the bus clock frequency.
  - Operation in Low-Power modes is supported.
- Interrupt, DMA, or polled operations:
  - Transmit data empty and transmission complete
  - Receive data full
  - Receive overrun, parity error, framing error, and noise error
  - Idle receiver detect
  - Active edge on receive pin
  - Break detect supporting LIN
  - Receive data match
- Hardware parity generation and checking
- Programmable 7-bit, 8-bit, 9-bit, or 10-bit character length
- Programmable 1-bit or 2-bit stop bits
- Support for three receiver wake-up methods:
  - Idle line wake-up

  - Address mark wake-up
  - Receive data match
- Automatic address matching to reduce ISR overhead:
  - Address mark matching
  - Idle line address matching
  - Address match start, address match end
- Optional 13-bit and 11-bit break character generation
- Configurable idle length detection supporting 1, 2, 4, 8, 16, 32, 64, or 128 idle characters
- Selectable transmitter output and receiver input polarity
- Hardware flow control support for request to send (RTS) and clear to send (CTS) signals
- Selectable IrDA 1.4 return-to-zero-inverted (RZI) format with a programmable pulse width
- Independent FIFO structure for transmit and receive functions:
  - Separate configurable watermarks for receive and transmit requests
  - Option for receiver to assert request after a configurable number of idle characters, if receive FIFO is not empty

77.3 Functional description

LPUART supports full-duplex, asynchronous, NRZ serial communication and comprises a baud rate generator, transmitter, and receiver block. The transmitter and receiver operate independently, although they use the same baud rate generator. The following sections describe all LPUART blocks.

77.3.1 Baud rate generation

A 13-bit modulus counter in the baud rate generator derives the baud rate for both the receiver and transmitter. The value, ranging from 1 to 8191, written to BAUD[SBR] determines the baud clock divisor for the asynchronous LPUART baud clock. The baud rate clock drives the receiver, while a bit clock, generated from the baud rate clock divided by the OSR, drives the transmitter. Depending on the OSR, the receiver has an acquisition rate of 4 to 32 samples per bit time.

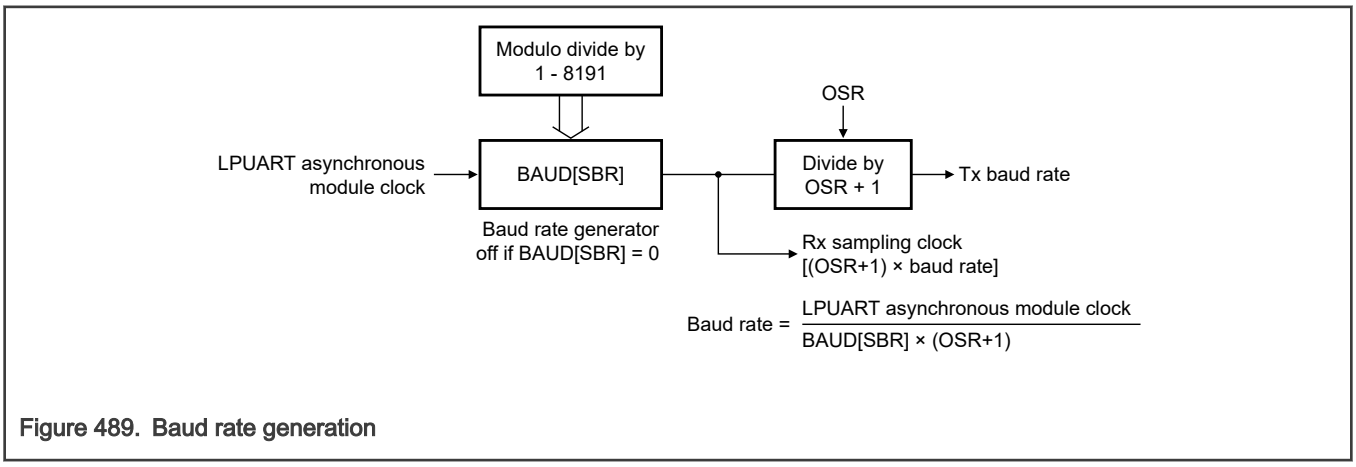

Figure 489. Baud rate generation

Baud rate generation is subject to these sources of error:

- Integer division of the asynchronous LPUART baud clock may not give the exact target frequency.
- Synchronization with the asynchronous LPUART baud clock can lead to a phase shift.

Baud rate generation is a free-running counter that continues whenever the transmitter or receiver is enabled. The transmitter bit clock continues whenever the transmitter is enabled; each transmitted character aligns to the next edge of the transmit bit clock.

In general, configuring OSR for a higher ratio and/or sampling on both edges of the clock slightly improves LPUART's tolerance to baud rate mismatch between the received data and LPUART configured baud rate. However, the three data samples in each bit (see Data sampling technique) are also closer together, which may impact noise sensitivity.

77.3.2 Baud rate tolerance

A transmitting device may operate at a baud rate below or above that of the receiver.

Accumulated bit time misalignment can cause one of the three stop bit data samples to fall outside the actual stop bit. A noise error will occur if the three samples are not all the same logical values. A framing error will occur if the receiver clock is misaligned in such a way that the majority of the three stop bit samples are a logic zero.

As the receiver samples an incoming frame, it may re-synchronize the oversampling clock on any valid falling edge within the frame. Resynchronization within frames will correct a misalignment between transmitter bit times and receiver bit times.

In general, increasing the number of samples per bit will increase the baud rate tolerance and decreasing the number of samples per bit will reduce the baud rate tolerance. Note that since LPUART implements triple voting on consecutive receive data samples, increasing the number of samples per bit will move those samples closer together which would reduce the width of noise that can be filtered by the triple voting logic.

77.3.3 Calculating baud rate tolerance

Using the following definitions:

- SAM is the number of sample points per bit (valid range from 8 to 32; equal to (OSR + 1) × (BOTHEDGE + 1)).
- BIT is the number of bits in a character including start, data and stop bits (valid range from 9 to 13).

The ideal baud rate tolerance can be calculated as follows:

- Slow data rate tolerance = ((SAM ÷ 2) - 1) ÷ ((SAM × BIT) - (SAM ÷ 2) + 2)
- Fast data rate tolerance = ((SAM ÷ 2) - 2) ÷ (SAM × BIT)

As an example, if configured for 8-bit data, 1 stop bit (BIT = 10) and with OSR=0x7 and BOTHEDGE = 1 (SAM = 16):

- Slow data rate tolerance = (8 - 1) ÷ (160 - 8 + 2) = 7 ÷ 154 = 4.54%
- Fast data rate tolerance = (8 - 2) ÷ 160 = 6 ÷ 160 = 3.75%

If configured for 9-bit data with 1 stop bit (BIT = 11) with same oversampling configuration, then:

- Slow data rate tolerance = (8 - 1) ÷ (176 - 8 + 2) = 7 ÷ 170 = 4.12%
- Fast data rate tolerance = (8 - 2) ÷ 176 = 6 ÷ 176 = 3.41%

NOTE

Additional factors can contribute to a lower baud rate tolerance than the ideal. These include clock uncertainty or jitter on the LPUART functional clock source, differences in rise and fall times on the transmitter output and synchronization of the external receive pin to the local LPUART functional clock.

77.3.4 Transmitter functional description

This section describes the functioning of the LPUART transmitter, as shown in the transmitter portion of Block diagram, as well as specialized functions for sending break and idle characters.

The transmitter output (TXD) idle state defaults to logic high; the transmitter output is inverted when you write 1 to CTRL[TXINV], which becomes 0 following reset. You can enable the transmitter by writing 1 to CTRL[TE]. This queues a preamble character that is one full character frame of the Idle state. The transmitter then remains idle until data is available in the transmit FIFO and programs store data in the transmit FIFO by writing to Data (DATA).

The central element of the LPUART transmitter is the transmit shift register that is 9-bit to 13-bit long depending on the settings of CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS]. Going forward in this discussion, assume that CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS] are 0, selecting the normal 8-bit Data mode, in which the shift register holds a start bit, eight data

bits, and a stop bit. When the transmit shift register is available for a new character, the value waiting in transmit FIFO is transferred to the transmit shift register, synchronized with the baud rate clock, and STAT[TDRE] becomes 1 to indicate that another character may be written to the transmit FIFO at Data (DATA).

If no new character is waiting in the transmit FIFO after a stop bit is shifted out of the TXD pin, the transmitter sets the transmit complete flag and enters an idle mode, with TXD high, waiting for more characters to transmit.

Writing 0 to CTRL[TE] does not immediately disable the transmitter. The current transmit activity in progress must first be completed (that could include a data character, idle character, or break character), although the transmitter does not start transmitting another character.

77.3.4.1 Break character length

CTRL[SBK] sends break characters, originally used to gain the attention of old teletype receivers. Break characters are a full character time of logic 0, 9-bit to 12-bit times, including the start and stop bits. You can enable a longer break of 13-bit times by writing 1 to STAT[BRK13]. Normally, a program waits for STAT[TDRE] to become 1 to indicate that the last character of a message has moved to the transmit shifter. Next, the program writes 1 and then writes 0 to CTRL[SBK]. This action queues a break character to be sent as soon as the shifter is available. If CTRL[SBK] remains 1 when the queued break moves into the shifter, synchronized with the baud rate clock, an additional break character is queued. When LPUART is the receiving module, it receives a break character as 0s in all data bits and a framing error (STAT[FE] = 1) is detected.

You can also transmit a break character by writing to Data (DATA) with DATA[FRETSC] = 1 and the data bits clear. This supports transmitting the break character as part of the normal data stream and also allows DMA to transmit a break character.

When idle line wake-up is used, a full character time of idle (logic 1) is needed between messages to wake up any sleeping receivers. Normally, a program waits for STAT[TDRE] to become 1 to indicate that the last character of a message has moved to the transmit shifter. Next, write 0 and then write 1 to CTRL[TE]. This action queues an idle character to be sent as soon as the shifter is available. As long as the character in the shifter does not finish while CTRL[TE] becomes 0, the LPUART transmitter does not release control of the TXD pin.

You can also write to Data (DATA) to transmit an idle character, with DATA[FRETSC] and DATA[R9T9] = 1 and the values of all the other fields = 0. This supports transmitting the idle character as part of the normal data stream and also allows DMA to transmit an idle character.

As shown in the following table, STAT[BRK13], CTRL[M], CTRL[M7], BAUD[M10], and BAUD[SBNS] affect the length of the break character.

Table 684. Break character length

STAT[BRK13]	CTRL[M]	BAUD[M10]	CTRL[M7]	BAUD[SBNS]	Break character length (in bit times)
0	0	0	0	0	10
0	0	0	0	1	11
0	0	0	1	0	9
0	0	0	1	1	10

1	1	0	—	1	14
1	—	1	—	0	15
1	—	1	—	1	15

77.3.4.2 Hardware flow control

The transmitter supports hardware flow control by gating the transmission with the value of CTS_B. If the CTS operation is enabled, the character is transmitted when CTS_B is asserted. If CTS_B is deasserted in the middle of a transmission with characters remaining in the transmitter FIFO, the character in the transmit shift register is complete. Any characters in the FIFO wait for CTS_B to assert again, and TXD remains in the mark state (idle state) until CTS_B is reasserted. The CTS_B pin must assert for longer than one bit period to guarantee that a new transmission is started when the transmitter is idle with CTS.

If the CTS operation is disabled, the transmitter ignores the state of CTS_B.

The transmitter's CTS_B signal can be enabled even if the same LPUART receiver's RTS_B signal is disabled.

77.3.4.3 Transceiver driver enable

The transmitter can use RTS_B as an enable signal for the driver of an external transceiver. See Transceiver driver enable using RTS_B for details. If the RTS operation is enabled, when a character is placed into an empty transmit shift register, RTS_B asserts 1-bit time before the start bit is transmitted. RTS_B remains asserted for the whole time that the transmit shift register has any characters. RTS_B deasserts 1-bit time after all characters in the transmit FIFO and shift register are completely sent, including the last stop bit. In other words, when RTS_B is used as a transceiver enable, RTS_B asserts 1-bit time before the transmitter starts transmitting and negates 1-bit time after the transmitter goes idle.

Transmitting a break character also asserts RTS_B, with the same assertion and deassertion timing as having a character in the transmit shift register.

The transmitter's RTS_B signal asserts only when the transmitter is enabled. However, the transmitter's RTS_B signal is unaffected by its CTS_B signal. RTS_B remains asserted until the transfer is complete, even if the transmitter is disabled mid-way through a data transfer.

You can configure HDCR[RTSEXT] to the desired length by delaying the transmitter's RTS_B negation by up to 256-bit clock (baud rate) after the last stop bit.

77.3.4.4 Transceiver driver enable using RTS_B

RS-485 is a multiple drop communication protocol in which the LPUART transceiver's driver is three-stated unless LPUART is driving. The transmitter can use the RTS_B signal to enable the driver of a transceiver. The polarity of RTS_B can be matched to the polarity of the transceiver's driver enable signal.

The following figure shows the receiver enable signal asserted. This connection can also connect RTS_B to both DE and RE_B. The transceiver's receiver is disabled when driving. A pullup can pull RXD to a nonfloating value during this time. You can refine this option further by operating LPUART in Single-Wire mode, freeing the RXD pin for other uses.

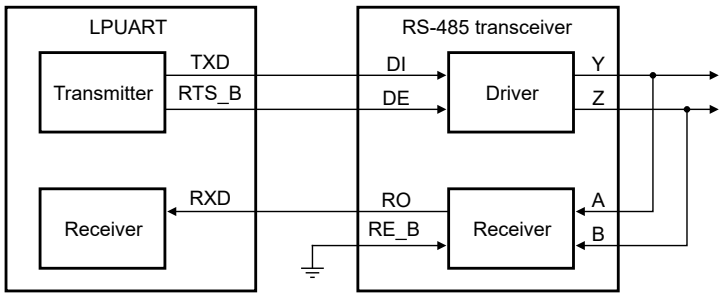

Figure 490. Transceiver driver enable using RTS_B

77.3.5 Receiver functional description

This section discusses the functioning of the LPUART receiver, as shown in the receiver portion of Block diagram. The section also discusses:

- The data sampling technique used to reconstruct receiver data.
- Different variations of the receiver wake-up function.

You can invert the receiver input by writing 1 to STAT[RXINV] and enable the receiver by writing 1 to CTRL[RE]. Character frames consist of a start bit of logic 0, along with N (7, 8, 9, 10) bits (MSB or LSB first), and one or two stop bits of logic 1. For information about 7-bit, 9-bit, or 10-bit Data mode, see Data modes. Going forward in this discussion, assume that LPUART is configured for a normal 8-bit Data mode.

After receiving the stop bit into the receive shifter, and provided the receive data register is not already full (STAT[RDRF] = 0), the data character is transferred to the receive FIFO, resulting in STAT[RDRF] becoming 1. However, if STAT[RDRF] is already 1, indicating that the receive data buffer is already full, STAT[OR] becomes 1 and the new data is lost.

Because the LPUART receiver is separate from the receive FIFO, the receive shift register can receive the next word when the receive FIFO is full, and it is only at the end of the character that the next data is written into the receive FIFO, potentially triggering the overrun flag if the FIFO is full.

When a program detects that the receive data register is full (STAT[RDRF] = 1), it gets the data from the FIFO by reading Data (DATA). See Interrupts for details about flag clearing.

77.3.5.1 Data sampling technique

The LPUART receiver supports a configurable oversampling rate of between 4× and 32× of the baud rate clock for sampling. The receiver starts by considering logic level samples at the oversampling rate times the baud rate to search for a falling edge on the RXD serial data input pin. A falling edge is defined as a logic 0 sample after three consecutive logic 1 samples. The oversampling baud rate clock divides the bit time into 4 to 32 segments from 1 to OSR (where OSR is the configured oversampling ratio). When a falling edge is located, three more samples are taken at (OSR ÷ 2), (OSR ÷ 2) + 1, and (OSR ÷ 2) + 2 to ensure that this is a real start bit and not merely noise. If at least two of these three samples are 0, the receiver assumes they are synchronized to a received character. If another falling edge is detected before the receiver is considered synchronized, the receiver restarts sampling from the first segment.

The receiver then samples each bit time, including the start and stop bits, at (OSR ÷ 2), (OSR ÷ 2) + 1, and (OSR ÷ 2) + 2, to determine the logic level for that bit. The logic level is interpreted to be that of the majority of the samples taken during the bit time. If any sample in any bit time, including the start and stop bits, in a character frame fails to agree with the logic level for that bit, noise flag (STAT[NF]) becomes 1 when the received character is transferred to the receive FIFO.

When the LPUART receiver is configured to sample on both edges of the baud rate clock (that is, when BAUD[BOTHEDGE] = 1), the number of segments in each received bit is effectively doubled (from 1 to OSR× 2). The start and data bits are then sampled at OSR, OSR + 1, and OSR + 2. You must enable sampling on both edges of the clock for oversampling rates of 4× to 7×. This sampling is optional for higher oversampling rates.

The synchronization feature of LPUART synchronizes the internal oversampling counter with a detected falling edge on the receive signal, and to adjust the data sampling window. The falling edge detection needs three consecutive 1s prior to the "1->0" (one to zero) transition. After the initial falling edge detection for the start bit, the circuit continuously monitors the next falling edge, and resets the counter after another falling edge is detected. This synchronization to the start bit is termed as resynchronizarion.

When BAUD[RESYNCDIS] is 0, you perform this falling edge detection and resynchronization not only for the start bit but also for the rest of the character reception after the start bit.

When BAUD[RESYNCDIS] is 1, you perform the falling edge detection and resynchronization only for the start bit. The use case for disabling the resynchronization is protocols that require this (for example, LIN 2.1 prohibits resynchronization within a byte).

The following table and figure explain LPUART resynchronization.

Table 685. LPUART resynchronization settings

Resynchronization	BAUD[RESYNCDIS] = 0	BAUD[RESYNCDIS] = 1
For the starting bit falling edge	Yes	Yes
For all falling edges after the start bit	Yes	No

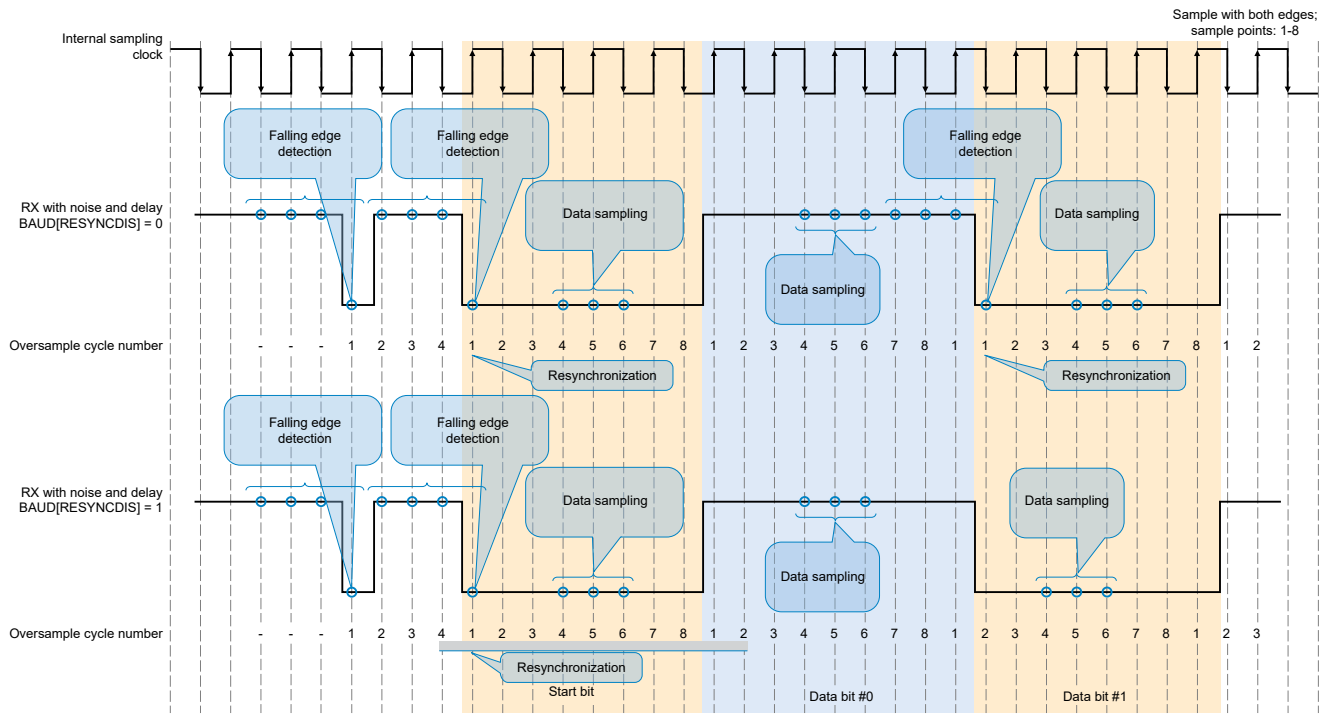

Figure 491. LPUART resynchronization diagram

77.3.5.2 Receiver wake-up operation

Receiver wake-up and receiver address matching are hardware mechanisms that allow an LPUART receiver to ignore the characters in a message intended for a different receiver.

During receiver wake-up, all receivers evaluate the first character(s) of each message, and as soon as they determine the message is intended for a different receiver, they write 1 to CTRL[RWU].

When CTRL[RWU] and STAT[RWUID] are 1, the status fields associated with the receiver, with the exception of STAT[IDLE], are inhibited from becoming 1, thus eliminating the software overhead for handling the unimportant message characters. At the end of a message, all receivers automatically force CTRL[RWU] to become 0. This results in all receivers waking up in time to look at the first character(s) of the next message.

During receiver address matching, the address matching is performed in hardware and the LPUART receiver ignores all characters that do not meet the address match requirements.

Table 686. Receiver wake-up options

CTRL[RWU]	BAUD[MAEN1] | BAUD[MAEN2]	BAUD[MATCFG]	CTRL[WAKE]: STAT[RWUID]	Receiver wake-up
0	0	X	X	Normal operation
1	0	00	00	Receiver wake-up on idle line; STAT[IDLE] = 0
1	0	00	01	Receiver wake-up on idle line; STAT[IDLE] = 1
1	0	00	10	Receiver wake-up on address mark
1	1	11	10	Receiver wake-up on data match
0	1	00	X0	Address mark address match; STAT[IDLE] = 0 for discarded characters
0	1	00	X1	Address mark address match; STAT[IDLE] = 1 for discarded characters
0	1	01	X0	Idle line address match
0	1	10	X0	Match on and match off; STAT[IDLE] = 0 for discarded characters
0	1	10	X1	Match on and match off; STAT[IDLE] = 1 for discarded characters

77.3.5.2.1 Idle line wake-up

When CTRL[WAKE] is 0, you can configure the receiver for an idle line wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a full character time of the idle-line level.

CTRL[M], CTRL[M7], and BAUD[M10] select 7-bit to 10-bit Data mode and BAUD[SBNS] selects a 1-bit or 2-bit stop bit number that determines how many bit times of idle are needed to constitute a full character time, 9 to 13 bit times because of the start and stop bits.

When CTRL[RWU] is 1 and STAT[RWUID] is 0, the idle condition that wakes up the receiver does not lead to STAT[IDLE] becoming 1. The receiver wakes up and waits for the first data character of the next message that leads to STAT[RDRF] becoming 1 and generates an interrupt if enabled. When STAT[RWUID] is 1, any idle condition leads to STAT[IDLE] becoming 1 and generates an interrupt if enabled, regardless of whether CTRL[RWU] is 0 or 1.

These are the ways to detect an idle line:

- When CTRL[ILT] is 0, the idle bit counter starts after the start bit so that the stop bit and any logic 1s at the end of a character count to calculate the full character time of idle.
- When CTRL[ILT] is 1, the idle bit counter does not start until after the stop bit time so that the data in the last character of the previous message does not impact the idle detection.

77.3.5.2.2 Address mark wake-up

When CTRL[WAKE] is 1, you can configure the receiver for an address mark wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a logic 1 in the most significant bit of the received character. When parity is enabled, the second most significant bit is used for address mark wake-up.

Address mark wake-up allows messages to contain idle characters, but requires one bit to be reserved for use in address frames. The logic 1 in the most significant bit (or second most significant bit when parity is enabled) of an address frame writes 0 to CTRL[RWU] and writes 1 to STAT[RDRF]. In this case, the character with the address mark bit is received even if the receiver is sleeping during most of this character time.

77.3.5.2.3 Data match wake-up

When CTRL[RWU] and CTRL[WAKE] are 1, and BAUD[MATCFG] equals 11, the receiver is configured for a data match wake-up. In this mode, CTRL[RWU] becomes 0 automatically when the receiver detects a character that matches MATCH[MA1] when BAUD[MAEN1] is 1, or that matches MATCH[MA2] when BAUD[MAEN2] is 1.

77.3.5.2.4 Address match operation

You can enable the address match operation when either BAUD[MAEN1] or BAUD[MAEN2] is 1 and BAUD[MATCFG] is 0. In this function, a character that the RXD pin receives with a logic 1 in the most significant bit (or the second most significant bit when parity is enabled) is considered an address and is compared to the associated MATCH[MA1] or MATCH[MA2]. The character is only transferred to the receive buffer, and STAT[RDRF] becomes 1 if the comparison matches. All subsequent characters received with a logic 0 in the most significant bit (or the second most significant bit when parity is enabled) are considered to be data associated with the address and are transferred to the receive FIFO. If no marked address match occurs, no transfer is made to the receive FIFO, and all the characters that follow, with logic 0 in the most significant bit (or second most significant bit when parity is enabled), are also discarded. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

The address match operation functions in the same way for both MATCH[MA1] and MATCH[MA2]:

- If either BAUD[MAEN1] or BAUD[MAEN2] is 1, a marked address is compared only to the associated Match Address (MATCH) and data is transferred to the receive FIFO only on a match.
- If both BAUD[MAEN1] and BAUD[MAEN2] are 1, a marked address is compared to both MATCH[MA1] and MATCH[MA2] and data is transferred only on a match with either of these fields.

77.3.5.2.5 Idle match operation

You can enable the idle match operation when either BAUD[MAEN1] or BAUD[MAEN2] is 1 and BAUD[MATCFG] is 1. In this function, the first character that the RXD pin receives after an idle line condition is considered an address and is compared to the associated MATCH[MA1] or MATCH[MA2]. The character is transferred only to the receive buffer, and STAT[RDRF] becomes 1, if the comparison matches. All subsequent characters are considered to be data associated with the address and are transferred to the receive FIFO until the next idle line condition is detected. If no address match occurs, no transfer is made to the receive FIFO, and all the frames that follow, until the next idle condition, are also discarded. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

An idle match operation functions in the same way for both MATCH[MA1] and MATCH[MA2]:

- If either BAUD[MAEN1] or BAUD[MAEN2] is 1, the first character after an idle line is compared only to the associated Data (DATA) and data is transferred to the receive FIFO only on a match.

- If both BAUD[MAEN1] and BAUD[MAEN2] are 1, the first character after an idle line is compared to both MATCH[MA1] and MATCH[MA2] and data is transferred only on a match with either of these fields.

77.3.5.2.6 Match on, match off operation

The match on, match off operation is enabled when both BAUD[MAEN1] and BAUD[MAEN2] are 1 and BAUD[MATCFG] = 10. In this function, a character that the RXD pin receives matches MATCH[MA1] and is transferred to the receive buffer, and STAT[RDRF] becomes 1. All subsequent characters are considered to be data and are also transferred to the receive FIFO, until a character that matches MATCH[MA2] is received. The character that matches MATCH[MA2], along with all subsequent characters, is discarded; and this continues until another character that matches MATCH[MA1] is received. If both BAUD[MAEN1] and BAUD[MAEN2] are 0, the receiver operates normally, and all the received data is transferred to the receive FIFO.

NOTE

The match on, match off operation requires both BAUD[MAEN1] and BAUD[MAEN2] to be 1.

77.3.5.3 Hardware flow control

To support hardware flow control, you can program the receiver to automatically assert and deassert RTS_B:

- RTS_B remains asserted until the transfer is complete, even if the transmitter is disabled midway through a data transfer. See Transceiver driver enable using RTS_B for more information.
- If the receiver RTS functionality is enabled, the receiver automatically deasserts RTS_B if STAT[RDRF] is 1 or a start bit is detected that causes STAT[RDRF] to become 1.
- The receiver asserts RTS_B when STAT[RDRF] is 0 and has not detected a start bit that causes STAT[RDRF] to become 1. There is no impact if STAT[RDRF] is 1 already.
- Even if RTS_B is deasserted, the receiver continues to receive characters until the receive FIFO is overrun.
- If the receiver RTS functionality is disabled, the receiver's RTS_B remains deasserted.

77.3.6 Additional LPUART functions

77.3.6.1 Data modes

You can configure the LPUART transmitter and receiver to operate in 7-bit Data mode by writing 1 to CTRL[M7], 9-bit Data mode by writing 1 to CTRL[M], or 10-bit Data mode by writing 1 to BAUD[M10]. In 9-bit Data mode, there exists a ninth data bit and in 10-bit mode, there exists a tenth data bit.

When performing 8-bit writes to the transmit FIFO, the ninth and tenth bits are pushed into the FIFO from CTRL[T8] and CTRL[T9]. For coherent 8-bit writes, you must write to CTRL[T8] and CTRL[T9] before writing to Data (DATA)[7:0]. However, if the values in CTRL[T8] or CTRL[T9] do not need to change, it is not necessary to update CTRL[T8] and CTRL[T9] before every 8-bit write to Data (DATA).

When performing 16-bit or 32-bit writes to the transmit FIFO, all 10 bits are pushed into the transmit FIFO from the write data.

When performing 8-bit reads of the receive FIFO, the ninth and tenth bits are held in CTRL[R8] and CTRL[R9] but you must read them before reading Data (DATA). A 16-bit or 32-bit read of the receive FIFO returns all 10 bits in Data (DATA).

The 9-bit Data mode is typically used with parity to allow eight bits of data plus the parity in the ninth bit, or it is used with the address mark wake-up so that the ninth data bit can serve as the wake-up bit. The 10-bit Data mode is typically used with parity and address mark wake-up so that the ninth data bit can serve as the wake-up bit and the tenth bit can serve as the parity bit. In custom protocols, the ninth and/or tenth bits can also serve as software-controlled markers.

77.3.6.2 Idle length

An idle character is one where the start bit, all data bits, and stop bits are in the mark position (idle state, generally logic 1). You can configure CTRL[ILT] to start detecting an idle character from the previous start bit (any data bits and stop bits count for idle character detection) or from the previous stop bit.

You can also use CTRL[IDLECFG] to configure the number of idle characters that must be received before an idle line condition is detected. This field configures the number of idle characters that must be received before STAT[IDLE] becomes 1, STAT[RAF] becomes 0, and DATA[IDLINE] becomes 1 with the next received character.

CTRL[IDLECFG] also affects the idle line wake-up and idle match operations. When either the address match or match on/off operation is enabled, writing 1 to STAT[RWUID] causes any discarded characters to be treated as idle characters.

After the extended idle time is enabled for the receiver, you can configure an idle line condition by using REIR[IDTIME], which specifies the number of bits (baud rate) since the last stop bit that is required for an idle condition to be detected. This replaces the configuration of CTRL[ILT] and CTRL[IDLECFG].

The transmitter can also enable the extended idle time. In this case, any idle character queued through the transmit FIFO forces the transmitter to be idled for the configured number of bit clocks before the idle character is read from the FIFO and the transmitter continues.

After you enable the transmitter extended idle time, the transmitter does not automatically queue an idle character whenever it is enabled.

77.3.6.3 Loop mode

Enable Loop mode by setting CTRL[LOOPS] = 1 and CTRL[RSRC] = 0. You, sometimes, use Loop mode to check software, independent of connections in the external system, to help isolate system problems. In this mode, the transmitter output is internally connected to the receiver input and LPUART does not use the RXD pin.

Loop mode also internally connects the RTS_B output to the CTS_B input and the DTR_B output to the DSR_B input.

77.3.6.4 Single-Wire mode

Enable Single-Wire mode by setting CTRL[LOOPS] = 1 and CTRL[RSRC] = 1. Single-Wire mode implements a half-duplex serial connection. The receiver is internally connected to the transmitter output and TXD pin (the RXD pin is not used).

In Single-Wire mode, CTRL[TXDIR] controls the direction of serial data on the TXD pin. When CTRL[TXDIR] becomes 0, the TXD pin is an input to the receiver and the transmitter is temporarily disconnected from the TXD pin so that an external device can send serial data to the receiver. When CTRL[TXDIR] = 1, the TXD pin is an output that the transmitter drives. The internal loop back connection is disabled, and as a result, the receiver is unable to receive characters that the transmitter sends out.

Half Duplex Control (HDCR) replaces the implementation of CTRL[LOOPS] and CTRL[RSRC], and you can use this register to configure various options for both Single-Wire and Half-Duplex operations, using independent RXD and TXD pins:

- HDCR[TXSTALL] replaces the CTRL[TXDIR] functionality and prevents the transmitter from becoming busy or asserting the RTS_B transmitter if STAT[RAF] is 1.
- You can select the TXD pin, as the source for the receiver, to configure HDCR[RXSEL] for a single-wire operation. If HDCR[RXSEL] is 1, you must configure the TXD pin for an open-drain operation.
- HDCR[RXMSK] masks the receiver input when the RTS_B transmitter is asserted (this applies even if you have not configured RTS_B as an output).
- HDCR[RXWRMSK] blocks storage of the receive data in the receive FIFO when the RTS_B transmitter is asserted. This setting does not affect the receiver idle functionality.
- HDCR[RTSEXT] delays the negation of the RTS_B transmitter by the configured number of bit clocks (baud rate).

77.3.6.5 Timeout counter

LPUART implements four general-purpose timeout counters; counters 0 and 1 are used to monitor the receiver and counters 2 and 3 are used to monitor the transmitter. When enabled, you can configure each counter to monitor one of the following conditions:

- Idle time in number of bits, starting to increment when first enabled and an idle condition is detected. The counter restarts whenever a character is received or transmitted.
- Idle time in number of bits, starting to increment after the next character is received or transmitted. The counter restarts whenever a character is received or transmitted.

- Idle time is more than the timeout interval, in number of bits, but less than the extended idle timeout. The counter restarts whenever a character is received or transmitted. You can use this to detect a gap between characters that is greater than a threshold (timeout) but less than the configured extended idle time. This configuration requires the extended idle feature for the transmitter or receiver to be enabled for a proper operation.
- Number of characters received or transmitted is equal to the configured timeout. The counter asserts at the start of the character that equals the timeout value.

The timeout counters restart counting whenever the counter is disabled and then enabled. These timeout counters are disabled when the corresponding STAT[TSF] field is 1. If the timeout enable is still set after STAT[TSF] becomes 0, the timeout counter restarts as if the counter had been disabled and then enabled. You can measure the idle time in bit times from the end of the last stop bit and until a start bit is validated.

77.3.7 Peripheral triggers

The connection of the LPUART peripheral triggers with other peripherals is chip-specific.

77.3.7.1 Output triggers

LPUART generates the following output triggers that can be connected to other peripherals on the chip:

- The transmit word trigger asserts at the end of each transmitted word and negates after 1-bit period.
- The transmit data trigger is identical to the TXD pin output, but without support for input trigger modulation.
- The receive word trigger asserts at the end of each received word that is written to the receive FIFO, for one oversampling clock period.
- The receive idle trigger asserts when STAT[IDLE] becomes 1, and negates when the next valid start bit is detected.

77.3.7.2 Input trigger

LPUART supports a peripheral input trigger that you can configure in one of the following ways:

- By enabling the CTS function: You can connect the input trigger instead of the CTS_B pin input. The input trigger must assert for longer than 1-bit clock period when the transmitter is idle, with data to send, to guarantee a new transmission.
- By making the input trigger modulate the transmit data output (trigger is logically ANDed with the TXD output): The input trigger is expected to be a free-running clock (carrier signal) that generates from a timer or PWM source with a frequency that is greater than the bit-clock frequency. The carrier signal must not toggle faster than the maximum supported bit time.
- By connecting the input trigger instead of the RXD pin input: The input trigger is expected to be generated from a receive data source, such as an analog comparator or external pin.

77.3.8 Infrared (IR) interface

LPUART provides the capability of transmitting narrow pulses to an IR LED and receiving narrow pulses, transforming them to serial bits, which are then sent to LPUART. The IrDA physical layer specification defines a half-duplex IR communication link for exchanging data. The full standard includes data rates up to 16 Mbit/s. The LPUART IrDA support is limited to SIR mode that supports data rates only between 2.4 kbit/s and 115.2 kbit/s.

LPUART has an infrared transmit encoder and a receive decoder. The infrared decoder converts the received character from the IrDA format to the NRZ format, which the receiver uses. It also has an OSR oversampling baud rate clock counter that filters noise and indicates when a 1 is received. LPUART transmits serial bits of data, which the infrared submodule encodes, to transmit a narrow pulse for every zero bit. No pulse is transmitted for every single bit. When receiving data, an IR photo diode (external to LPUART) detects the IR pulses. The IR receive decoder transforms them to CMOS levels. The infrared receive decoder then stretches the narrow pulses to get back to a serial bit stream that LPUART receives. You can invert the polarity of transmitted pulses and expected receive pulses so that a direct connection can be made to external IrDA transceiver modules that use active-high pulses.

The IR submodule receives its clock sources from LPUART. The submodule selects one of these clocks to generate either 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR narrow pulses during transmission.

77.3.8.1 Infrared transmit encoder

The infrared transmit encoder converts serial bits of data from the transmit shift register to the TXD signal. A narrow pulse is transmitted for a 0 bit and no pulse is transmitted for a 1 bit. The narrow pulse is sent at the start of the bit with a duration of 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR of a bit time. A narrow low pulse is transmitted for a 0 bit when CTRL[TXINV] is 0, while a narrow high pulse is transmitted for a 0 bit when CTRL[TXINV] is 1.

77.3.8.2 Infrared receive decoder

The infrared receive block converts data from the RXD signal to the receive shift register. A narrow pulse is expected for each 0 received and no pulse is expected for each 1 received. A narrow low pulse is expected for a 0 bit when STAT[RXINV] is 0, while a narrow high pulse is expected for a 0 bit when STAT[RXINV] is 1. This receive decoder meets the edge jitter requirement as defined by the IrDA serial infrared physical layer specification.

77.3.8.3 Start-bit detection

When STAT[RXINV] is 0, the first falling edge of the received character corresponds to the start bit. The infrared decoder resets its counter. At this time, the receiver also begins its start bit detection process. After the start bit is detected, the receiver synchronizes its bit times to this start bit time. For the rest of the character reception, the infrared decoder's counter and the receiver's bit time counter count independently of each other.

77.3.8.4 Noise filtering

The decoder ignores any rising edges detected during the first half of the infrared decoder counter, and can leave any pulses less than one oversampling baud clock as undetected. This is regardless of whether the pulse is seen in the first or second half of the count.

77.3.8.5 Low-bit detection

During the second half of the decoder count, a rising edge is decoded as 0, which is sent to the receiver. The decoder counter is also reset.

77.3.8.6 High-bit detection

At OSR oversampling baud rate clocks after the previous rising edge, if a rising edge is not seen, the decoder sends a 1 to the receiver.

If the next bit is 0, which arrives late, a low bit is detected according to Low-bit detection. The value sent to the receiver is changed from 1 to 0. Then, if a noise pulse occurs outside the receiver's bit time sampling period, the delay of a 0 is not recorded as noise.

77.3.9 MODBUS protocol

77.3.9.1 MODBUS frame structure

MODBUS is an application layer messaging protocol, positioned at level 7 of the OSI model. It provides client and server communication between devices connected on different types of buses or networks.

The MODBUS protocol defines a simple protocol data unit (PDU) independent of the underlying communication layers. The mapping of the MODBUS protocol on specific buses or network can introduce some additional fields on the application data unit (ADU).

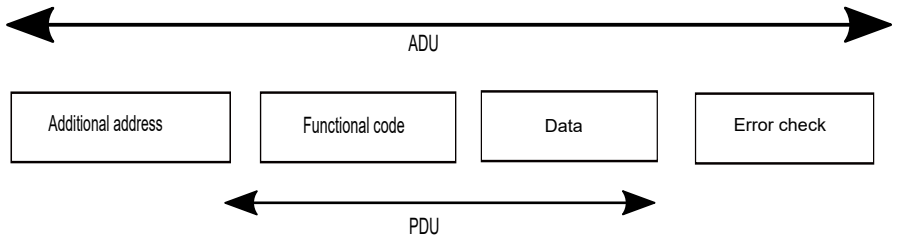

Figure 492. MODBUS frame structure

The function code field informs the server about which action to perform, as requested by the client (only the client can initiate the communication), where the data field contains additional information that the server uses to take the action defined by the function code. MODBUS PDU for serial line communication = 256 - server address (1 byte) - CRC (2 bytes) = 253 bytes.

You can set up a MODBUS controller to communicate on standard MODBUS networks using either of the two transmission modes: ASCII or RTU. RTU mode allows better character density and throughput for the same baud rate as the ASCII format allows 7 bits to represent a character where RTU keeps 8 bits for data representation in each packet.

77.3.9.2 MODBUS frame for LPUART

Though the protocol resides in the application layer, it can also be checked at the physical layer using LPUART by considering the frame structure shown in the following figure, following RTU mode of data transmission.

Start	Address	Function	Data	CRC	End
3.5 Char time	8 Bit	8 Bit	N * 8Bit	16 Bit	3.5 Char time

Figure 493. MODBUS frame for LPUART

An entire message frame of MODBUS must contain start character, address, function code, data, and end character. LPUART does not support CRC calculation for TX and RX, instead, each LPUART packet containing frame information is transmitted with its individual parity, and the same is checked in RX. Following the last transmitted character, a similar interval of at least 3.5 character times marks the end of the message and a new message can begin after this interval. The entire message frame must be transmitted as a continuous stream. If a silent interval of more than 1.5 character times occurs before the completion of the frame, the receiving device flushes the incomplete message, and assumes that the next byte is the address field of a new message. The correctness of timeout logic ensures the correctness of the MODBUS frame using LPUART.

Registers such as REIR, TEIR, TOCR, TOSR, TIMEOUT[0 - 3], TCBR, and TDBR are useful for realizing MODBUS using LPUART. The TX IDLE time is configured by using TEIR[IDTIME].

For higher baud rates, MODBUS recommends adopting fixed t1.5 and t3.5 times of 750us ms and 1.75 ms. The receiver idle line wake-up can be used by a MODBUS device to only wake-up on a matching address or broadcast address received after a valid idle time. The receiver end-of-packet DMA transfer can be used to offload the reception of a MODBUS packet onto the DMA controller.

77.3.9.3 MODBUS TX and RX programming sequence

The following programming sequences can be useful for sending and receiving MODBUS frames using LPUART.

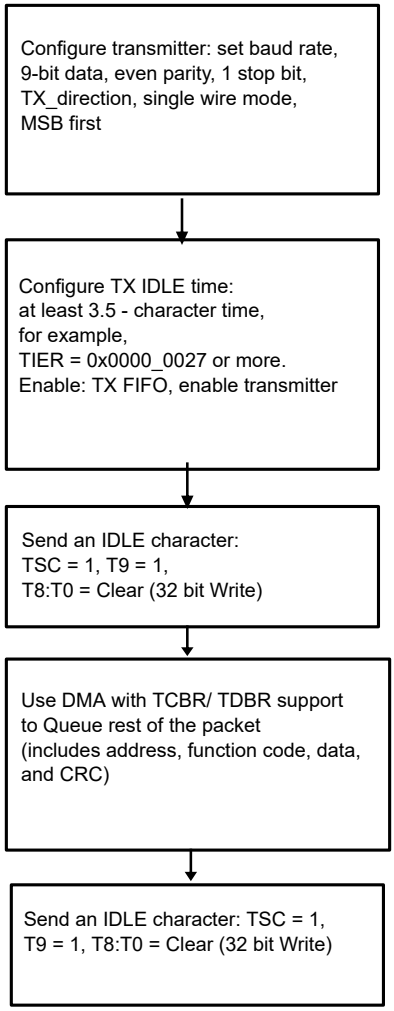

Figure 494. MODBUS TX programming

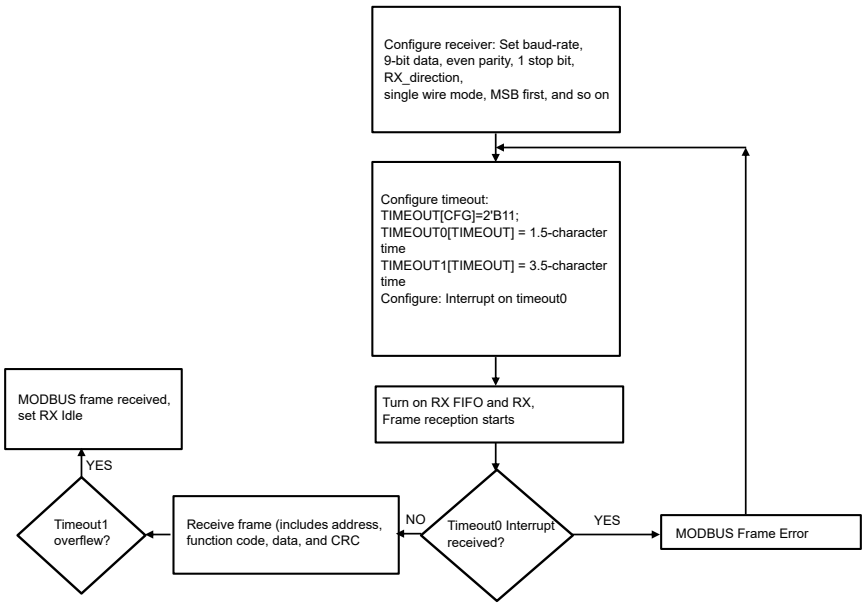

Figure 495. MODBUS RX programming

77.3.10 Modes of operation

77.3.10.1 Low-Power modes

NOTE

See the chip-specific information for specific low-power modes available on your chip.

77.3.10.2 Debug mode

LPUART remains functional in Debug mode.

77.3.11 Clocking

Table 687. Types of clocks

Clock	Description
Functional	Is asynchronous to the bus clock and can remain enabled in Low-Power modes to support transmit and/or receive functions, including low-power wake-up.
Bus	Is only used for bus accesses to the control and configuration registers. The bus clock frequency must be sufficient to support the data bandwidth requirements of the LPUART transmit and receive registers, including the FIFOs.

77.3.12 Reset

Table 688. Types of resets

Reset	Description
Chip	Enables the logic and registers for the LPUART transmitter and receiver to reset to their default states.

Table continues on the next page...

Table 688. Types of resets (continued)

Reset	Description
Software	Resets the LPUART logic and registers to their default states, except for Global (GLOBAL). GLOBAL[RST] controls the LPUART software reset.
FIFO	Implements write-only control fields that reset the transmit FIFO (FIFO[TXFLUSH]) and receive FIFO (FIFO[RXFLUSH]). After a FIFO is reset, that FIFO becomes empty.

77.3.13 Interrupts

The LPUART transmitter has two status fields that can optionally generate hardware interrupt requests. If STAT[TDRE] is 1, it indicates that there is room in the transmit FIFO to write another transmit character to Data (DATA). If CTRL[TIE] is 1, a hardware interrupt is requested when STAT[TDRE] is 1.

STAT[TC] indicates that the transmitter is finished transmitting all data, preamble, and break characters and is idle with TXD at the inactive level. This field is often used in systems with modems to determine when it is safe to turn off the modem. If CTRL[TCIE] is 1, a hardware interrupt is requested when STAT[TC] is 1. Instead of hardware interrupts, software polling may be used to monitor STAT[TDRE] and STAT[TC] if the corresponding CTRL[TIE] or CTRL[TCIE] field is 0.

When a program detects that STAT[RDRF] is 1, it gets the data from this field by reading Data (DATA). The field becomes 0 by reading Data (DATA).

STAT[IDLE] includes logic that prevents it from becoming 1 repeatedly when the RXD line remains idle for an extended period of time. STAT[IDLE] becomes 0 when you write 1 to it, and cannot become 1 again until the receiver has received at least one new character and has 1 as the value of STAT[RDRF].

If the associated error is detected in the received character that caused STAT[RDRF] to become 1, STAT[NF], STAT[FE], and STAT[PF] become 1 at the same time STAT[RDRF] becomes 1. These flags do not become 1 in overrun cases.

If STAT[RDRF] is already 1 when a new character is ready to be transferred from the receive shifter to the receive FIFO, STAT[OR] becomes 1, instead of the data along with any associated STAT[NF], STAT[FE], or STAT[PF] condition getting lost.

If the received character matches the contents of MATCH[MA1] and/or MATCH[MA2], then STAT[MA1F] and/or STAT[MA2F] become 1 at the same time that STAT[RDRF] becomes 1.

At any time, an active edge on the RXD serial data input pin causes STAT[RXEDGIF] to become 1. STAT[RXEDGIF] becomes 0 when you write 1 to it. This function depends on the receiver being enabled (the value of CTRL[RE] being 1).

MODEM Status (MSR) can generate an interrupt from a configured status field, which STAT[MSF] indicates.

Timeout Status (TOSR) can generate an interrupt from a configured status field, which STAT[TSF] indicates.

77.3.14 DMA

77.3.14.1 DMA burst support

To support efficient DMA transfers to the transmit FIFO, two alias regions are implemented to support incrementing 8-bit, 16-bit, or 32-bit write accesses to the transmit FIFO:

- Transmit Command Burst (TCBR0 - TCBR127) is a 512-byte region that supports pushing 16-bit data into the transmit FIFO.
- Transmit Data Burst (TDBR0 - TDBR255) is a 1024-byte region that supports pushing zero extended 8-bit data into the transmit FIFO.

The aforementioned regions are contiguous, so a DMA transfer can start in Transmit Command Burst (TCBR0 - TCBR127) to initialize the transfer including address mark, idle word, or break character, and then complete the transfer in Transmit Data Burst (TDBR0 - TDBR255) with the data to transmit, without changing the transfer size.

The transmit FIFO block writes overflow the FIFO, but that does not signal an error. Do not perform 32-bit writes to Transmit Data Burst (TDBR0 - TDBR255) unless there are four empty slots in the transmit FIFO, and do not perform 16-bit writes to this register unless there are two empty slots in the transmit FIFO.

77.4 External signals

Table 689. External signals

Signal	Description	I/O
TXD	Transmit data: This pin is normally an output, but is an input (tristated) in Single-Wire mode whenever the transmitter is disabled or the transmit direction is configured for receive data.	I/O
RXD	Receive data	I
CTS_B	Clear-to-send	I
RTS_B	Request-to-send	O
DTR_B	Data terminal ready	O
DSR_B	Data set ready	I
DCD_B	Data carrier detect	I
RIN_B	Ring indicator	I

77.5 Initialization

This module does not require initialization.

77.6 LPUART register descriptions

LPUART includes registers to control baud rate, select options, report status, and store transmit and receive data. Access to an address outside the valid memory map generates a bus error.

NOTE

Writing to a read-only (RO) register or reading a write-only (WO) register can cause bus errors. LPUART does not verify whether programmed values in the registers are correct; you must write valid values to them.

77.6.1 LPUART memory map

LPUART_0 base address: 4032_8000h

LPUART_1 base address: 4032_C000h

LPUART_2 base address: 4033_0000h

LPUART_3 base address: 4033_4000h

Fields

Field	Function
31 MAEN1	Match Address Mode Enable 1 Enables automatic address matching or data matching mode for MATCH[MA1]. If this field is 0, normal operation takes place. 0b - Disable 1b - Enable
30 MAEN2	Match Address Mode Enable 2

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Enables automatic address matching or data matching mode for MATCH[MA2]. If this field is 0, normal operation takes place. 0b - Disable 1b - Enable
29 M10	10-Bit Mode Select Causes the tenth bit to be a part of the serial transmission. You must change the value of this field only when both the transmitter and receiver are disabled. 0b - Receiver and transmitter use 7-bit to 9-bit data characters 1b - Receiver and transmitter use 10-bit data characters
28-24 OSR	Oversampling Ratio Configures the OSR of the receiver. You must change the value of this field only when both the transmitter and receiver are disabled. **NOTE** BAUD[OSR] results in an OSR of BAUD[OSR] + 1, for example, BAUD[OSR] = 0_0101b results in a final division by 6. 0_0000b - Results in an OSR of 16 0_0001b - Reserved 0_0010b - Reserved 0_0011b - Results in an OSR of 4 (requires BAUD[BOTHEDGE] to be 1) 0_0100b - Results in an OSR of 5 (requires BAUD[BOTHEDGE] to be 1) 0_0101b - Results in an OSR of 6 (requires BAUD[BOTHEDGE] to be 1) 0_0110b - Results in an OSR of 7 (requires BAUD[BOTHEDGE] to be 1) 0_0111b - Results in an OSR of 8 0_1000b - Results in an OSR of 9 0_1001b - Results in an OSR of 10 0_1010b - Results in an OSR of 11 0_1011b - Results in an OSR of 12 0_1100b - Results in an OSR of 13 0_1101b - Results in an OSR of 14 0_1110b - Results in an OSR of 15 0_1111b - Results in an OSR of 16 1_0000b - Results in an OSR of 17 1_0001b - Results in an OSR of 18

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1_0010b - Results in an OSR of 19 1_0011b - Results in an OSR of 20 1_0100b - Results in an OSR of 21 1_0101b - Results in an OSR of 22 1_0110b - Results in an OSR of 23 1_0111b - Results in an OSR of 24 1_1000b - Results in an OSR of 25 1_1001b - Results in an OSR of 26 1_1010b - Results in an OSR of 27 1_1011b - Results in an OSR of 28 1_1100b - Results in an OSR of 29 1_1101b - Results in an OSR of 30 1_1110b - Results in an OSR of 31 1_1111b - Results in an OSR of 32
23 TDMAE	Transmitter DMA Enable Enables STAT[TDRE] to generate a DMA request. 0b - Disable 1b - Enable
22 —	Reserved
21 RDMAE	Receiver Full DMA Enable Enables STAT[RDRF] to generate a DMA request. 0b - Disable 1b - Enable
20 —	Reserved
19-18 MATCFG	Match Configuration Configures the match addressing mode used. You must change the value of this field only when both the transmitter and receiver are disabled. 00b - Address match wake-up 01b - Idle match wake-up

Table continues on the next page...

Table continued from the previous page...

Field	Function
	10b - Match on and match off 11b - Enables RWU on data match and match on or off for the transmitter CTS input
17 BOTHEDGE	Both Edge Sampling Enables sampling of the received data on both edges of the baud rate clock, effectively doubling the number of times the receiver samples the input data for a given OSR. This field must be 1 for OSRs between x4 and x7 and is optional for higher OSRs. You must change the value of this field only when the receiver is disabled. If this field is 0, the receiver samples input data using the rising edge of the baud rate clock. If this field is 1, the receiver samples input data using the rising and falling edges of the baud rate clock. 0b - Rising edge 1b - Both rising and falling edges
16 RESYNCDIS	Resynchronization Disable Disables resynchronization of the received data word when a data one followed by data zero transition is detected. You must change the value of this field only when the receiver is disabled. 0b - Enable 1b - Disable
15 LBKDIE	LIN Break Detect Interrupt Enable Enables STAT[LBKDIF] to generate hardware interrupt requests. If this field is 0, hardware interrupts from STAT[LBKDIF] (uses polling) are disabled. If this field is 1, hardware interrupts are requested when STAT[LBKDIF] is 1. 0b - Disable 1b - Enable
14 RXEDGIE	RX Input Active Edge Interrupt Enable Enables STAT[RXEDGIF] to generate interrupt requests. If this field is 0, hardware interrupts from STAT[RXEDGIF] are disabled. If this field is 1, hardware interrupts are requested when STAT[RXEDGIF] is 1. Changing the value of CTRL[LOOPS] or CTRL[RSRC] when this field (RXEDGIE) is 1 can cause STAT[RXEDGIF] to become 1. 0b - Disable 1b - Enable
13 SBNS	Stop Bit Number Select Determines whether data characters include one or two stop bits. You must change the value of this field only when both the transmitter and receiver are disabled.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - One stop bit 1b - Two stop bits
12-0 SBR	Baud Rate Modulo Divisor Sets the modulo divide rate for the baud rate generator. • If SBR is 0, baud rate generator is disabled. • If SBR is 1–8191, baud rate = baud clock ÷ ((OSR + 1) × SBR). You must update the 13-bit baud rate setting [SBR12:SBR0] only when both the transmitter and receiver are disabled (both CTRL[RE] and CTRL[TE] are 0).

77.6.7 Status (STAT)

Offset

Register	Offset
STAT	14h

Function
Provides the module status.

Diagram

Fields

Field	Function
31 LBKDIF	LIN Break Detect Interrupt Flag Indicates whether a LIN break character is detected. This field becomes 1 when the LIN break detect circuitry is enabled and a LIN break character is detected.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE This field behaves differently for register reads and writes. When reading 0b - Not detected 1b - Detected When writing 0b - No effect 1b - Clear the flag
30 RXEDGIF	RXD Pin Active Edge Interrupt Flag Indicates whether an active edge on the receive pin has occurred. This field becomes 1 whenever the receiver is enabled and an active edge (falling if STAT[RXINV] is 0; rising if STAT[RXINV] is 1) on the RXD pin occurs. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Not occurred 1b - Occurred When writing 0b - No effect 1b - Clear the flag
29 MSBF	MSB First Specifies the first bit that is transmitted after the start bit. If this field is 0, LSB (bit 0) is the first bit transmitted after the start bit (which means, the first bit received after the start bit is identified as bit 0). If this field is 1, MSB (identified as bit 9, bit 8, bit 7, or bit 6) is the first bit that is transmitted, after the start bit, depending on the settings of CTRL[M], CTRL[PE], and BAUD[M10]. Writing 1 to this field reverses the order of the bits that are transmitted and received on the wire. This field does not affect the polarity of the bits, the location of the parity bit, or the location of the start or stop bits. You must change the value of this field only when both the transmitter and receiver are disabled. 0b - LSB 1b - MSB
28 RXINV	Receive Data Inversion Specifies whether receive data is inverted.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Writing 1 to this field reverses the polarity of the received data input. You must change the value of this field only when the receiver is disabled. **NOTE** Writing 1 to this field inverts the RXD input for all cases: data bits, start and stop bits, break, and idle. 0b - Inverted 1b - Not inverted
27 RWUID	Receive Wake Up Idle Detect Controls, for CTRL[RWU] on idle character detection, whether the idle character that wakes up the receiver writes 1 to STAT[IDLE]. For address match wake-up, this field controls whether STAT[IDLE] = 1 when the address does not match. You must change the value of this field only when the receiver is disabled. If this field is 0, during the Receive Standby state (CTRL[RWU] = 1), STAT[IDLE] does not become 1 upon detection of an idle character. During address match wake-up, STAT[IDLE] does not become 1 when an address does not match. If this field is 1, during the Receive Standby state (CTRL[RWU] = 1), STAT[IDLE] becomes 1 upon detection of an idle character. During address match wake-up, STAT[IDLE] becomes 1 when an address does not match. 0b - STAT[IDLE] does not become 1 1b - STAT[IDLE] becomes 1
26 BRK13	Break Character Generation Length Selects the longer transmitted break character length. The state of this field does not affect the detection of a framing error. You must change the value of this field only when the transmitter is disabled. You can send a break character by writing 1 to CTRL[SBK], or by writing the transmit FIFO when DATA[FRETSC] is 1 and DATA[R9T9] is 0. 0b - 9 to 13 bit times 1b - 12 to 15 bit times
25 LBKDE	LIN Break Detection Enable Enables LIN break detection. If this field is 0, LIN break detect is disabled, and only a normal break character can be detected. If this field is 1, LIN break detect is enabled and the LIN break character is detected at a length of 11 bit times (if CTRL[M] is 0), 12 bit times (if CTRL[M] is 1), or 13 bit times (if BAUD[M10] is 1). This field selects a longer break character detection length. When the field is 1, receive data is not stored in the receive FIFO.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE This field enables the LIN break detect circuit and disables writing receive data to FIFO. Therefore, it ignores all characters except a LIN break. 0b - Disable 1b - Enable
24 RAF	Receiver Active Flag Indicates whether the LPUART receiver is idle or active. This field becomes 1 when the receiver detects the beginning of a valid start bit, and the field becomes 0 automatically when the receiver detects an idle line. 0b - Idle, waiting for a start bit 1b - Receiver active (RXD pin input not idle)
23 TDRE	Transmit Data Register Empty Flag Indicates whether the transmit FIFO level is greater than, equal to, or less than the watermark. After the transmit FIFO is enabled, this field becomes 1 when the number of datawords in the transmit FIFO is equal to, or less than the number that WATER[TXWATER] indicates. To make the value of this field 0, write to it until the number of words in the transmit FIFO is greater than the number that WATER[TXWATER] indicates. After the transmit FIFO is disabled, this field becomes 1 to indicate that the FIFO level is less than the watermark. To make the value of this field 0 again, write to Data (DATA). This register is not affected by a character that is in the process of being transmitted; it is updated at the start of each transmitted character. 0b - Greater than watermark 1b - Equal to or less than watermark
22 TC	Transmission Complete Flag Indicates whether the transmitter is active. This field becomes 0 when a transmission is in progress or a preamble or break character is loaded; in other words, when the transmitter is active (sending data, a preamble, or a break). The field becomes 1 when the transmit buffer is empty and no data, preamble, or break character is being transmitted; in other words, when the transmission activity is complete. When this happens, the transmit data output signal becomes idle (logic 1). This field becomes 0 after you write to Data (DATA) to transmit new data, queuing a preamble by first writing 0 and then writing 1 to CTRL[TE], queuing a break character by writing 1 to CTRL[SBK]. 0b - Transmitter active 1b - Transmitter idle
21 RDRF	Receive Data Register Full Flag Indicates whether the receive FIFO level is less than, equal to, or greater than the watermark. This field becomes 1 when the number of datawords in the receive buffer is greater than the number that WATER[RXWATER] indicates and the receive FIFO is enabled. To write 0 to this field, read Data

Table continues on the next page...

Table continued from the previous page...

Field	Function
	(DATA) until the number of datawords in the receive FIFO is equal to, or less than the number that WATER[RXWATER] indicates. When the receive FIFO is disabled, this field (RDRF) becomes 1 if the receive buffer (Data (DATA)) is full. To make this field 0, read Data (DATA). A character that is in the process of being received does not cause a change in this field until the entire character is received. Even if this field is 1, the character continues to be received until an overrun condition occurs after the entire character is received. 0b - Equal to or less than watermark 1b - Greater than watermark
20 IDLE	Idle Line Flag Indicates whether an idle line is detected. This field becomes 1 when the LPUART receive line becomes idle for a full character time after a period of activity. When CTRL[ILT] is 0, the receiver starts counting idle bit times after the start bit. If the receive character is all 1s, these bit times and the stop bit time count towards the full character time of logic high, 10 to 13 bit times, needed for the receiver to detect an idle line. After CTRL[ILT] becomes 1, the receiver does not start counting idle bit times until after the stop bits. The stop bits and any logic high bit times at the end of the previous character do not count towards the full character time of logic high needed for the receiver to detect an idle line. For this field to become 0, write 1 to it. After the field becomes 0, you cannot write 1 to it again until after a new character is stored in the receive buffer or a LIN break character writes 1 to STAT[LBKDIF]. This field becomes 1 only once, even if the receive line remains idle for an extended period. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Idle line detected 1b - Idle line not detected When writing 0b - No effect 1b - Clear the flag
19 OR	Receiver Overrun Flag Indicates whether there is receive overrun. This field becomes 1 when you cannot prevent STAT[RDRF] from overflowing with data. The field becomes 1 immediately after the stop bit is completely received for the dataword that overflows the buffer and all the other error fields (STAT[FE], STAT[NF], and STAT[PF]) are prevented from becoming 1. The data in the shift register is lost, but the data already in the LPUART data registers is not affected. If STAT[LBKDE] is enabled and a LIN break is detected, this field becomes 1 if STAT[LBKDIF] is not 0 before the next data character is received. When this field is 1, no additional data is stored in the receive FIFO even if sufficient room exists.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE This field behaves differently for register reads and writes. When reading 0b - No overrun 1b - Receive overrun (new LPUART data is lost) When writing 0b - No effect 1b - Clear the flag
18 NF	Noise Flag Indicates whether noise is detected in the received character of Data (DATA). The advanced sampling technique used in the receiver takes three samples in each of the received bits. If some of these samples disagree with the rest of the samples within any bit time in the frame, then noise is detected for that character. This field becomes 1 whenever the next character to be read from Data (DATA) is received with noise detected within the character. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No noise detected 1b - Noise detected When writing 0b - No effect 1b - Clear the flag
17 FE	Framing Error Flag Indicates whether a framing error is detected. This field becomes 1 whenever the next character to be read from Data (DATA) is received with logic 0 detected where a stop bit was expected. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No framing error detected (this does not guarantee that the framing is correct) 1b - Framing error detected When writing 0b - No effect 1b - Clear the flag

Table continues on the next page...

Table continued from the previous page...

Field	Function
16 PF	Parity Error Flag Indicates whether a parity error is detected. This field becomes 1 whenever the next character to be read from Data (DATA) is received when parity is enabled (CTRL[PE] is 1) and the parity bit in the received character does not agree with the expected parity value. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No parity error detected 1b - Parity error detected When writing 0b - No effect 1b - Clear the flag
15 MA1F	Match 1 Flag Indicates whether the received data is equal to MATCH[MA1]. This field becomes 1 whenever the next character to be read from Data (DATA) matches the value of MATCH[MA1]. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Not equal to MA1 1b - Equal to MA1 When writing 0b - No effect 1b - Clear the flag
14 MA2F	Match 2 Flag Indicates whether the received data is equal to MATCH[MA2]. This field becomes 1 whenever the next character to be read from Data (DATA) matches the value of MATCH[MA2]. **NOTE** This field behaves differently for register reads and writes. When reading 0b - Not equal to MA2

7-2 — 	Reserved
1 AME	Address Mark Enable Configures the location of the address mark when configured for MSB first transfers. This field has no effect when configured for LSB first and you must change the value of this field only when both the transmitter and receiver are disabled. If this field is 0, address mark in character is MSB. If this field is 1, the address mark is stored in Data (DATA) at MSB (or MSB-1 when the parity bit is enabled). In other words, the address mark in character is the last bit before the stop bit (or parity bit when enabled). 0b - Disable 1b - Enable
0 LBKFE	LIN Break Flag Enable Enables the LIN break flag to assert whenever a LIN break character is detected. Unlike STAT[LBKDE], this does not impact data being stored in the receive data buffer, but does cause STAT[LBKDIF] to become 1 whenever a LIN break is detected. Because a LIN break is longer than a normal character, the LIN break triggers a write to STAT[RDRF] with the data fields as 0 and STAT[FE] as 1. The character following the LIN break has DATA[LINBRK] as 1 to indicate that the previous character was a LIN break. You must change the value of this field only when both the transmitter and receiver are disabled. If this field is 1, the LIN break character is detected at a length of 11-bit times (if CTRL[M] is 0), 12 (if CTRL[M] is 1), or 13 (if BAUD[M10] is 1). 0b - Disable 1b - Enable

77.6.8 Control (CTRL)

Offset

Register	Offset
CTRL	18h

Function

Controls various optional features of the LPUART system.

You must write to the fields of this register only when both the transmitter and receiver are disabled.

Diagram

Fields

Field	Function
31 R8T9	Receive Bit 8 Transmit Bit 9 Contains R8 and T9 that correspond to different functions. R8 is the ninth data bit received after you configure LPUART for 9-bit or 10-bit data formats. When reading 9-bit or 10-bit data, read R8 before reading Data (DATA). T9 is the tenth data bit transmitted after you configure LPUART for 10-bit data formats. When writing 10-bit data, write T9 before writing to Data (DATA). If T9 does not need to change from its previous value, such as when it is used to generate address mark or parity, then you need not write to it each time you write to Data (DATA). **NOTE** R8 is a read-only bit and T9 is a write-only bit; the value read is different from the value written.
30 R9T8	Receive Bit 9 Transmit Bit 8 Contains R9 and T8 that correspond to different functions. R9 is the tenth data bit received after you configure LPUART for 10-bit data formats. When reading 10-bit data, read R9 before reading Data (DATA). T8 is the ninth data bit transmitted after you configure LPUART for 9-bit or 10-bit data formats. When writing 9-bit or 10-bit data, write T8 before writing to Data (DATA). If T8 does not need to change from its previous value, such as when it is used to generate address mark or parity, then you need not write to it each time you write to Data (DATA). **NOTE** R9 is a read-only field and T8 is a write-only field; the value read is different from the value written.

Table continues on the next page...

Table continued from the previous page...

Field	Function
29 TXDIR	TXD Pin Direction in Single-Wire Mode Determines the direction of data at the TXD pin, in Single-Wire mode, when LPUART is configured for a single-wire half-duplex operation (CTRL[LOOPS] and CTRL[RSRC] are 1). When writing 0 to this field, the transmitter finishes transmitting the current character (if any) before the receiver starts receiving data from the TXD pin. 0b - Input 1b - Output
28 TXINV	Transmit Data Inversion Specifies whether transmit data is inverted. Writing 1 to this field reverses the polarity of the transmitted data output. This action inverts the TXD output for all cases: data bits, start and stop bits, break, and idle. 0b - Not inverted 1b - Inverted
27 ORIE	Overrun Interrupt Enable Enables STAT[OR] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when OR interrupts are disabled. 0b - Disable 1b - Enable
26 NEIE	Noise Error Interrupt Enable Enables STAT[NF] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when NF interrupts are disabled. 0b - Disable 1b - Enable
25 FEIE	Framing Error Interrupt Enable Enables STAT[FE] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when FE interrupts are disabled. 0b - Disable 1b - Enable
24 PEIE	Parity Error Interrupt Enable Enables STAT[PF] to generate hardware interrupt requests. When this field is 1, a hardware interrupt is requested. Use polling when PF interrupts are disabled. 0b - Disable 1b - Enable
23	Transmit Interrupt Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
TIE	Enables STAT[TDRE] to generate interrupt requests if STAT[TDRE] is 1. 0b - Disable 1b - Enable
22 TCIE	Transmission Complete Interrupt Enable Enables STAT[TC] to generate interrupt requests if STAT[TC] is 1. 0b - Disable 1b - Enable
21 RIE	Receiver Interrupt Enable Enables STAT[RDRF] to generate hardware interrupt requests if STAT[RDRF] is 1. 0b - Disable 1b - Enable
20 ILIE	Idle Line Interrupt Enable Enables hardware interrupts. This field enables STAT[IDLE] to generate interrupt requests. If this field is 0, hardware interrupts from STAT[IDLE] are disabled and polling is used, and if this field is 1, hardware interrupts are enabled when STAT[IDLE] is 1. 0b - Disable 1b - Enable
19 TE	Transmitter Enable Enables the LPUART transmitter. Using this field, you can also queue an idle preamble by first writing 0 and then writing 1 to this field. After this field becomes 0, the field reads 1 until the transmitter has completed the current character and the TXD pin is tristated. You can also queue a single idle character by writing to the transmit FIFO with DATA[FRETSC] and DATA[R9T9] = 1. 0b - Disable 1b - Enable
18 RE	Receiver Enable Enables the LPUART receiver. After you write 0 to this field, this field remains 1 until the receiver finishes receiving the current character (if any). 0b - Disable 1b - Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
17 RWU	Receiver Wake-Up Control Specifies whether the LPUART receiver in standby is waiting for a wake-up condition. You can write 1 to this field to place the LPUART receiver in a Standby state. The field becomes 0 automatically when an RWU event occurs, that is, in case of an idle event when CTRL[WAKE] is 0 or an address match when CTRL[WAKE] is 1 and STAT[RWUID] is 0. **NOTE** You must write 1 to this field only when CTRL[WAKE] is 0 (wake-up on idle), if the channel is currently not idle. You can determine this by the value of STAT[RAF]. If the field is 1 to wake up an idle event and the channel is already idle, LPUART, possibly, discards the data. This is because the data must be received or a LIN break is detected after an Idle condition is detected before the IDLE flag is allowed to be reasserted. 0b - Normal receiver operation 1b - LPUART receiver in standby, waiting for a wake-up condition
16 SBK	Send Break Specifies whether queue break character(s) are to be sent. Writing 1 and then 0 to this field queues a break character in the transmit data stream. Additional break characters of 9 to 13 bits, or 12 to 15 bits if STAT[BRK13] is 1, and bit times of logic 0 are queued as long as this field is 1. Depending on the timing when this field is 1 and 0, relative to the character currently being transmitted, a second break character may be queued before you write 0 to this field. If the time taken to write 0 to this field is too long, for example, if the field does not become 0 by the end of the first break character, a second break character is sent. This is compared to queuing a break character through the transmit FIFO that guarantees only one break character is sent. You can also queue a single break character by writing to the transmit FIFO when DATA[FRETSC] is 1 and DATA[R9T9] is 0. 0b - Normal transmitter operation 1b - Queue break character(s) to be sent
15 MA1IE	Match 1 (MA1F) Interrupt Enable Enables the MA1F interrupt. 0b - Disable 1b - Enable
14 MA2IE	Match 2 (MA2F) Interrupt Enable Enables the MA2F interrupt. 0b - Disable 1b - Enable
13 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
12 —	Reserved
11 M7	7-Bit Mode Select Specifies the data characters that the receiver and transmitter use. You must change the value of this field only after both the transmitter and receiver are disabled. 0b - 8-bit to 10-bit 1b - 7-bit
10-8 IDLECFG	Idle Configuration Configures the number of idle characters that must be received before you write 1 to STAT[IDLE]. 000b - 1 001b - 2 010b - 4 011b - 8 100b - 16 101b - 32 110b - 64 111b - 128
7 LOOPS	Loop Mode Select Selects Loop mode. After this field becomes 1, the RXD pin is disconnected from LPUART and the transmitter output is internally connected to the receiver input. The transmitter and receiver must be enabled to use the loop function. In Loop mode or Single-Wire mode, the transmitter outputs are internally connected to the receiver input (see CTRL[RSRC]). 0b - Normal operation: RXD and TXD use separate pins 1b - Loop mode or Single-Wire mode
6 —	Reserved
5 RSRC	Receiver Source Select Determines the source of the receiver shift register input if CTRL[LOOPS] is 1. This field has no effect unless CTRL[LOOPS] is 1. If this field is 0, internal Loopback mode is selected. LPUART does not use the RXD pin. Additionally, the CTS_B pin is not used and internally driven by the RTS_B output. If this field is 1, single-wire LPUART mode is selected where the TXD pin is connected to the transmitter output and receiver input.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Internal Loopback mode 1b - Single-wire mode
4 M	9-Bit Or 8-Bit Mode Select Specifies the data characters that the receiver and transmitter use. 0b - 8-bit 1b - 9-bit
3 WAKE	Receiver Wake-Up Method Select Determines which condition wakes up LPUART when CTRL[RWU] = 1 and BAUD[MATCFG] = 0 (this field must be 1 when BAUD[MATCFG] = 11): • Address mark in the bit preceding the stop bit (or bit preceding the parity bit when parity is enabled) of the received data character • An idle condition on the receive pin input signal If this field is 0, CTRL[RWU] is configured for idle line wake-up, and if this field is 1, CTRL[RWU] is configured with address mark wake-up. 0b - Idle 1b - Mark
2 ILT	Idle Line Type Select Determines when the receiver starts counting logic 1s as idle character bits. The count begins either after a valid start bit or the stop bit. If the count begins after the start bit, a string of logic 1s preceding the stop bit can cause false recognition of an idle character. Beginning the count after the stop bit avoids false idle character recognition, but requires properly synchronized transmissions. **NOTE** In case you write 1 to this field, a logic 0 is automatically shifted after a received stop bit, therefore resetting the idle count. 0b - After the start bit 1b - After the stop bit
1 PE	Parity Enable Enables hardware parity generation and checking. If parity is enabled, the bit immediately before the stop bit is treated as the parity bit. 0b - Disable 1b - Enable
0 PT	Parity Type Selects the type of parity, even or odd, if parity is enabled (CTRL[PE] = 1):

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• Odd parity means that the total number of logic 1 bits in the data character, including the parity bit, is odd. • Even parity means that the total number of 1s in the data character, including the parity bit, is even. 0b - Even parity 1b - Odd parity

77.6.9 Data (DATA)

Offset

Register	Offset
DATA	1Ch

Function

Supports 8-bit, 16-bit, or 32-bit writes, each type of write performing a separate function. An 8-bit write to DATA[7:0] pushes {CTRL[R8T9], CTRL[R9T8], DATA[7:0]} the transmit FIFO with TSC clear. A 16-bit or 32-bit write pushes the data written into the FIFO and does not update the value of CTRL[R8T9] or CTRL[R9T8].

Reads and writes of this register are also involved in the automatic flag clearing mechanisms for some of the LPUART status fields.

NOTE

Reads return the contents of the read-only receive FIFO and writes go to the write-only transmit FIFO, making this register work as a set of two separate registers.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	NOISY	PARITYE	FRETSC	RXEMPT	IDLINE	LINBRK	R9T9	R8T8	R7T7	R6T6	R5T5	R4T4	R3T3	R2T2	R1T1	R0T0
W																
Reset	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-16 —	Reserved
15 NOISY	Noisy Data Received Indicates whether the current received dataword contained in DATA[R9:R0] is received with noise. 0b - Received without noise 1b - Received with noise
14 PARITYE	Parity Error Indicates whether the current received dataword contained in DATA[R9:R0] is received with a parity error. 0b - Received without a parity error 1b - Received with a parity error
13 FRETSC	Frame Error Transmit Special Character Specifies the way the dataword is received. For reads, this field indicates that the current received dataword contained in DATA[R9:R0] is received with a frame error. For writes, the field indicates that a break or idle character is to be transmitted instead of the contents in DATA[T9:T0]. T9 indicates a break character when it is 0 and indicates an idle character when it is 1. The contents of DATA[T8:T0] must be 0. 0b - Received without a frame error on reads or transmits a normal character on writes 1b - Received with a frame error on reads or transmits an idle or break character on writes
12 RXEMPT	Receive Buffer Empty Indicates whether the receive buffer contains valid data. This field becomes 1 when there is no data in the receive buffer. The field does not consider data in the receive shift register. 0b - Valid data 1b - Invalid data and empty
11 IDLINE	Idle Line Indicates whether the receiver line was idle before receiving the character in DATA[9:0]. It can be read as “1” on the first character when the receiver is first enabled. The difference between this field and STAT[IDLE] is that, STAT[IDLE] flag does not set on an idle line after the receiver is first enabled, it needs to receive a character before it can become set, whereas this field does not have this limitation and can be set on the first character received if an idle line is detected beforehand. 0b - Not idle 1b - Idle
10	LIN Break

Table continues on the next page...

Table continued from the previous page...

Field	Function
LINBRK	Indicates whether the receiver line detected a LIN break before receiving the character in DATA[9:0]. This field requires the value of STAT[LBKDIF] to be 1. If this field is 0, the LIN break detect circuitry is disabled. 0b - Not detected 1b - Detected
9 R9T9	Read receive FIFO bit 9 or write transmit FIFO bit 9
8 R8T8	Read receive FIFO bit 8 or write transmit FIFO bit 8
7 R7T7	Read receive FIFO bit 7 or write transmit FIFO bit 7
6 R6T6	Read receive FIFO bit 6 or write transmit FIFO bit 6
5 R5T5	Read receive FIFO bit 5 or write transmit FIFO bit 5
4 R4T4	Read receive FIFO bit 4 or write transmit FIFO bit 4
3 R3T3	Read receive FIFO bit 3 or write transmit FIFO bit 3
2 R2T2	Read receive FIFO bit 2 or write transmit FIFO bit 2
1 R1T1	Read receive FIFO bit 1 or write transmit FIFO bit 1
0 R0T0	Read receive FIFO bit 0 or write transmit FIFO bit 0

77.6.10 Match Address (MATCH)

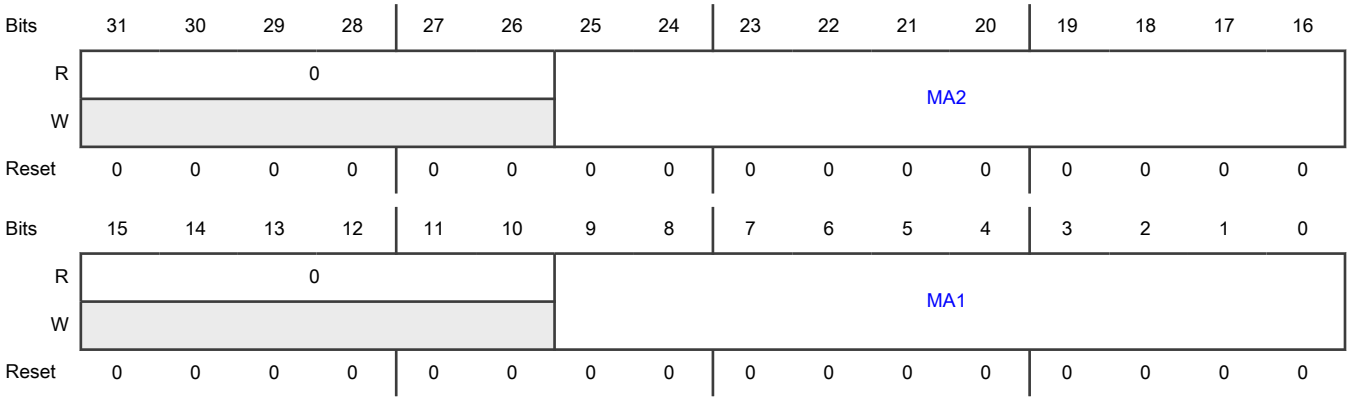
Offset

Register	Offset
MATCH	20h

Function

Provides addresses for address matching during the receiver operation.

Diagram



Fields

Field	Function
31-26 —	Reserved
25-16 MA2	Match Address 2 Is compared to input data addresses when the most significant bit is 1 and the associated Baud Rate (BAUD) field is 1. If a match occurs, the data that follows is transferred to Data (DATA). If a match fails, the data that follows is discarded. You must write to MATCH[MA1] and MATCH[MA2] only when the associated Baud Rate (BAUD) field is 0.
15-10 —	Reserved
9-0 MA1	Match Address 1 Is compared to input data addresses when the most significant bit is 1 and the associated Baud Rate (BAUD) field is 1. If a match occurs, the data that follows is transferred to Data (DATA). If a match fails, the data that follows is discarded. You must write to MATCH[MA1] and MATCH[MA2] fields only when the associated field in Baud Rate (BAUD) is 0.

77.6.11 MODEM IrDA (MODIR)

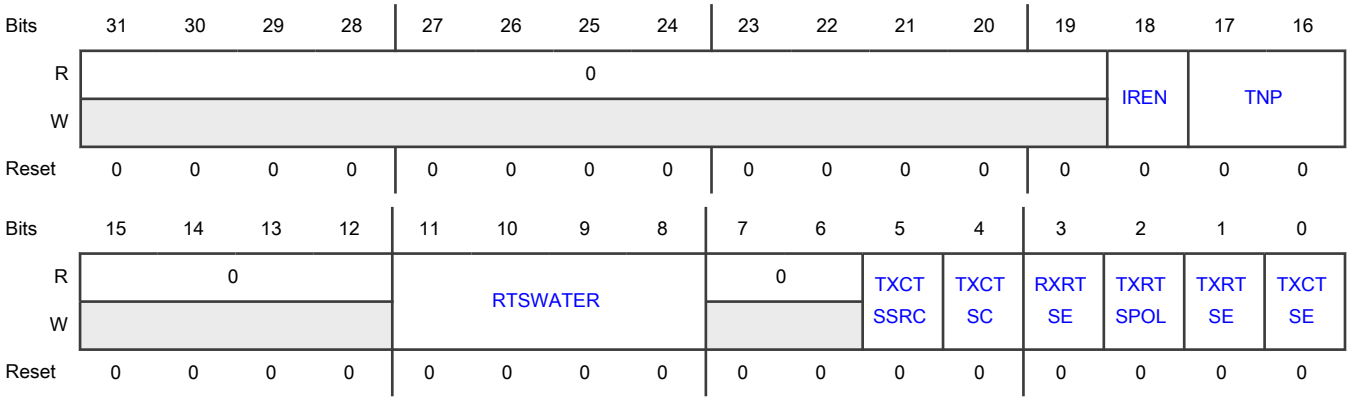
Offset

Register	Offset
MODIR	24h

Function

Controls options for setting the MODEM configuration.

Diagram



Fields

Field	Function
31-19 —	Reserved
18 IREN	IR Enable Enables IR modulation and demodulation. You must change the value of this field only when both the transmitter and receiver are disabled. 0b - Disable 1b - Enable
17-16 TNP	Transmitter Narrow Pulse Specifies whether LPUART transmits a 1 ÷ OSR, 2 ÷ OSR, 3 ÷ OSR, or 4 ÷ OSR narrow pulse when the IR pulse is enabled. You must change the value of this field only when both the transmitter and receiver are disabled. The IR pulse width must be configured to less than half of the OSR. Common pulse widths are 3 ÷ 16, 1 ÷ 16, 1 ÷ 32, or 1 ÷ 4 of the bit length. You can configure these by selecting the appropriate OSR and pulse width. 00b - 1 ÷ OSR 01b - 2 ÷ OSR 10b - 3 ÷ OSR 11b - 4 ÷ OSR
15-12 —	Reserved
11-8	Receive RTS Configuration

Table continued from the previous page...

Field	Function
RTSWATER	Configures the assertion and negation of the receiver's RTS_B output. The receiver's RTS_B output negates when the number of empty words in the receive FIFO is greater or equal to the value of this field. If this field is 0, the RTS_B pin negates when the receive FIFO is full. For the purpose of receive RTS_B generation, the number of words in the receive FIFO updates when a start bit is detected. This supports additional latency between RTS_B negation and the external transmitter ceasing transmission. If both receive RTS_B and address or data matching is enabled, RTS_B could assert at the end of a character if there exists no match. You must change the value of this field only when the receiver is disabled. **NOTE** This field is not supported in every instance. The following table includes only supported registers.

Instance	Field supported in	Field not supported in
LPUART_0	MODIR	—
LPUART_1	MODIR	—
LPUART_2	MODIR[9–8]	MODIR[11–10]
LPUART_3	MODIR[9–8]	MODIR[11–10]
LPUART_4	MODIR[9–8]	MODIR[11–10]
LPUART_5	MODIR[9–8]	MODIR[11–10]
LPUART_6	MODIR[9–8]	MODIR[11–10]
LPUART_7	MODIR[9–8]	MODIR[11–10]
LPUART_8	MODIR[9–8]	MODIR[11–10]
LPUART_9	MODIR[9–8]	MODIR[11–10]
LPUART_10	MODIR[9–8]	MODIR[11–10]
LPUART_11	MODIR[9–8]	MODIR[11–10]
LPUART_12	MODIR[9–8]	MODIR[11–10]
LPUART_13	MODIR[9–8]	MODIR[11–10]
LPUART_14	MODIR[9–8]	MODIR[11–10]
LPUART_15	MODIR[9–8]	MODIR[11–10]

Table continues on the next page...

Table continued from the previous page...

Field	Function
7-6 —	Reserved
5 TXCTSSRC	Transmit CTS Source Configures the source of the CTS input. 0b - The CTS_B pin 1b - An internal connection to the receiver address match result
4 TXCTSC	Transmit CTS Configuration Configures whether the CTS state or input is checked or sampled at the start of each character or only when the transmitter is idle. 0b - Sampled at the start of each character 1b - Sampled when the transmitter is idle
3 RXRTSE	Receiver RTS Enable Allows the RTS output to control the CTS input of the transmitting device to prevent receiver overrun. You must change the value of this field only when the receiver is disabled. If this field is 0, the receiver has no effect on RTS. If this field is 1, RTS is deasserted if STAT[RDRF] is 1 or a start bit is detected that causes STAT[RDRF] to become 1. RTS is asserted if STAT[RDRF] is 0 and has not detected a start bit that causes STAT[RDRF] to become 1. **NOTE** Do not write 1 to both MODIR[RXRTSE] and MODIR[TXRTSE]. 0b - Disable 1b - Enable
2 TXRTSPOL	Transmitter RTS Polarity Controls the polarity of the transmitter RTS. This field does not affect the polarity of the receiver RTS that remains negated in the active-low state unless MODIR[TXRTSE] is 1. You must change the value of this field only when the transmitter is disabled. 0b - Active low 1b - Active high
1 TXRTSE	Transmitter RTS Enable Controls the operation of RTS before and after a transmission. You must change the value of this field only when the transmitter is disabled. If this field is 0, the transmitter has no effect on RTS, and if this field is 1, a character is placed into an empty transmit shift register. RTS asserts 1-bit time before the start bit is transmitted and deasserts 1-bit time after all characters in the transmitter FIFO and shift register are completely sent, including the last stop bit.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disable 1b - Enable
0 TXCTSE	Transmitter CTS Enable Enables the operation of the transmitter. You can write 1 to this field irrespective of the states of MODIR[TXRTSE] and MODIR[RXRTSE]. If this field is 1, the transmitter checks the state of the CTS signal each time it is ready to send a character. If CTS is asserted, the character is sent. If CTS is deasserted, the TXD signal remains in the mark state and transmission is delayed until CTS is asserted. Changes in CTS, when a character is being sent, do not affect its transmission. 0b - Disable 1b - Enable

77.6.12 FIFO (FIFO)

Offset

Register	Offset
FIFO	28h

Function

Provides you the ability to turn on and turn off the FIFO functionality.

This register also provides you the size of the FIFO that has been implemented. You can read this register at any time and must write to it only when CTRL[RE] and CTRL[TE] are 0 and the FIFO is empty.

Diagram

Register reset values

Register	Reset value
FIFO	LPUART_0,LPUART_1: 00C0_0033h LPUART_2–LPUART_15: 00C0_0011h

Fields

Field	Function
31-24 —	Reserved
23 TXEMPT	Transmit FIFO Or Buffer Empty Indicates whether the transmit buffer is empty. This field becomes 1 when there is no data in the transmit FIFO or buffer. The field does not consider data in the transmit shift register. 0b - Not empty 1b - Empty
22 RXEMPT	Receive FIFO Or Buffer Empty Indicates whether the receive buffer is empty. This field becomes 1 when there is no data in the receive FIFO or buffer. The field does not consider data in the receive shift register. 0b - Not empty 1b - Empty
21-18 —	Reserved
17 TXOF	Transmitter FIFO Overflow Flag Indicates whether more data has been written to the transmit FIFO than it can hold. If this field is 0, no transmit FIFO overflow has occurred since the last time the field was cleared, and if this field is 1, at least one transmit FIFO overflow has occurred since the last time the field was cleared. This field becomes 1 regardless of the value of FIFO[TXOFE]. However, an interrupt is issued to the host only if FIFO[TXOFE] is 1. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No overflow 1b - Overflow When writing

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - No effect 1b - Clear the flag
16 RXUF	Receiver FIFO Underflow Flag Indicates whether more data has been read from the receive FIFO than was present. If this field is 0, no receive FIFO underflow has occurred since the last time the field was cleared, and if this field is 1, at least one receive FIFO underflow has occurred since the last time the field was cleared. This field becomes 1 regardless of the value of FIFO[RXUFE]. However, an interrupt is issued to the host only if FIFO[RXUFE] is 1. **NOTE** This field behaves differently for register reads and writes. When reading 0b - No underflow 1b - Underflow When writing 0b - No effect 1b - Clear the flag
15 TXFLUSH	Transmit FIFO Flush Causes all data that is stored in the transmit FIFO to be flushed. If you write 0 to this field, no flush operation occurs, and if you write 1 to this field, all data in the transmit FIFO or buffer clears out. This does not affect data in the transmit shift register. 0b - No effect 1b - All data flushed out
14 RXFLUSH	Receive FIFO Flush Causes all data that is stored in the receive FIFO to be flushed. If you write 0 to this field, no flush operation occurs, and if you write 1 to this field, all data in the receive FIFO or buffer clears out. This does not affect data in the receive shift register. 0b - No effect 1b - All data flushed out
13 —	Reserved
12-10	Receiver Idle Empty Enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
RXIDEN	Enables STAT[RDRF] to become 1 when the receiver is idle for a number of idle characters and the FIFO is not empty. This feature is not supported when the receiver extended idle time is enabled. 000b - Disable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle 001b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for one character 010b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for two characters 011b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for four characters 100b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for eight characters 101b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 16 characters 110b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 32 characters 111b - Enable STAT[RDRF] to become 1 because of partially filled FIFO when the receiver is idle for 64 characters
9 TXOFE	Transmit FIFO Overflow Interrupt Enable Enables FIFO[TXOF] to generate an interrupt to the host. 0b - Disable 1b - Enable
8 RXUFE	Receive FIFO Underflow Interrupt Enable Enables FIFO[RXUF] to generate an interrupt to the host. 0b - Disable 1b - Enable
7 TXFE	Transmit FIFO Enable Enables the transmit FIFO. If this field is 0, the transmit buffer operates as a FIFO of depth equal to 1 dataword, regardless of the value in FIFO[TXFIFOSIZE]. Both CTRL[TE] and CTRL[RE] must be 0 before you change the value of this field. If this field is 1, the built-in FIFO structure for the transmit buffer is enabled. FIFO[TXFIFOSIZE] indicates the size of the FIFO structure. 0b - Disable 1b - Enable
6-4 TXFIFOSIZE	Transmit FIFO Buffer Depth Indicates the maximum number of transmit datawords (transmit FIFO buffer depth) that can be stored in the transmit buffer.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	000b - 1 001b - 4 010b - 8 011b - 16 100b - 32 101b - 64 110b - 128 111b - 256
3 RXFE	Receive FIFO Enable Enables the receive FIFO. If this field is 0, the receive buffer operates as a FIFO of depth equal to 1 dataword, regardless of the value in FIFO[RXFIFOSIZE]. Both CTRL[RE] and CTRL[TE] must be 0 before you change the value of this field. If this field is 1, the built-in FIFO structure for the receive buffer is enabled. FIFO[RXFIFOSIZE] indicates the size of the FIFO structure. 0b - Disable 1b - Enable
2-0 RXFIFOSIZE	Receive FIFO Buffer Depth Indicates the maximum number of receive datawords (receive FIFO buffer depth) that can be stored in the receive buffer before an overrun occurs. 000b - 1 001b - 4 010b - 8 011b - 16 100b - 32 101b - 64 110b - 128 111b - 256

77.6.13 Watermark (WATER)

Offset

Register	Offset
WATER	2Ch

Function

Provides the ability to set a programmable threshold for notification, or sets the programmable thresholds to indicate that transmit data can be written or receive data can be read.

You may read this register at any time but must write to it only when CTRL[TE] is 0.

Diagram

Field	Function
31-14 —	Reserved
13-0 IDTIME	Idle Time Configures the transmitter idle time in number of bits (baud rate) whenever an idle character is queued through the transmit FIFO. An idle character is not automatically queued whenever the transmitter is enabled. The minimum supported extended idle time equals one idle character. The extended idle feature is disabled when this field is 0.

77.6.19 Half Duplex Control (HDCR)

Offset

Register	Offset
HDCR	50h

Function

Provides control for half-duplex-related operations.

You can use this register instead of CTRL[LOOPS], CTRL[RSRC], and CTRL[TXDIR] functions, although you can use CTRL[LOOPS] to loop-back the transmitter outputs to the receiver.

NOTE

Each module instance supports a different number of registers.

77.6.21 Timeout Status (TOSR)

Offset

Register	Offset
TOSR	5Ch

Function

Indicates the status of the timeout logic. Timeouts 0 and 1 are used to monitor the receiver and timeouts 2 and 3 are used to monitor the transmitter.

NOTE

Each module instance supports a different number of registers.

Fields

Field	Function
31-12 —	Reserved
11-8 TOF	Timeout Flag Indicates whether the corresponding timeout occurred. The timeout counter is disabled when this field is 1. **NOTE** This field behaves differently for register reads and writes. When reading 0000b - Not occurred 0001b - Occurred When writing 0000b - No effect 0001b - Clear the flag
7-4 —	Reserved
3-0 TOZ	Timeout Zero Indicates whether the corresponding timeout counter equals 0.

77.6.22 Timeout N (TIMEOUT0 - TIMEOUT3)

Offset

Register	Offset
TIMEOUT0	60h
TIMEOUT1	64h
TIMEOUT2	68h
TIMEOUT3	6Ch

Function
Configures the corresponding timeout counter and status field. Timeouts 0 and 1 are used to monitor the receiver and timeouts 2 and 3 are used to monitor the transmitter. You must write to this register only when the corresponding timeout is disabled or when the value of the corresponding timeout field is 1.

NOTE
Each module instance supports a different number of registers.

Fields

Field	Function
31-30 CFG	Idle Configuration Configures the behavior of TIMEOUT[TIMEOUT]. 00b - Becomes 1 after timeout characters are received 01b - Becomes 1 when idle for timeout bit clocks 10b - Becomes 1 when idle for timeout bit clocks following the next character 11b - Becomes 1 when idle for at least timeout bit clocks, but a new character is detected before the extended idle timeout is reached
29-14 —	Reserved
13-0 TIMEOUT	Timeout Value Configures the timeout value.

77.6.23 Transmit Command Burst (TCBR0 - TCBR127)

Offset

For a = 0 to 127:

Register	Offset
TCBRa	200h + (a × 4h)

Function

Acts as an alias of Data (DATA), designed to support incrementing burst transfers to the transmit FIFO by a DMA controller, using aligned 8-bit, 16-bit, or 32-bit writes. The size of this register is 512 bytes:

- An aligned 32-bit write in this region pushes one entry into the transmit FIFO.
- An aligned 16-bit write in this region to TCBR*x*[15:0] pushes one entry into the transmit FIFO.
- An 8-bit write in this region to TCBR*x*[7:0] updates DATA[7:0], but does not push the data into the transmit FIFO.
- An 8-bit write in this region to TCBR*x*[15:8] pushes the data written to DATA[15:8] plus the previously written DATA[7:0] into the transmit FIFO.
- An 8-bit or 16-bit write in this region to TXBR*x*[31:16] is ignored.

NOTE

Each module instance supports a different number of registers.

77.6.24 Transmit Data Burst (TDBR0 - TDBR255)

Offset

For a = 0 to 255:

Register	Offset
TDBRa	400h + (a × 4h)

Function

Acts as an alias of Data (DATA), designed to support incrementing burst transfers to the transmit FIFO by a DMA controller using 8-bit, 16-bit, or 32-bit writes. The size of this register is 1024 bytes:

- An aligned 32-bit write in this region pushes four DATA byte entries into the transmit FIFO (DATA0 byte first). The register access is extended by three wait states.
- An aligned 16-bit write in this region to either half of a 32-bit word pushes two DATA byte entries into the transmit FIFO (DATA0 or DATA2 first). The register access is extended by one wait state.
- An 8-bit write in this region pushes one DATA byte entry into the transmit FIFO.

Byte writes to Data (DATA) use the contents of CTRL[R9T8] for the ninth data bit, CTRL[R8T9] for the tenth data bit, and zero extend DATA[FRETSC].

NOTE

Each module instance supports a different number of registers.

77.7 Glossary

Baud rate Number of bits per second that LPUART transmits or receives

Break character Break character is generated when the transmitter is holding the data line at the space level for at least one character time

Oversampling Number of times the receive circuitry samples the receive input per baud period (that is, per data bit)

Chapter 78
Quad Serial Peripheral Interface (QuadSPI) for S32K322, S32K342, S32K341, S32K314, S32K324, and S32K344

78.1 Chip-specific QuadSPI information

78.1.1 QuadSPI configuration

Table 690. QuadSPI instances

Instance	S32K322/S32K342/S32K341/S32K314/S32K324/S32K344	S32K310/S32K311/S32K312
QuadSPI	Yes	No

Table 691. QuadSPI configuration details

Configuration	S32K312/S32K322/S32K342/S32K344/ S32K324/S32K314
QuadSPI Tx FIFO size	32 words
QuadSPI Rx FIFO size	32 words
Look Up Table Size	4 words
Rx Buffer	256 Bytes

For supported data rates, see device Datasheet.

NOTE

- Boot from QuadSPI is not supported but execution from external memory is supported.
- SFP is not supported in S32K344, S32K324, S32K314, S32K342, and S32K341.
- SoC generate secure access from all CM7 core to QuadSPI.

Table 692. Features supported

Feature	S32K322/S32K342/S32K341/S32K344/S32K324/S32K314
AHB Write	No
Data learning feature	No
DLL	No
OTFAD (On-the-fly-AES-decryption engine)	No
DDR mode	No
HyperRAM	No
HyperFlash	No
External DQS (Data Strobe)	No
Boot from QuadSPI interface	No

The following block diagram depicts the QuadSPI Flash A Interface.

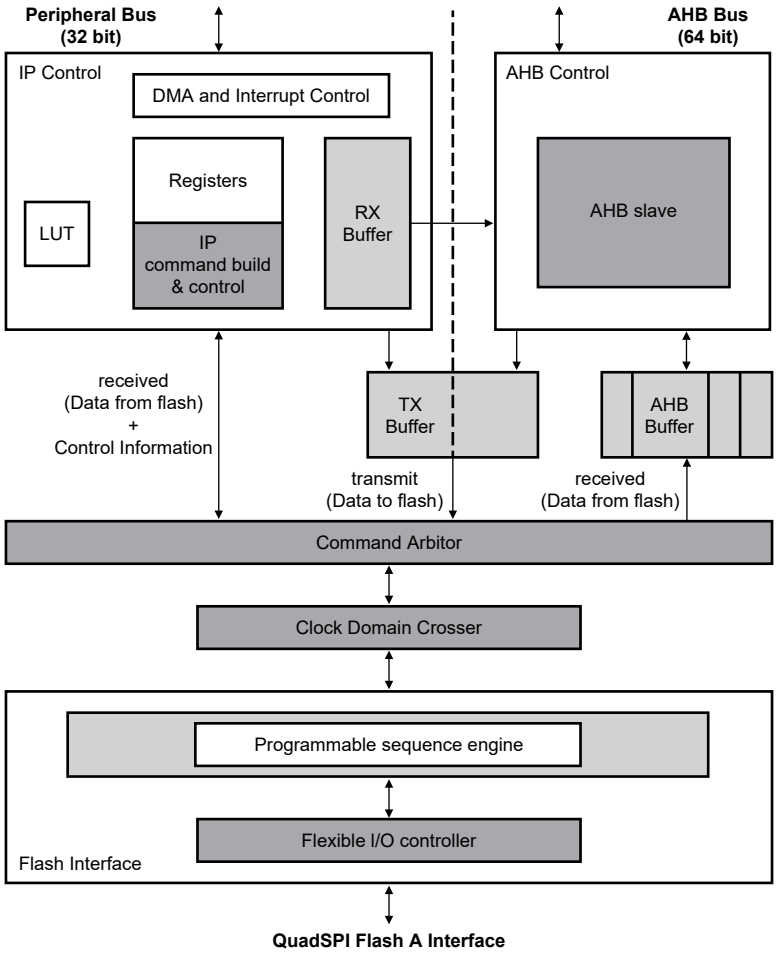

Figure 496. Block diagram

78.1.2 Supported read modes

The table below provides an overview of the QuadSPI read modes.

Table 693. QuadSPI read modes

Read modes		SDR support (QuadSPI_MCR [DDR_EN]=0)	QuadSPI_MCR [DQS_EN]	QuadSPI_MCR [DQS_FA_SEL]	Data learning support	DLL
DQS sampling method	Pad loopback	Yes	1	01	No	No

78.1.3 QuadSPI initialization sequence

Following initialization sequence should be followed for proper QuadSPI operation:

- Enable QuadSPI module by MC_ME peripheral clock enable (register PRTNx_COFBy_CLKEN present within MC_ME). Refer MC_ME chapter for peripheral mapping.
- Configure the SIUL2 registers MSCR[OBE] as 1 and MSCR[SSS] as 0 for QuadSPI_SCKFA pin.

- Initialize QuadSPI SCKFA by writing a sequence of 1010 to the SIUL2 register GPDO[PDO_a] for QuadSPI_SCKFA pin.
- Configure the SIUL2 register MSCR[OBE] back as 0 for the pins.
- Initiate a dummy flash read to reset all DQS flops by itself and any crossing from DQS domain to IPS/AHB is taken care by CDC logic.
- Initiate a peripheral software reset to QuadSPI controller by writing to QuadSPI controller's MCR.
- Post this initialization sequence, the QuadSPI will work in intended deterministic manner.

NOTE

QuadSPI initialization is to be done before using QuadSPI after each functional reset.

78.1.4 Pad clock loopback

This chip supports pad clock loopback. The QuadSPI can be configured to use clock loopback to sample input data. SCK is delayed by the SCK pin output delay, plus the SCK pin input delay using pad loopback, and is configured by setting QuadSPI config registers SOCCR[SOCCFG] and MCR[DQS_FA_SEL]. Enabling the loopback version of SCK can improve the setup time of the input data from the Flash.

For details of these register, see QuadSPI register descriptions.

78.1.5 QuadSPI SOC Configuration register SOCCR[SOCCFG] implementation

The QuadSPI SOC Configuration register QuadSPI_SOCCR[SOCCFG] register is used to control dummy loopback pads and obe_pull_timing_relax_b. Below is the description of it's bits:

Table 694. SOCCR[SOCCFG] implementation

Bit	Description
Bit[0]	obe_pull_timing_relax_b : enables the timing relaxation by pulling obe for pad 1 for half cycle, if 0 then enabled else disabled.
Bit[1]	ibe of QSPIA_SCK_DUMMY pad. 0: Disable input receiver 1: Enable input receiver.
Bit[2]	obe of QSPIA_SCK_DUMMY pad. 0: Disable output driver 1: Enable output driver.
Bit[3]	dse of QSPIA_SCK_DUMMY pad. 0: Disable drive strength 1: Enable drive strength.
Bit[4]	pue of QSPIA_SCK_DUMMY pad. 0: Disable internal pullup or pulldown resistor 1: Enable internal pullup or pulldown resistor.
Bit[5]	pus of QSPIA_SCK_DUMMYpad. 0: Enable internal pulldown resistor if pue is set 1: Enable internal pullup resistor if pue is set.
Bit[6]	sre of QSPIA_SCK_DUMMY pad. 0: Disable slew rate control 1: Enable slew rate control.
Bit[31:7]	Reserved

To Enable the Quadspi dummy PAD loopback use following settings

For Flash-A: MCR[DQS_FB_SEL] = 0x2

SOCCR[SOCCFG] = 0x0000000E (ibe=1, obe=1, dse=1 and sre=0)

NOTE

S32K3xx SoCs does not support dual die flashes. Hence, the signal PCSFA2 from QuadSPI is not used.

78.1.6 QuadSPI AHB Buffer write access control

In S32K344/S32K324/S32K314 the QuadSPI AHB buffer does not support writes. A write to QuadSPI AHB buffer results in error response from QuadSPI.

QuadSPI might behave unexpectedly in case if its AHB buffer is written with QuadSPI MCR[MDIS] =1. In cases wherein QuadSPI is disabled with above MDIS control bit, XRDC must also be appropriately configured to block the accesses to QSPI AHB buffer and indicate an error response.

78.2 Introduction

The QuadSPI module acts as an interface to a single serial flash memory device, with up to four bidirectional data lines.

78.2.1 Features

QuadSPI supports the following features:

- Flexible sequence engine to support various flash memory vendor devices. As there is no specific standard, the module supports various kinds of flash memories from different vendors. See Serial flash memory devices for example sequences.
- Single, dual, and quad modes of operation supported for Quad flash memories
- Support for HyperFlash memory
- AHB master to read RX buffer data through AMBA AHB (64-bit width interface) or IPS registers space (32-bit access) and fill TX buffer via IPS registers space (32-bit access)
  - AHB master can be a DMA with a configurable inner loop size
- Multi-master accesses are allowed
  - Flexible and configurable buffer for each master—total available buffer size is 256 bytes.
- All AHB accesses to flash/RAM memory devices are directly memory mapped to the chip system memory
- Programmable sequence engine to cater to future command/protocol changes and ability to support all existing vendor commands and operations. The software needs to select the corresponding sequence according to the connected flash memory device.
  - Support for 3-byte and 4-byte addressing

78.2.2 RX buffer push event

To add the valid entries into the RX buffer

By default, each buffer push event adds two entries to the RX buffer because the interface to the serial clock domain is 64 bits in width. Depending on the number of bytes read from the serial flash memory device, it is possible for the very last buffer push event that only one entry is added.

RBSR[RDBFL] is incremented by the number of entries added to the RX buffer.

78.2.3 RX buffer POP event

To remove valid entries from the RX buffer

Each buffer POP event removes (RBCT[WMRK] + 1) valid entries from the buffer. BSR[RDBFL] is decremented by the same number and RBSR[RDCTR] is incremented accordingly.

78.2.4 Block diagram

The following figure shows a block diagram of the QuadSPI module.

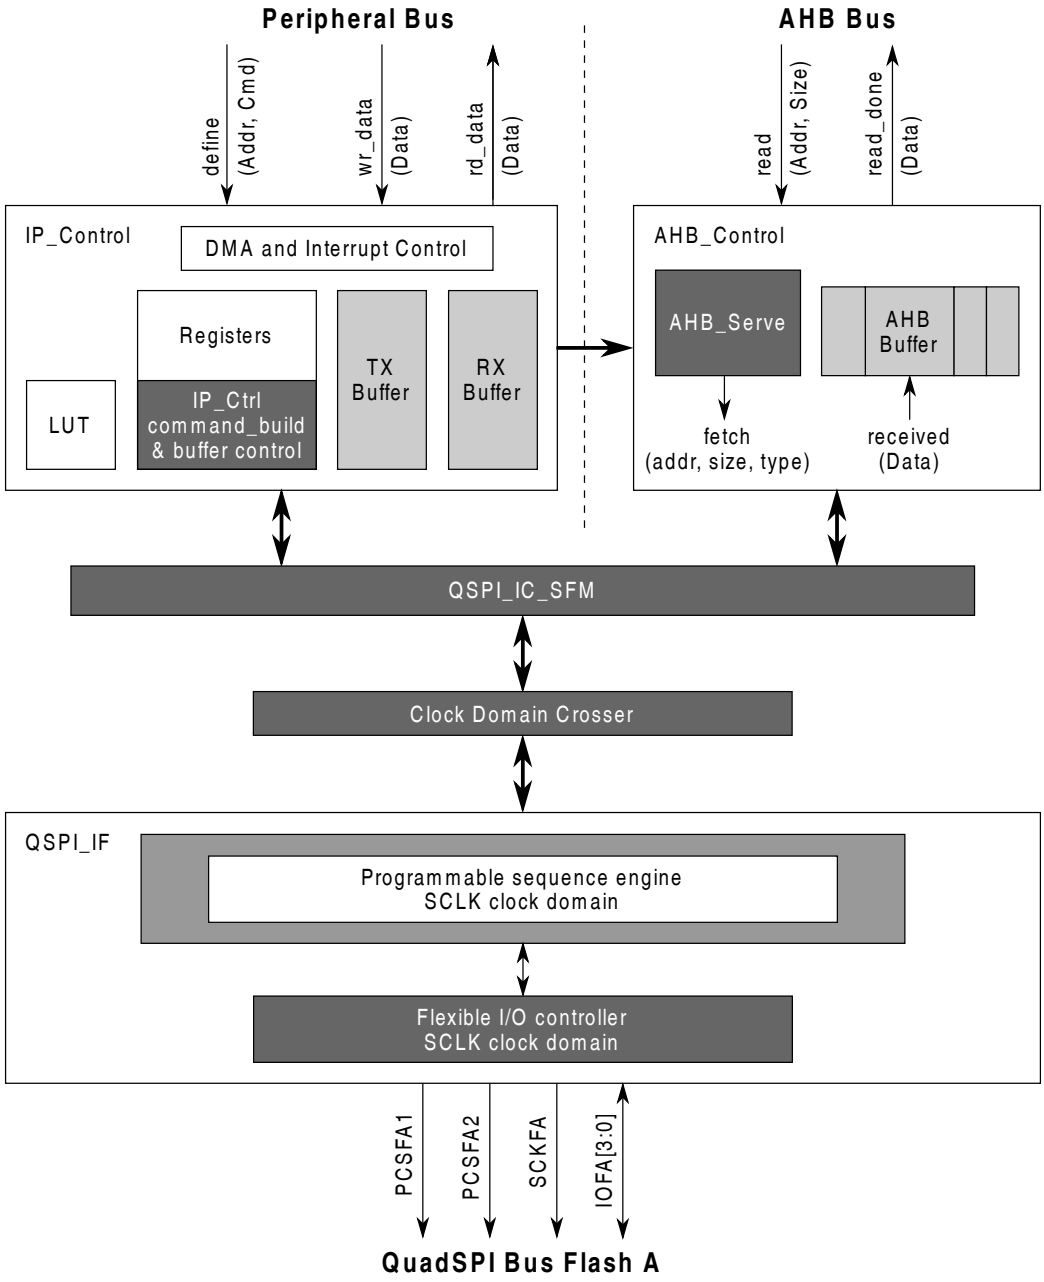

Figure 497. QuadSPI Block Diagram

78.2.5 QuadSPI modes of operation

QuadSPI supports the following modes of operation:

- Normal mode: You can use this mode for write or read accesses to an external serial flash memory device. See Normal mode for details.
  - Serial flash memory write: You can program data into the flash memory through the IP interface only. See Flash memory programming for details.
  - Serial flash memory read: Read the contents of the serial flash memory device. Two separate read channels are available through the RX buffer and AHB buffer. See Flash memory read for details.

- Module Disable mode: You can use this mode for disabling serial flash memory clock and AHB command. The clock to the non-memory mapped logic in QuadSPI can be stopped in the Module Disable mode. The module enters the mode by setting MCR[MDIS].

78.3 External signal description

This section provides the external signal information for the QuadSPI module.

The following table lists the external signals belonging to the module in conjunction with the different modes of operation.

Table 695. Signal properties

Signal name	Function	Direction	Description
PCSFA1	Peripheral Chip Select Flash Memory A1	O	This signal is the chip select for the serial flash memory device A1 that represents the first of the two flash memory devices that share IOFA.
PCSFA2	Peripheral Chip Select Flash Memory A2	O	This signal is the chip select for the serial flash memory device A2 that represents the the second of the two flash memory devices that share IOFA.
SCKFA	Serial Clock Flash Memory A	O	This signal is the serial clock output to the serial flash memory device A.
IOFA[3:0]	Serial I/O Flash memory A	I/O	These signals are the data I/O lines to/from the serial flash memory device A. See Driving external signals for details about the signal drive and timing behavior. Note that the signal pins of the serial flash memory device may change their function according to the SFM Command executed, leaving them as control inputs when single and dual instructions are executed. The module supports driving these inputs to dedicated values. In single I/O mode, QuadSPI drives data on IOFA[0] and expects data on IOFA[1].

NOTE

Please refer to chip specific information to check the configuration of QuadSPI block.

78.3.1 Driving external signals

Single/dual/quad instructions

Depending on the serial flash memory device connected to the QuadSPI module, there are instructions using a different number of data lines:

- Single pad: Single line I/O with one data out and one data in line to/from the serial flash memory device
- Dual pad: Dual line I/O with two bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPI module
- Quad pad: Quad line I/O with four bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPImodule

The different phases of the serial flash memory access scheme are shown in the following figure.

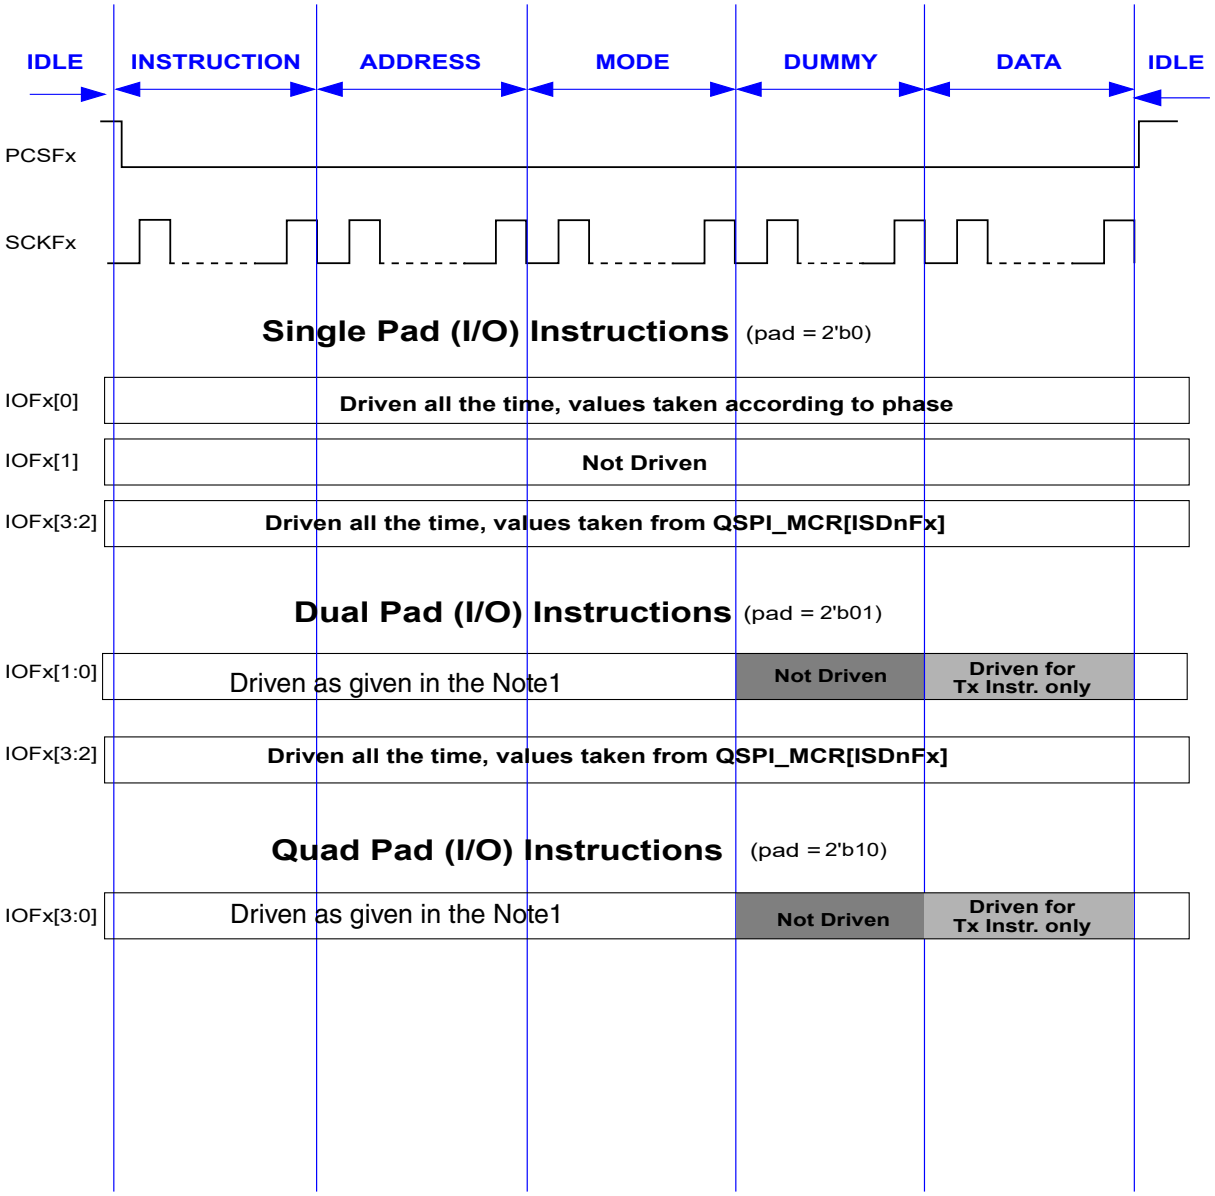

Figure 498. Serial flash memory access scheme

Note1:The IOs are driven from QuadSPI as per the number of pads configured for ongoing phase.

Note:The lines status will change based on command mode in case of instruction, address and mode phases. It can be either 1,2 or 4 lines

Following are the different phases and the I/O driving characteristics of the QuadSPI module:

- Idle: Serial flash memory device not selected – no interaction with the serial flash memory device and the IOFx signals are driven.
- Instruction: Serial flash memory device selected – the instruction is sent to the serial device and all the IOFx signals are driven.
- Address: Serial flash memory address is sent to the device – all the IOFx signals are driven and this phase is not applicable for all SFM commands.
- Mode: Mode bytes are sent to the serial flash memory device – all the IOFx signals are driven and this phase is not applicable for all SFM commands.

- Dummy: Dummy clocks are provided to the serial flash memory device. See Figure 498 for the IOFx signals driven. The actual data lines required for the SFM command executed are not driven for data read commands.

NOTE

— This phase is not applicable for all the SFM commands.

— All read commands in Dual pad, Quad pad modes must use dummy phase before read phase. Note that this restriction is not applicable to Single-pad mode.

- Data: Serial flash memory data are sent to or received from the serial flash memory device. See the preceding figure for the IOFx signals driven. The actual data lines required for the SFM command executed are not driven for data read commands.

NOTE

This phase is not applicable for all the SFM commands.

The PCSFx and SCKFx signals are driven permanently throughout all the phases. In the individual flash memory mode, this applies to the selected flash memory device.

Access to a single, individual serial flash memory device

See Serial flash memory access schemes for details.

Read access to two serial flash memory devices attached to the QuadSPI module in parallel. See Serial flash memory access schemes for details.

78.4 Functional description

This section provides a functional description of the QuadSPI module.

78.4.1 Serial flash memory access schemes

In the individual flash memory mode, all supported commands are available.

78.4.2 Normal mode

This mode allows communication with an external serial flash memory device. Compared to the standard SPI protocol, this communication method uses up to four bidirectional data lines operating at high-data rates. The communication to the external serial flash memory device consists of an instruction code and optional address, mode, dummy, and data transfers. The flexible programmable core engine described below is immune to a wide variety of command or protocol differences in the serial flash memory devices provided by various flash memory vendors.

78.4.2.1 Programmable sequence engine

The core of the QuadSPI module is a programmable sequence engine that works on "instruction-operand" pairs. The core controller executes each programmed instruction sequentially. The complete list of instructions and the corresponding operands are provided in the following table.

Table 696. Instruction set

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
CMD	1d	N={0,1,2}d 0d - One pad 1d - Two pads 2d - Four pads	8-bit command value	Provides the serial flash memory with the SFM command operand (Encoded) on the number of pads specified in STR mode.
ADDR	2d		Number of address bits	Provide the serial flash memory with address cycles according to the operand on the number of pads specified

Table continues on the next page...

Table 696. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
			to be sent (for example, 24d => 24 address bits required)	The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions.
DUMMY	3d		Number of dummy clock cycles (should be <= 64 and > 2 cycles)	Provide the serial flash memory with dummy cycles according the operand The PAD information defines the number of pads in input mode. For example, one pad implies that pad 1 is not driven, rest all are driven.
MODE	4d		8-bit mode value	Provide the serial flash memory with 8-bit operand on the number of pads specified
MODE2	5d	N={0,1}d	2-bit mode value	Provide the serial flash memory with 2-bit operand on the number of pads[1] specified
MODE4	6d	N={0,1,2}d	4-bit mode value	Provide the serial flash memory with 4-bit operand on the number of pads[2] specified
READ	7d	N={0,1,2}d 0d - One pad 1d - Two pads 2d - Four pads	Read data size in bytes (for AHB transactions, your application should ensure that data size is a multiple of 8 bytes)	Read data from flash memory on the number of pads specified The data size can be overwritten by writing to the ADATSZ field of the BUFxCR registers for AHB-initiated transactions and to the IDATSZ field of the IP Configuration Register (IPCR) for IPS-initiated transactions.
WRITE	8		Write data size in bytes	Write data on the number of pads specified The data size can be overwritten by writing to the IDATSZ field of IP Configuration Register (IPCR).
JMP_ON_CS[3]	9d	NA	Instruction number	Every time the CS is deasserted, jump to the instruction pointed to by the operand. This instruction allows the programmer to specify the behavior of the controller when a new read transaction is initiated following a CS deassertion.
STOP[3]	0d	NA	NA	Stop execution; deassert CS

1. For a one-pad instruction, MODE2 takes two serial flash memory clock cycles on the flash memory interface.
2. For a one-pad instruction, MODE4 takes four serial flash memory clock cycles on the flash memory interface. For a four-pad instruction, MODE4 takes one serial flash memory clock cycle on the flash memory interface.
3. Sequence ending with this instruction must have all remaining bits as 0s after it.

The programmable sequence engine allows you to configure the QuadSPI module according to the serial flash memory connected on board. This flexible structure is compatible with new command or protocol changes from different vendors.

78.4.2.2 Flexible read xAHB buffers

To reduce the latency of the reads for AHB masters, the data read from serial flash memory is buffered in flexible AHB buffers. There are four such flexible buffers. The size of each of these buffers is configurable with the minimum size being 0 bytes and maximum size being the size of the complete buffer instantiated (256 bytes). The size of buffer 0 ranges from 0 to BUF0IND. The size of buffer 1 ranges from BUF0IND to BUF1IND, buffer2 from BUF1IND to BUF2IND and, buffer 3 ranges from BUF2IND to the size of the complete buffer (256 bytes).

Each flexible AHB buffer is associated with the following:

- An AHB master: Optionally, buffer3 may be configured as an "all master" buffer by writing 1 to BUF3CR[ALLMST]. When buffer3 is configured in such a way, any access from a master not associated with any other buffer is routed to buffer3.
- A datasize field representing the amount of data to be fetched from the flash memory on every missed access.

The master ID of every incoming request is checked and the data is returned or fetched into the corresponding associated buffer. See the chip-specific QuadSPI information for details about master IDs and their corresponding components. Every missed access to the buffer causes the controller to clear the buffer and fetch the BUFxCR[ADATSZ] amount of data from the serial flash memory. As such, you need not configure the buffer size to be greater than ADATSZ because the locations greater than ADATSZ are never used. For any AHB access, the sequence pointed to by BFGENCR[SEQID] is used for the initiated flash memory transaction. The data is returned to the master as soon as the requested amount is read from the serial flash memory. The controller; however, continues to prefetch the rest of the data in anticipation of a next consecutive request. See Figure 499 that shows flexible AHB buffers.

BFGENCR[SEQID] points to an index of the LUT. See LUT for details.

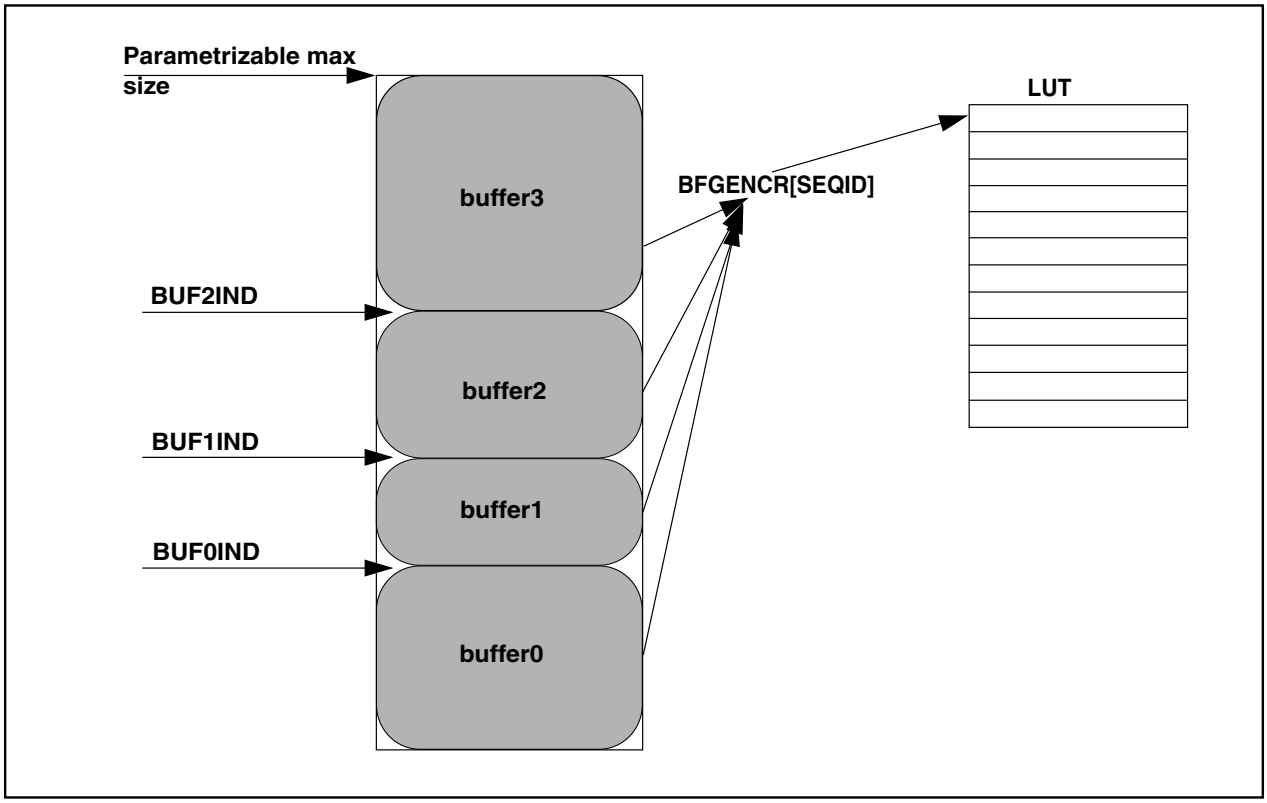

Figure 499. Flexible read AHB buffers

78.4.2.3 Abort mechanism during AHB read

Any ongoing read transaction is aborted if a request from the same master arrives for a location other than the location at which the transaction is going on. The abort can happen at any point of time.

78.4.2.4 HBURST support with AHB read

QuadSPI controller supports HBURST and HSIZE on the AHB read interface. HBURST indicates if the transfer forms part of a burst. Four, eight, and sixteen beat bursts are supported and the bursts might either be incrementing or wrapping. HSIZE indicates the size of the transfer, and supports 8-, 16-, 32-, and 64-bit data sizes. In case of WRAP accesses, QuadSPI generates aligned accesses to serial flash memory if there is no buffer hit for any incoming, non-sequential AHB read access. In case there is a buffer hit, the incoming address in the haddr line is latched as it is. If the total burst size is more than the data prefetch size, an error response is generated and the value of FR[AIBSEF] is configured as 1. The data prefetch size can be defined by BUFxCR[ADATSZ] or data size mentioned in the sequence pointed to by the SEQID field when ADATSZ is programmed as 0. In case of wrap burst, data prefetch size must be greater than or equal to the wrap burst size + 32 bytes. A few examples are shown in the figure below:

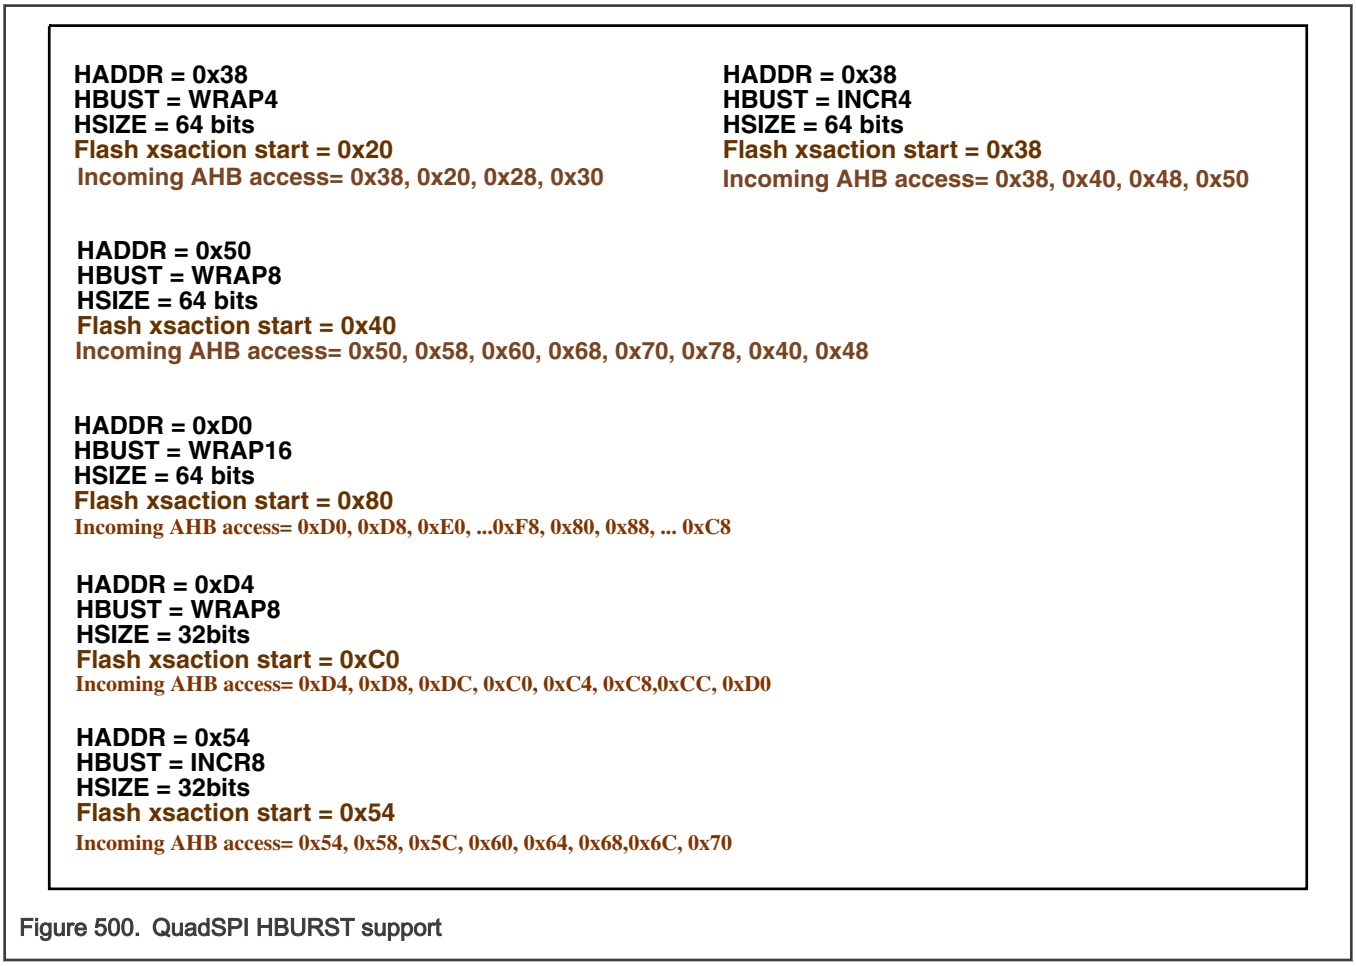

Figure 500. QuadSPI HBURST support

NOTE

The software must take care that the prefetch size should never be set less than the minimum data needed by any external interface to start processing.

NOTE

Whenever a core accesses QuadSPI memory with cache enabled, the prefetch size must be configured as equal or more than the cache line size; otherwise, FR[AIBSEF] error appears.

78.4.2.5 LUT

The LUT consists of a number of pre-programmed sequences. Each sequence is basically a sequence of instruction-operand pairs, which when executed sequentially, generate a valid serial flash memory transaction. Each sequence can have a maximum

of 10 instruction-operand pairs. The LUT can hold a maximum of sequences. The figure below shows the basic structure of the sequence in the LUT.

At reset, the index 0 of the LUT[0..4] is programmed with a basic read sequence as described in Reset sequence. After reset, the complete LUT may be reprogrammed according to the chip connected on board. To protect its contents, during a code runover, the LUT might be locked, after which a write to the LUT will not be successful until it has been unlocked again. The key for locking or unlocking the LUT is 5AF05AF0h, and the associated processes are as follows:

Locking the LUT

1. Write the key 5AF05AF0h into the LUT Key Register (LUTKEY).
2. Write 0b01 to the LUT Lock Configuration Register (LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued). A successful write to this register locks the LUT.

Unlocking the LUT

1. Write the key 5AF05AF0h into the LUT Key Register (LUTKEY).
2. Write 0b10 to the LUT Lock Configuration Register (LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued in between). A successful write to this register unlocks the LUT.

The lock status of the LUT can be read from the LCKCR[UNLOCK] and LCKCR[LOCK] fields.

Some example sequences are defined in Example sequences. After reset the instruction sequence 0 is populated with the default read sequence shown in the table below.

Table 697. Reset sequence

Instruction	Pad	Operand	Comment
CMD	0h	3h	Read data byte command on one pad
ADDR	0h	18h	24 address bits to be sent on one pad
READ	0h	8h	Read 64 bits
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

78.4.2.6 Issuing SFM commands

Each access to the external device follows this sequence:

1. You must pre-populate the LUT with the serial flash memory command sequences that are required for the flash memory device being used.
2. The module executes the instructions in this sequence one by one. The transaction starts and the module configures the value of SR[BUSY].
3. Communication with the external serial flash memory device starts and the transaction executes.
4. After the transaction is complete (all transmit and receive operations with the external serial flash memory device are complete), the module resets SR[BUSY]. In case of an IP command, FR[TFF] is asserted.

For details, see Flash memory programming and Flash memory read.

You can trigger the processing of SFM commands in the QuadSPI module in one of the following ways:

Using IP commands

For IP commands, the required components need to be written into the following registers and in this sequence:

1. Write the serial flash memory address to be used as provided in the Serial Flash Address Register (SFAR). For IP commands not related to specific addresses, the base address of the related flash memory needs to be programmed. For example, for an instruction which does not require an address (that is, write enable instruction), the SFAR should be programmed with the base address of the memory the command is to be sent to.
2. Write the sequence ID and data size details in the IP Configuration Register (IPCR).
3. Note that writing a value to IPCR[SEQID] must be the last step of the sequence. It is possible to combine all the fields of the IPCR into one single write. See IP Configuration Register (IPCR) for details.

Using AHB commands

Any AHB memory-mapped access is routed to one of the buffers depending on the master ID of the request. If the access is a "miss," a new serial flash memory transaction is initiated. The transaction is based on the sequence pointed to by BFGENCR[SEQID] as described in Flexible read xAHB buffers.

An AHB access is considered memory mapped when the access is to the memory-mapped serial flash memories, as described in Memory Mapped Serial Flash Data - Individual Flash mode on Flash memory A.

78.4.2.7 Flash memory programming

In all NOR Flash devices memory sector to be written needs to be erased first. The programming sequence is then initiated in the following way:

1. Check that SR[BUSY] is de-asserted or the value of the BUSY field is 0, also, check that the TX buffer is empty. If you need to discard the data present in the TX buffer (SR[TXNE]) then the TX buffer must be cleared by writing 1 to MCR[CLR_TXF].
2. Program the address related to the command in SFAR.
3. Provide initial data for the program command into the circular buffer through the TBDR. At least one words of data must be written into the TX buffer up to a maximum of 32 entries.
4. Program the IPCR to trigger the command. IPCR[SEQID] should point to an index of the LUT that has the flash memory program sequence pre-programmed. Write an appropriate value to IPCR[IDATSZ] to denote the size of the write in bytes.
5. Repeat step 3, depending on the amount of data required, until all of the required data is written to the TBDR. SR[TXFULL] can be used to check if the buffer is ready to receive more data. At any time, TBSR[TRCTR] can be read to check how many words have been written into the TX buffer.

After writing to IPCR[SEQID] (see step 4), the module starts executing the programmed sequence. The software ensures that the correct sequence is programmed into the LUT in accordance with the flash memory connected to the module. The data is fetched from the TX buffer. It consists of 32 entries of 32-bit sizes and is organized as a circular FIFO, the read pointer for which is incremented after each fetch. When all the data is transmitted, the QuadSPI module returns from the busy state to the idle state. However, this is not true for the external device because the internal programming is still ongoing. You may monitor the relevant status information available from the serial flash memory device and ensure that the programming is done appropriately.

78.4.2.8 Flash memory read

Host access to the data stored in the external serial flash memory device is performed in two steps. First, the data must be read into the internal buffers and in the second step, these internal buffers can be read by the host.

Reading serial flash memory data into the QuadSPImodule internal buffers

A read access to the external serial flash memory device can be triggered in two different ways:

- IP command read: For reading flash memory data into the RX buffer, you must provide the correct sequence ID in IPCR[SEQID]. The sequence ID points to a sequence in the LUT. The software needs to ensure that a correct read sequence is programmed in the LUT in accordance with the serial flash memory device connected on board. You must program the SFAR , and IPCRs. All available read commands supported by the external serial flash memory are possible.

  Optionally, it is possible to clear the RX buffer pointer prior to triggering the IP command by writing a 1 to MCR[CLR_RXF]. This will invalidate the data currently present in the RX buffer and any new read data will overwrite the old one.

Using these inputs, the complete transaction is built when IPCR[SEQID] is written to. The transaction related to the read access starts and the requested number of bytes is fetched from the external serial flash memory device into the RX buffer. As the read access is triggered by an IP command, the value of both SR[IP_ACC] and SR[BUSY] is set to 1.. A count of the number of entries currently in the Rx buffer can be obtained from RBSR[RDBFL].

Communication with the external serial flash memory stops if the specified number of bytes are read (on successful completion of the transaction).

- AHB command read: For reading flash memory data into the AHB buffer, you must:
  - Set up a read access by a master to the address range in the system memory map, which the external serial flash memory devices are mapped to.
  -
  - Program the buffer registers corresponding to the AHB master initiating the request.
  - Provide the correct sequence ID in the BFGENCR. The software ensures that a correct read sequence is programmed in the LUT in accordance with the serial flash memory device connected on board. Flash memory device selection and access mode are determined by the address accessed in the AHB address space associated with the QuadSPI module (see Memory-mapped serial flash memory data—individual flash memory mode on flash memory A

  On each AHB read access to the memory mapped area, the valid data in the AHB buffer is checked against the address requested in the actual read. When the AHB read request cannot be served from the content of the AHB buffer, the buffer is flushed and the controller executes the sequence pointed to by the sequence ID. The requested number of buffer entries defined in BUFxCR[ADATSZ] is then fetched from the external serial flash memory device into the internal AHB buffer. As the read access is triggered through the AHB bus, the value of SR[AHB_ACC] is set, driving SR[BUSY] in turn, until the transaction is complete. Communication with the external serial flash memory stops when the specified number of entries is filled.

Data transfer from the QuadSPI module internal buffers

The data read out from the external serial flash memory device by the QuadSPI module is stored in the internal buffers. The means of accessing the data from the buffer differs depending on which buffer the data is loaded to. See Block diagram for details on the two available buffers, the RX buffer and the AHB buffer, in this module. The buffer appears transparent to you and is non-memory mapped. See the "Flexible AHB Buffer" section for details.

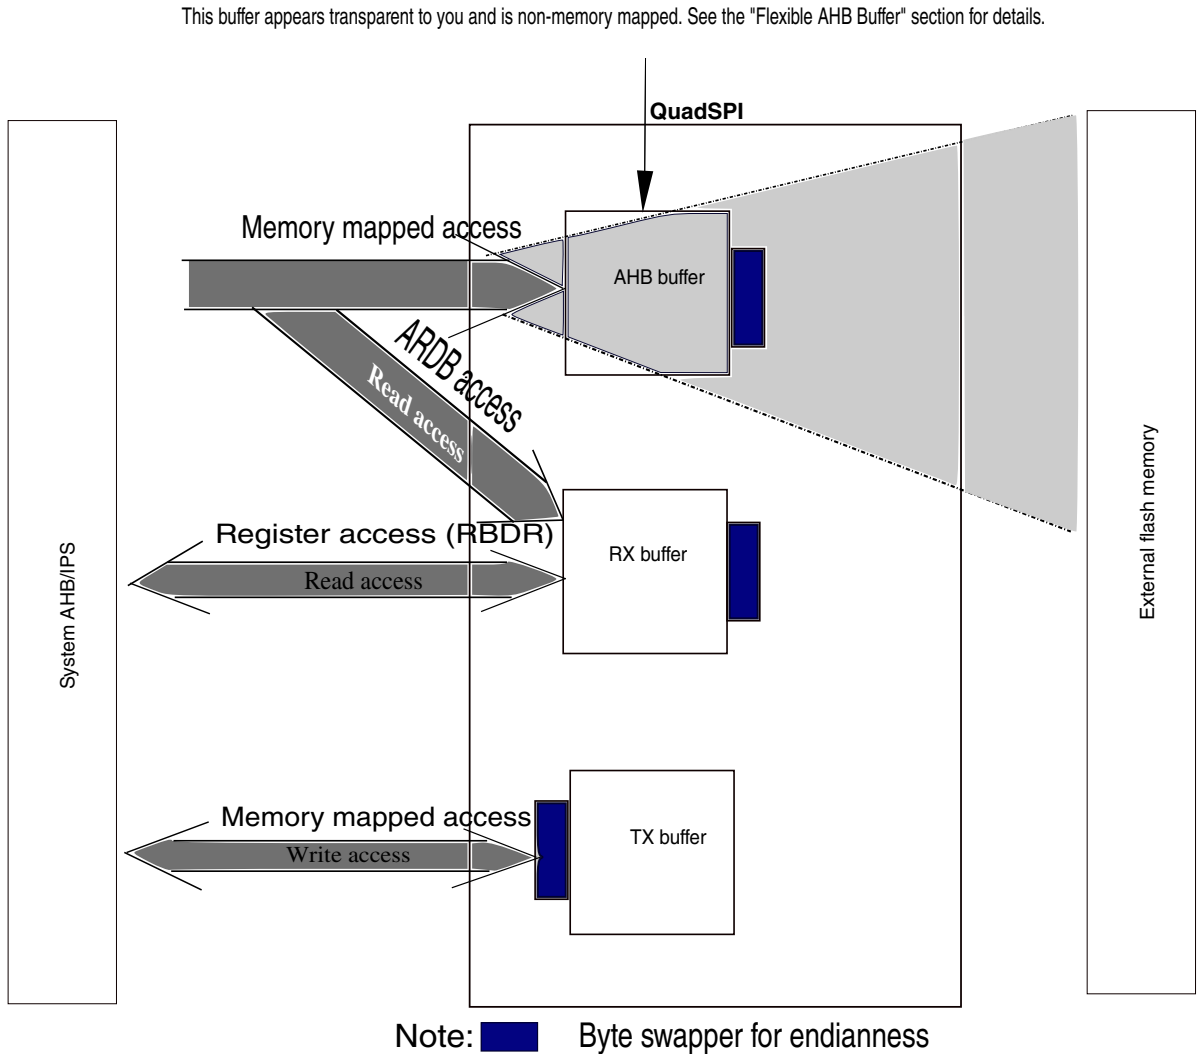

Figure 501. QuadSPI memory map

The RX buffer is implemented as FIFO of depth entries of 4 bytes. Its content is accessible in two different address areas, both referring to identical data and the same physical memory:

- In the IPS address space in the area associated with RX Buffer Data Register (RBDR0 - RBDR63).
- In the AHB address space in the area associated with AHB RX Data Buffer Register (ARDB0 - ARDB127).Two successive entries are accessed with one single 64-bit AHB read operation.

The RX buffer operation can be summarized as follows:

- RBCT[WMRK] determines at which fill level SR[RXWE] is asserted and how many entries are removed from the RX buffer on each buffer POP operation.
- SR[RXWE] indicates that the configured number of data entries is available in the RX buffer and RBSR[RDBFL] indicates how many valid entries are available in total.
- The first entry (RBDR0 or ARDB0) always corresponds to the first valid entry in the RX buffer.

For details, see RX Buffer Data Register (RBDR0 - RBDR63) and AHB RX Data Buffer Register (ARDB0 - ARDB127).

- Flag-based data read of the RX buffer is performed by polling SR[RXWE]. When it is asserted, the valid entries can be read either via the IPS address space (RBDRn) or the AHB address space (ARDBn). A buffer POP operation must be

triggered by the application by writing a 1 to FR[RBDF]. This automatically updates the FIFO to point to the next entry as defined by RBCT[WMRK]. For example, if WMRK is set to 3, then the buffer discards 16 bytes of data.

- DMA-controlled data read of the RX buffer is performed by using the DMA module. The application must ensure that the DMA controller of the related chip is programmed appropriately, as described in DMA usage.
- DMA-controlled read out is triggered fully automatically by the assertion of SR[RXWE]. The related buffer POP operation is also handled completely inside the QuadSPI module. As in the case explained here, accessing the RX buffer content either on RBDRn or ARDBn related addresses is equivalent.
- AHB buffer data read via memory-mapped access: This kind of access is performed by reading one of the addresses assigned to the external serial flash memory device(s) within the range specified in Table 719. If this is not the case, a memory-mapped AHB command read is triggered as described above. If the requested data is already available in the AHB buffer, it is provided directly to the host.

When an AHB access is made to the flash memory mapped address, the data is fetched and returned to the AHB interface. The AHB interface is stalled until the data is fetched. As soon as the data from the requested address is read by the QuadSPI module, the AHB read access is served. Therefore, it is possible to run sequential reads from the AHB buffer at arbitrary speed without the need to monitor any information about the availability of the data. Nevertheless, this access scheme stalls the AHB bus for the time required to read the data from the serial flash memory device. If you know that the access is sequential, a better way is to have a prefetch enabled by programming the value of BUFxCR[ADATSZ] so that the data is fetched into the buffer before the next sequential AHB access.

As long as the host restricts its accesses to the data present in the buffer and to the data currently fetched from the serial flash memory, it is possible to run the host read from the AHB buffer simultaneously with the serial flash memory read into the AHB buffer.

78.4.2.9 Byte ordering of serial flash memory read data

The basic scheme is that the first byte read out of the serial flash memory device, which is addressed by SFAR[SFADR], corresponds to RBDR0[31:24] for IP command read. Similarly, to send a single byte it should be positioned in TBDR[0:7]. In contrast to that for AHB command read, the bytes are always positioned according to the byte ordering of the AHB bus.

- Byte ordering in individual flash memory mode

  The following table provides the byte ordering scheme of how the byte oriented data space of the serial flash memory device is mapped into one single 32-bit entry of the RX buffer or the AHB buffer. The table is valid within the following context:

  — Flash memory A in individual flash memory mode

  — All AHB data read commands with 32-bit access size

Table 698. Byte ordering in individual flash memory mode

Serial flash memory byte numbering	3	2	1	0
Buffer entry bit position [31:0] (32-bit data width)	[31:24]	[23:16]	[15:8]	[7:0]

NOTE

For IP commands, the read size can be specified as number of bytes. If this number is not a multiple of four, then the last buffer entry is not completely filled with the missing higher numbered bytes at undefined values.

  For AHB commands and reads, starting from an address not aligned to 32-bit boundaries, the requested bytes are given at the appropriate positions according to the AMBA AHB specification.

- Buffer entry ordering for 64-bit read access

  For read access via the AHB interface, a 64-bit access is possible. Each 64-bit access reads two 32-bit entries, simultaneously. The ordering of these 32-bit entries within the 64-bit word is provided in the following table.

Table 699. 64-bit read access buffer entry ordering

AHB read data bit position [63:0]	[63:32]	[31:0]
Buffer entry #	Odd (1, 3, 5, ...)	Even (0, 2, 4, ...)

78.4.2.10 Normal mode interrupt and DMA requests

The QuadSPI module has different flags that can only generate interrupt requests and one flag that can generate an interrupt as well as DMA requests. The following table lists the eight conditions. Note that the flags mentioned in the table are associated with the Flag Register (FR).

Table 700. Interrupt and DMA request conditions

Condition	Flag (FR)	DMA
TX buffer fill	TBFF	-
TX buffer underrun	TBUF	-
Illegal instruction error	ILLINE	-
RX buffer drain	RBDF	X
RX buffer overflow	RBOF	-
AHB buffer overflow	ABOF	-
AHB sequence error	ABSEF	-
AHB illegal transaction error	AITEF	-
AHB illegal burst size error	AIBSEF	-
IP command trigger during AHB access error	IPAEF	-
IP command trigger could not be executed error	IPIEF	-
IP command related transaction finished	TFF	-

Each condition has a corresponding field in Flag Register (FR) and a request enable field in DMA Request Select and Enable Register (RSER). FR[RBDF] has separate enable fields for generating IRQ and DMA requests. Note that not all the fields have an individual IRQ line. See the chip's Interrupt Vector table for details.

- Transmit buffer fill interrupt request

  This indicates that the TX buffer can accept new data. The buffer is asserted if FR[TBFF] is asserted and if the value of the corresponding enable field, RSER[TBFIE], is 1. See TX buffer Operation for details on the assertion of FR[TBFF].

  Apart from IRQ, it is possible to handle the TX buffer fill by using the DMA. If the value of RSER[TBFDE] is 1, a DMA request is triggered when the number of available space in the TX buffer is more than the TBCT[WMRK] valid entries and value of SR[TXWA] is set. The application must configure the environment appropriately (for example, the DMA controller) for the DMA transfer.

- Receive buffer drain interrupt or DMA request

  This is derived from FR[RBDF], indicating that the RX buffer of the QuadSPI module has data available from the serial flash memory device to be read by the host. It remains set as long as RBSR[RXWE] is configured. Also, RSER[RBDIE] enables the related IRQ.

Apart from the IRQ, it is possible to handle the RX buffer drain by using the DMA. If the value of RSER[RBDDE] is 1, a DMA request is triggered when the RX buffer contains more than RBCT[WMRK] valid entries. The application must set the environment appropriately (for example, the DMA controller) for the DMA transfers.

- Buffer overflow/underrun interrupt request

  This is a combination of the following fields (all located in the Flag Register (FR) with the related enable bits in the DMA Request Select and Enable Register (RSER)):

  — TBUF - TX buffer underrun, enabled by TBUIE

  — RBOF - RX buffer overflow, enabled by RBOIE

  — ABOF - AHB buffer overflow, enabled by ABOIE

  — The transmit buffer underrun indicates that an underrun condition in the TX buffer has occurred. It is generated when a write instruction is triggered whilst the TX buffer is empty and the the value of RSER[TBUIE] is 1.

  — The receive buffer overflow indicates that an overflow condition in the RX buffer has occurred. It is generated when the RX buffer is full, an additional read transfer attempts to write into the RX buffer, and the value of RSER[RBOIE] is 1.

  — The AHB buffer overflow indicates that an overflow condition in the AHB buffer has occurred. It is generated when the AHB buffer is full, an additional read transfer attempts to write into the AHB buffer and the value of RSER[ABOIE] is 1.

  — The data from the transfers that generated the individual overflow conditions is ignored.

- Serial flash memory command error interrupt request

  If the IPAEF, IPIEF fields in the FR are set, and the related interrupt enable bits in the RSER are also set, then an interrupt is requested.

- Transaction finished interrupt request

  The IP command transaction finished IRQ indicates the completion of the current IP command. It is triggered by FR[TFF] and is masked by RSER[TFIE].

78.4.2.11 TX buffer operation

The TX buffer provides the data used for page programming. For proper operation, it is required to provide at least one entry in the TX buffer prior to starting the execution of the page programming command. The application must ensure that the required number of data bytes is written into the TX buffer fast enough as long as the command is executed without a TX buffer overflow or underrun.

The QuadSPI module sets the FR[TBFF] field as long as the TX buffer is not full and can accept more data. At the end of write through TX buffer, you must clear FR[TBFF] to avoid unnecessary last TX buffer fill interrupt. However, there would always be a pending request asserted from QuadSPI controller at the end of any DMA transfer. When external DMA finishes transfer iteration, this request from QuadSPI is kept asserted for the next iteration loop.

NOTE

Even if the generation of DMA requests for filling the TX buffer is disabled by using RSER[TBFDE], the TX buffer still accepts a DMA transfer because of the last asserted pending request.

Disabling of DMA transfer should be controlled by an external DMA master.

When the QuadSPI module tries to pull data out of an empty TX buffer, FR[TBUB] signals the TX buffer underrun. The TX buffer underrun flag is also asserted when the TX buffer contains less than 32-bits of data and the QuadSPI module tries to pull out data from it. The current IP command leading to the underrun condition is continued until the specified number of bytes is sent to the serial flash memory device. Also, the data that is transferred is in the Fs format. This means, after the underrun flag is set under this condition, it returns Fs until the required number of bytes are not sent. This has been done to ensure that the software does not erase the whole sector after underrun and just reprogramming from failure point serves the purpose. When this sequence command is complete, FR[TBFF] is asserted, indicating that the TX buffer is ready to be written again.

The TX buffer overflow is not signaled explicitly, but TBSR[TRBFL] can monitor the TX buffer fill level.

For more information, see TX Buffer Status Register (TBSR) and Flag Register (FR).

78.4.2.12 Address scheme

Earlier, serial flash memories supported only a 24-bit address space, restricting the maximum memory size of the serial flash memory to 16 MB. The new memory specification supports two types of 32-bit addressing mode in addition to the legacy 24-bit address mode.

Extended address mode

In this mode, the legacy 24-bit commands are converted to accept 32-bit address commands. The flash memory needs to be configured for the 32-bit address mode. Also, while programming the LUT sequence in QuadSPI for 32-bit mode, the ADDR commands should be programmed with 32d as the operand value . By default, QuadSPI is in 24-bit legacy address mode. Each of the memory vendors have a different way of enabling this mode (see the memory specification from memory vendors). For example, the command B7h sent to the Macronix flash memory enables it for the 32-bit address mode.

Extended address register

In this mode, the upper 8 bits of the 32-bit register are provided by the Extended address register in the memory, which provides a specific register that is updated according to the address to be accessed. This effectively converts the legacy 24-bit address command into 32-bit address commands. The memories greater in size than 16 MB consist of banks of 16 MB each. The 8 bits occupied in the extended address register effectively enable a bank. For example, in Spansion memory, when the extended address register is updated with a value of 1h, with the help of the 17h command, it opens Bank1 of the memory. The consequent 24-bit address commands lead to Bank1. The extended address register needs to be updated with the respective value for access to other banks. This effectively converts the legacy 24-bit address command into 32-bit address commands.

78.4.3 Module Disable mode

Module Disable mode is a block-specific mode that the QuadSPI can enter to disable serial flash memory clock and AHB command. This mode can be entered by:

- The host software: by writing a '1' to MCR[MDIS]

Below are the condition that must be fulfilled to enter the Module Disable mode:

- SR[BUSY] = 0
- SR[AHBTRN] = 0
- RBSR[RDBFL] = 0
- SR[RXDMA] = 0
- SR[TXDMA] = 0
- None of the flags in FR are enabled as interrupts is set

The conditions mentioned above ensures the following:

- There is no SFM command currently being executed.
- All the data read into the RX buffer from the serial flash memory have been fetched by the application.
- There is no current AHB access.
- There is no active DMA request.
- There is no enabled interrupt that is pending.

Certain read or write operations have a different effect when the QuadSPI is in the Module Disable mode. In the Module Disable mode, not all of the status and flag bits of the QuadSPI module are updated, and writing to them has no effect. Interrupt and DMA request signals cannot be cleared while in the Module Disable mode.

NOTE

It is illegal to issue a new SFM command starting two clock cycles prior to raising the request of entering the Module Disable mode until the QuadSPI stays in this mode.

78.4.4 Leaving Module Disable mode

In the Module Disable mode, the serial flash memory clock and AHB command to the QuadSPI module are switched off.

After the QuadSPI has left this mode and has returned to Normal mode, the execution of the first SFM command is deferred until the clock to drive that part of the module related to the serial flash memory device is available. Depending upon the point in time when the first SFM command is triggered, the actual execution of the command starts with a delay, respective with the re-enabling of the flash memory clock signal.

78.5 Initialization/application information

This section provides the initialization and application information of the QuadSPI module.

78.5.1 Power up and reset

The serial flash memory devices connected to the QuadSPI module might require special voltage characteristics of their inputs during power up or reset. The application must ensure this.

CAUTION

Erase or program commands should be completed before issuing a reset or power cycle to avoid corrupted flash pages. The application shall ensure there is a backup of critical data stored at a different location to enable recovery from corrupted flash pages.

Example: Flash reset sequence

Use the following sequence to reset flash A:

1. Make sure that the flash supports a reset for the condition CS#=high and IOF[3]=low.
2. Set MCR[SWRSTSD] and MCR[SWRSTHD] fields and then clear them.
3. Set MCR[MDIS] field.
4. Reset MCR[ISD3FA] field for flash A.
5. Clear MCR[MDIS] field.
6. Set MCR[MDIS] field.
7. Set MCR[ISD3FA] field for flash A.
8. Clear MCR[MDIS] field.

78.5.2 Available status/flag information

This section provides an overview of the different flags and statuses available, and their interdependencies for different use cases. The SR and FR are the related registers.

78.5.2.1 IP commands

See IP Configuration Register (IPCR) for additional details not explicitly covered in this paragraph.

- IP commands—normal operation

  Writing to IPCR[SEQID] triggers the execution of a new IP command. Given that this is a legal command, SR[IPACC] and SR[BUSY] are asserted simultaneously, immediately after the execution starts.

  After the instruction on the serial flash memory device is complete, these field deassert and FR[TFF] is configured.

- IP commands—error situations

  See Overview_of_Error_Flags for details.

78.5.2.2 AHB commands

See the "Reading serial flash memory data into the QuadSPI module internal buffers" topic in theFlash Memory Read section for details.

- AHB commands—normal operation

  Memory-mapped read access to a serial flash memory address not contained in the AHB buffer triggers the execution of an AHB command. Given that this is a legal command, SR[AHB_ACC] and SR[BUSY] are asserted simultaneously, immediately after the execution starts. After the instruction on the serial flash memory device is complete, these fields are deasserted.

- IP commands—error situations

  See Overview of FR error flags for details.

78.5.2.3 SFM commands

An SFM command consists of an instruction code and all other parameters (for example, size or mode bytes) needed for that specific instruction code. Triggering a command either initiates a transaction on the external serial flash memory or results in an error. See Table 701 for details on errors.

78.5.2.4 Overview of error flags

The following table provides an overview of the different error flags in the FR and additional error-related details.

Table 701. Overview of FR error flags

Error category	Error flag in FR	Command execution on serial flash memory device TFF behavior (in case of IP commands only)	Description
AHB error flag	ABOF	Flash memory transaction continues until it finishes	Set when the module tries to push data into the AHB buffer that exceeds the size of the AHB buffer. Occurs only because of the wrong programming of BUFxCR[ADATSZ].
AHB error flag	AIBSEF	Flash memory transaction is aborted	Total burst size of the AHB transaction is greater than prefetch data size.
AHB error flag	AITEF	Flash memory transaction is aborted	No response is generated from QuadSPI to AHB bus in case of illegal transaction. Also, the watchdog timer expires.
Miscellaneous error flag	ILLINE	Flash memory transaction aborted	Illegal instruction error flag - set when an illegal instruction is encountered by the controller in any of the sequences.
Command arbitration error	IPIEF	TFF not asserted in conjunction with that command	IP command error - caused when IP access is currently in progress (IP_ACC is set) and during: • Write attempt to IPCR register

Table continues on the next page...

Table 701. Overview of FR error flags (continued)

Error category	Error flag in FR	Command execution on serial flash memory device TFF behavior (in case of IP commands only)	Description
			• Write attempt to SFAR register • Write attempt to RBCT register
Command arbitration error	IPAEF	TFF not asserted in conjunction with that command	• AHB command already running, another IP command could not be executed • AHB command already running, write attempt to IPCR[SEQID]
Buffer-related error	RBOF	TFF is asserted on completion	• RX buffer overrun
Buffer-related error	TBUF	TFF is asserted on completion	• TX buffer underrun

Note that only the buffer-related errors are associated with a transaction on the external serial flash memory. All the other errors do not trigger an actual transaction.

78.5.2.5 IP bus and AHB access command collisions

There are following flags related to this topic: FR[IPAEF] and FR[IPIEF]. See the "Reading serial flash memory data into the QuadSPI module internal buffers" topic of the Flash Memory read section for a description of the flags.

78.5.3 Flash memory device selection

Regardless of the SFM command (IP or AHB), the access mode is selected by specifying the 32-bit address value for the following SFM command.

For IP commands, the access mode is selected with the address programmed into the SFAR register. See Serial Flash Address Register (SFAR) for details.

For AHB commands, the access mode is determined by the memory-mapped address. See AMBA Bus Register Memory Map for details.

78.5.4 DMA usage

For a complete description of the DMA module, see the related DMA Controller chapter. This section only provides QuadSPI-specific DMA usage details.

78.5.4.1 DMA usage in normal mode

78.5.4.1.1 Bandwidth considerations

Careful consideration of the throughput rate of the entire chain (serial flash memory -> AHB bus / IP bus -> DMA controller) involved in the read/write data process is essential for a proper operation. Such analysis must take into account not only the data rate provided by the serial flash memory but also the data rate of the AHB bus and the performance of the DMA controller in reading/writing data from/to the RX/TX buffer.

Two figures must match for a proper operation, which means that the data rate provided by the serial flash memory device must not exceed the average RX buffer readout data rate. Otherwise, the longer this state persists, it results into an RX buffer overflow.

Similarly, the data consumed by the serial flash memory device must not exceed the average TX buffer fill rate. If this persists, it leads to an underrun.

AHB bus side (data read)

The total number of bus cycles for each DMA minor loop completion is added from the following components:

The following table provides certain examples for typical use cases:

Case 1: DMA needs to read 4 bytes from SRAM and provide to QuadSPI. It costs total four bus clock cycles. Then, DMA handshake adds additional six bus clock cycles, resulting in a total of [6 + 4 * (32/4) = 38] bus clock cycles.

Table 702. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 60 MHz bus clock frequency
3	16	6+(16/4)*4 = 22	~366ns
7	32	6+(32/4)*4 = 38	~633ns
11	48	6+(48/4)*4 = 54	~900ns
15	64	6+(64/4)*4 = 70	~1166ns

Case 2: DMA needs to read 32 bytes from SRAM and provide to QuadSPI. DMA handshake takes an additional six bus cycles, with 32 bytes DMA read from SRAM costs (8 + 3) core clock cycles. DMA writes 32 bytes to QuadSPI, takes 2 * (32/4) = 16 bus cycles with one additional CPU access to QuadSPI, costing two bus clock cycles. This results in a total 6 + (8+3)/2 + 2 * (32/4) +2 = 30 bus clock cycles.

Table 703. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop >	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 80 MHz bus clock frequency
3	16	6 + (4+3) /2 + (16/4)*2 + 2 = 20	~333ns
7	32	6 + (8+3) /2 + (32/4)*2 + 2 = 30	~500ns
11	48	6 + (4+3)/2*3 + (48/4)*2 + 2 = 44	~733ns
15	64	6 + (8+3) + (64/4)*2 + 2 = 51	~810ns

NOTE

This table figure represents an ideal scenario; actual performance depends on how the chip integrates DMA and QuadSPI modules.

Serial flash memory device side (data read)

The number of serial flash memory cycles can be determined in the following way:

- Number of serial flash memory clock cycles is required to read 4 bytes, corresponding to one RX buffer entry (setup of command and address not considered): , eight cycles for quad mode (SDR) instructions in individual flash memory mode, and so on.
- Overhead because of clock domain crossing: one cycle

The following table lists the number of clock cycles required to read the data from the serial flash memory corresponding to the different settings of RBCT[WMRK]:

Table 704. Access duration examples for serial flash memory side

RBCT[WMRK] setting	Num bytes per DMA loop [1]	Num SCKFx for 80 MHz SCKFx		Time duration of flash memory data readout for 80 MHz SCKFx (~12.5ns period)	
		IFM [2] quad	IFM quad DDR	IFM quad	IFM quad DDR
0	4	8	4	~100ns	~50ns
1	8	16	8	~200ns	~100ns
3	16	32	16	~400ns	~200ns
7	32	64	32	~800ns	~400ns

1. DMA loop refers to one minor loop completion that is equivalent to one major loop iteration.
2. Individual flash memory mode

NOTE

The table figure represents an ideal scenario; actual performance depends on how the chip integrates with DMA and QuadSPI modules.

A complementary example is when the watermark is set to be too high. In such a case, the time taken by the DMA to read out the RX buffer entries should be lesser than the time taken by the controller to push in the remaining entries in the buffer.

IPS bus side (data write)

The total number of bus cycles for each DMA minor loop completion are added from the following components:

- Overhead for each minor loop, given by DMA controller: assume 10 cycles
- Overhead because to clock domain crossing: assume two cycles
- Number of bus clock cycles required for 16 bytes (128-bit write size): assume four cycles (read/write sequence of DMA controller)

Note that the size of the minor loop is determined by the size of TBCT[WMRK]; therefore, the overhead specified above distributes among (TBCT[WMRK]+1) write accesses of 32-bit each.

The following table provides some examples for typical use cases:

Table 705. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop [1]	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 80 MHz bus clock frequency
3	16	12+4 = 16	~200ns
7	32	12+8 = 20	~250ns
11	48	12+12 = 24	~300ns
15	64	12+16 = 28	~350ns
19	80	12+20 = 32	~400ns

1. DMA loop refers to one minor loop completion that is equivalent to one.

NOTE

The table figure represents an ideal scenario; actual performance depends on how the chip integrates with DMA and QuadSPI modules.

Serial flash memory device side (data write)

The number of serial flash memory cycles can be determined in the following way:

- Number of serial flash memory clock cycles required to write 16 bytes, corresponding to four TX buffer entry (setup of command and address not considered): 32 cycles for quad SDR writes in individual flash memory mode.
- Overhead due to clock domain crossing: one cycle

The following table lists the number of clock cycles required to read the data from the serial flash memory corresponding to the different settings of TBCT[WMRK]:

Table 706. Access duration examples for serial flash memory side

TBCT[WMRK] setting	Num bytes per DMA loop [1]	Num SCKFx		Time duration for consuming data at flash memory interface 100 MHz SCKFx (10 ns period)[2]		Time for FIFO to get empty[3]	
		IFM [4] quad	[5] single IO SDR mode	IFM quad	PFM single IO SDR	IFM quad	PFM single IO SDR
3	16	32	64	320ns	640ns	2240ns	4480ns
7	32	64	128	640ns	1280ns	1920ns	3840ns
15	64	128	256	1280ns	2560ns	1280ns	2560ns
23	96	192	384	1920ns	3840ns	640ns	1280ns

1. DMA loop refers to one minor loop completion that is equivalent to one major loop iteration.
2. Not all flash memory devices support writes at 100 MHz. See the flash memory data sheet for the actual page program frequency supported.
3. The assumption for these timings is that the TX Fifo is full when the transaction is initiated
4. Individual flash memory mode
5. Parallel flash memory mode

NOTE

The tables mentioned above are only examples which must be correlated with the DMA in the system.

Considering the examples provided in the two tables above for TX FIFO, it is evident that depending on the relationship between the bus clock and serial flash memory clock frequencies, there are settings possible where the serial flash memory consumes data faster than the IPS bus can write data in TX buffer. In these cases, a TX buffer underrun situation occurs. To avoid TX buffer underrun, the data transaction size should be large enough.

78.5.5 Flash memory devices address mapping

QuadSPI is configured in Single mode for the supported flash memory port A

The sizes of the flash memory devices are mapped with the system memory space based on the configurations of the following registers:

- SFA1AD
- SFA2AD
- SFB1AD
- SFB2AD

The total memory region for the flash memory devices is mapped between QuadSPI_AMBA_BASE and TOP_ADDR_MEMB2 such that the corresponding CS is asserted based on SFA1AD, SFA2AD and SFB1AD register configurations.

78.5.5.1 Single mode

For single mode configuration, you must write the same value to SFB1AD and SFB2AD registers that you write to the SFA2AD register.

For dual-die flash memories, the values you write to SFB1AD and SFB2AD registers corresponds to the mapped top addresses of each die.

For single-die flash memories, you must write the same value to SFA2AD register that you write to the SFA1AD register.

Following is a programming example for single mode single-die flash memory:

- QuadSPI_AMBA_BASE - 1000_0000h
- SFA1AD[TPADA1] - 2000_0000h
- SFA2AD[TPADA2] - 2000_0000h
- SFB1AD[TPADB1] - 2000_0000h
- SFB2AD[TPADB2] - 2000_0000h

The following figure illustrates the memory mapping for single mode QuadSPI configuration.

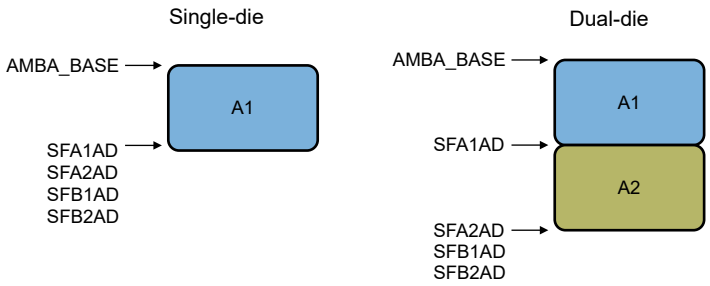

Figure 502. Memory map for Single mode

78.6 Byte ordering – endianness

The following topics show the byte ordering in 64-bit LE configuration for AHB buffer and 32-bit LE for TX/RX buffer.

78.6.1 Programming flash memory data

CPU writes instructions to the TBDR register, such as:

- Write TBDR: 4_03_02_01h
- Write TBDR: 8_07_06_05h

The following table shows the content against each TX buffer entry.

Table 707. Example of QuadSPI TX buffer

TX buffer entry	Content
0	4_03_02_01h
1	8_07_06_05h

Programming the TX buffer into the external serial flash memory device results in the following byte order to be sent to the serial flash memory:

- 01...02...03...04...05...06...07...08

78.6.2 Reading flash memory data into the RX buffer

Reading the content from the same address provides the following sequence of bytes, identical to the write case:

- 01...02...03...04...05...06...07...08

The following table shows the content against each TX buffer entry.

Table 708. Resulting RX buffer content

RX buffer entry	Content
0	4_03_02_01h
1	8_07_06_05h

78.6.2.1 Readout of the RX buffer through RBDRn

The RX buffer content appears at CPU read access through the peripheral bus interface in the following order:

- Read RBDR0: 4_03_02_01h
- Read RBDR1: 8_07_06_05h

78.6.2.2 Readout of the RX buffer through ARDBn

The RX buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- 32-bit access: Read ARDB0: 4_03_02_01h
- 32-bit access: Read ARDB1: 8_07_06_05h
- 64-bit access: Read ARDB0: 8_07_06_05_04_03_02_01h

78.6.3 Reading flash memory data into the AHB buffer

Reading the content from the same address as it was written to provides the following sequence of bytes, identical to the write case:

- 01...02...03...04...05...06...07...08

The following table shows the content against each TX buffer entry.

Table 709. Resulting AHB buffer content

AHB buffer entry	Content
0	8_07_06_05_04_03_02_01h

78.6.3.1 Readout of the AHB buffer through memory-mapped read

The AHB buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- 32-bit read access: 4_03_02_01h
- 32-bit read access: 8_07_06_05h
- 64-bit read access: 8_07_06_05_04_03_02_01h

78.7 Driving flash memory control signals in single and dual modes

In single and dual modes, the serial flash memory devices that can connect to the QuadSPI module expect additional control signals on the inputs, which are connected to IOFA[3], IOFA[2] in the quad mode. For easy interfacing, the outputs IOFA[3:2] for flash memory A are driven to the logic state given by the configuration fields MCR[ISD3FA], MCR[ISD2FA].

These outputs are driven all the time to the logic level programmed in the MCR except the time when quad commands of the serial flash memory are executed. See the specifications of the related serial flash memory device for details about the inactive level.

78.8 Serial flash memory devices

Several different vendors make flash memory devices with a QuadSPI interface. At present, there is no set standard for the QuadSPI instruction set. The most common commands currently have the same instruction code for all vendors; however, some commands are unique to specific vendors. Some of the example sequences are provided in the following sections.

78.8.1 Example sequences

This section provides the example sequences of the QuadSPI module.

Table 710. Exit 4 x I/O read enhance performance mode (XIP) (Macronix) and read status

Instruction	Pad	Operand	Description
CMD	0h	EBh	4xIO read command
ADDR	2h	18h	24-bit address to be sent on four pads
MODE	2h	0h	2 mode cycles (exit XIP)
DUMMY	0h	4h	4 dummy cycles
READ	2h	8h	Read 64 bits
CMD	0h	5h	Read Status register
READ	0h	1h	Status register data
STOP	0h	0h	Stop, instruction over

78.8.1.1 Fast read sequence (Macronix/Numonyx/Spansion/Winbond)

The following table shows the fast read sequence for Macronix/Numonyx/Spansion/Winbond flash memories.

Table 711. Fast read sequence

Instruction	Pad	Operand	Description
CMD	0h	Bh	Fast read command = 0Bh
ADDR	0h	18h	24 address bits to be sent on one pad
DUMMY	0h	8h	Eight dummy cycles
READ	0h	4h	Read 32 bits on one pad
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

78.8.1.2 Fast read quad output (Winbond)

The following table shows the fast read quad output sequence for Winbond memories

Table 712. Fast read quad output sequence

Instruction	Pad	Operand	Description
CMD	0h	6Bh	Fast read quad output command = 6Bh
ADDR	0h	18h	24 address bits to be sent on one pad
DUMMY	0h	8h	Eight dummy cycles
READ	2h	4h	Read 32 bits on four pads
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

78.8.1.3 4 x I/O read enhance performance mode (XIP) (Macronix)

The following table shows the 4 x I/O read enhance performance mode for Macronix flash memories. The enhanced performance mode is also known as XIP mode.

Table 713. Fast read quad output sequence

Instruction	Pad	Operand	Description
CMD	0h	EBh	4xI/O read command = EBh
ADDR	2h	18h	24 address bits to be sent on four pads
MODE	2h	A5h	Two mode cycles
DUMMY	0h	4h	Four dummy cycles
READ	2h	4h	Read 32 bits on four pads
JMP_ON_CS	0h	1h	Jump to instruction 1 (ADDR)

When in XIP mode, the software must ensure that all the flash memories connected to the controller are in this mode. As a part of initializing the controller, all the flash memories might be enabled with XIP by carrying out dummy reads.

78.8.1.4 Dual command page program (Numonyx)

The following table shows the dual command page program sequence for Numonyx flash memories.

Table 714. Dual command page program sequence

Instruction	Pad	Operand	Description
CMD	1h	2h	Dual command page program = 02h on 2 pads
ADDR	1h	18h	24 address bits to be sent on two pads
WRITE	1h	20h	Write 32 bytes on two pads

Table continues on the next page...

Table 714. Dual command page program sequence (continued)

Instruction	Pad	Operand	Description
STOP	0h	0h	Stop, instruction over

78.8.1.5 Sector erase (Macronix/Numonyx/Spansion)

The following table shows the Sector erase sequence for the Macronix/Numonyx/Spansion flash memories.

Table 715. Sector erase sequence

Instruction	Pad	Operand	Description
CMD	0h	20h	Sector erase command = 20h
ADDR	0h	18h	24 address bits to be sent on one pad
STOP	0h	0h	Stop, instruction over

78.8.1.6 Read status register (Macronix/Numonyx/Spansion/Winbond)

The following table shows the read status register sequence for Macronix/Numonyx/Spansion/Winbond flash memories.

Table 716. Read status register sequence

Instruction	Pad	Operand	Description
CMD	0h	0h5	Read status register command = 05h
READ	0h	0h1	Read status register data
STOP	0h	0h	Stop, instruction over

78.9 Sampling of serial flash memory input data

78.9.1 Basic description

QuadSPI is used to read data from the serial flash memory device. Depending on the actual implementation, there is a delay between the internal clocking in the QuadSPI module and the external serial flash memory device. See the following figure for an overview of this scheme.

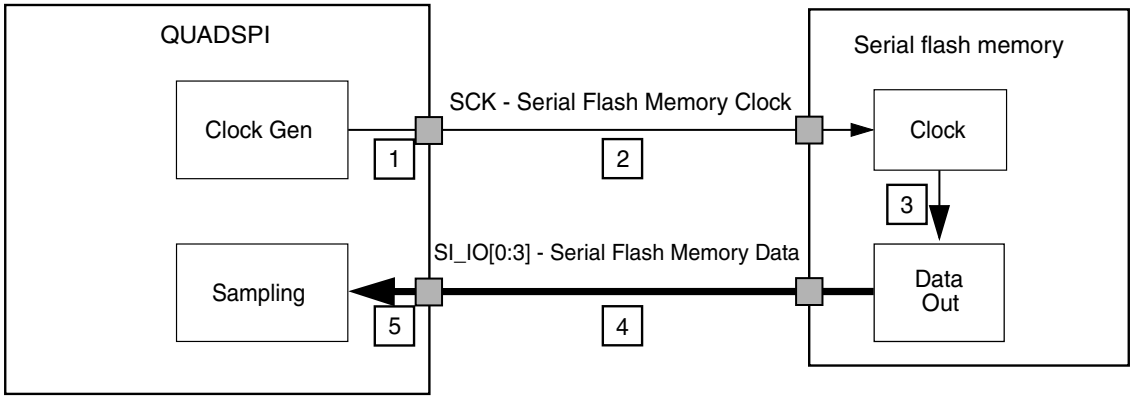

Figure 503. Serial flash memory sampling clock overview

The rising edge of the internal reference clock is taken as timing reference for the data output of the serial flash memory. After a time of t_{total_delay} the data arrives at the internal sampling stage of the QuadSPI module. Considering the figure provided here, the following parts of the delay chain contribute to t_{total_delay}:

- Output delay of the serial flash memory clock output of the device containing the QuadSPI module
- Wire delay of application/PCB from the device containing the QuadSPI module to the external serial flash memory device
- Clock to data out delay of the external serial flash memory device, including input and output delays
- Wire delay of application/PCB from the external serial flash memory device to the device containing the QuadSPI module
- Device delay corresponding to the input data

NOTE

The t_{total_delay} is specific to the characteristics of the actual implementation. Also, the serial flash memory device clock (SCK) is inverted with respect to the QuadSPI internal reference clock.

78.9.2 DQS sampling method

78.9.2.1 Basic description

In the DQS mode, the data strobe signal (DQS/RWDS) is used to sample the read data. Here, both DQS and the data sent by the flash memory move in the same direction; therefore, it is relatively easier to achieve at higher frequencies.

When using DQS for SDR reads, QuadSPI internally samples the incoming data on the rising edge of the strobe signal.

The next figure shows the sampling read data in the SDR mode using the DQS.

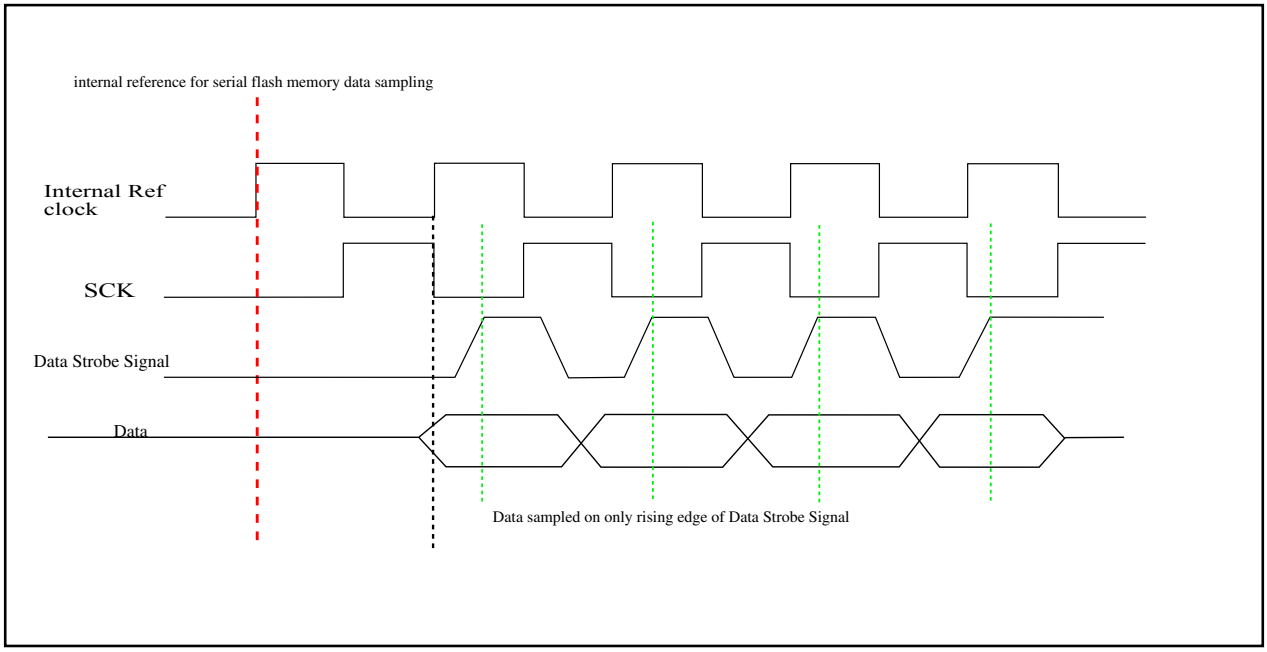

Figure 504. Data strobe functionality in SDR mode for read operation.

NOTE

Consider "Data Strobe Signal" as "Data Strobe Signal driven by memory" and "Data" as "Data from memory".

NOTE

Refer to the Datasheet for specific timing waveforms of QuadSPI

NOTE

For Specific details - Refer to the Data Sheet specification of QuadSPI module.

78.9.2.2 Dummy Pad loopback

The internal clock is loop-backed from the dummy internal pad to compensate data pad delays. This can be enabled by configuring the value of MCR[DQS_FA_SEL] as "01" for flash memory A. This mode can be used with the following configuration:

- High/low frequency delay chain manual programming in bypass mode using DLLCRA[SLV_DLY_COARSE] and DLLCR[FREQEN].

NOTE

Refer to Auto-DataLearning (4x Sampling method) section with DLL for further details

NOTE

This mode may not be available on the chip. See the "Supported read modes" section in the chip-specific QuadSPI information for the read modes that this chip supports.

78.10 Delay chain usage

Slave delay chain programming sequence—

Following is the programming sequence for DLL bypass mode.

1. Program DLLCRA[SLV_EN]=1, DLLCRA[SLV_DLL_BYPASS]=1, and DLLCRA[SLAVE_AUTO_UPDT]=0.

2. Program the following fields to provide the desired DQS delay for sampling: DLLCRA[SLV_FINE_OFFSET], DLLCRA[SLV_DLY_COARSE], and DLLCR[FREQEN]. See the chip-specific QuadSPI information for the supported programming settings.
3. Program DLLCRA[SLV_UPD]=1 to load these values in the slave delay chain.
4. Check the slave delay chain update status by polling DLLSR[SLVA_LOCK]=1 and clear DLLCRA[SLV_UPD] after confirming the update state.

78.11 Memory map and register definition

This section provides the memory map and register definitions for the QuadSPI module.

78.11.1 Register write access

Following are the write access restriction terms that apply to all the registers:

- Register write access restriction

  For each register field, the write access conditions are specified in the detailed register description.

  The following table provides a description of the write access conditions. If, for a specific register bit or field, none of the given write access conditions is fulfilled, any write attempt to this register bit or field is ignored without any notification. The values of the bits or fields are not changed.

  The condition term [A or B] indicates that the register or field can be written to if at least one of the conditions is fulfilled.

Table 717. Register write access restrictions

Condition	Description
Anytime	No write access restriction
Disabled mode	Write access only if MCR[MDIS] = 1
Normal mode	Write access only if the module is in the normal mode

- Register write access requirements

  You can access all registers using 8-bit, 16-bit, and 32-bit wide operations. For some of the registers, at least a 16-bit or 32-bit wide write access is required to ensure correct operation. This write access requirement is stated in the detailed register description for each affected register.

78.11.2 QuadSPI register descriptions

This section provides the memory map and register definitions for the QuadSPI module.

Access to the following addresses does not result in a transfer error:

- 4h
- 50h
- 64h
- 104h
- 120h
- 138h
- 168h
- 188h
- 18Ch

1 SWRSTHD	Software reset for AHB domain 0b - De-assert Software reset 1b - AHB domain flops are reset. This field does not reset configuration registers. It is advisable to reset both the serial flash memory domain and AHB domain at the same time. Resetting only one domain might lead to side effects. **NOTE** The software resets need the clock to be running to propagate to the design. The value of MCR[MDIS] should be 0 when the software reset bits are asserted. Also, before they can be deasserted again (by setting MCR[SWRSTHD] to 0), it is recommended to set the value of MCR[MDIS] to 1. After the software resets have been deasserted, the normal operation can be started by setting MCR[MDIS] to 0. **NOTE** Software must wait for at least three system cycles and three flash cycles after changing the value of this field.
0 SWRSTSD	Software reset for serial flash memory domain 0b - De-assert Software reset 1b - Serial flash memory domain flops are reset. This field does not reset configuration registers. It is advisable to reset both the serial flash memory domain and AHB domain at the same time. Resetting only one domain might lead to side effects.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE The software resets need the clock to be running to propagate to the design. The value of MCR[MDIS] should therefore be 0 when the software reset bits are asserted. Also, before they can be deasserted again (by specifying 0 as the value for MCR[SWRSTSD]), it is recommended to specify 1 as the value for MCR[MDIS]. After the software resets are deasserted, the normal operation can be started by specifying 0 as the value for MCR[MDIS]. **NOTE** Software must wait for at least three system cycles and three flash cycles after changing the value of this field.

78.11.2.3 IP Configuration Register (IPCR)

Offset

Register	Offset
IPCR	8h

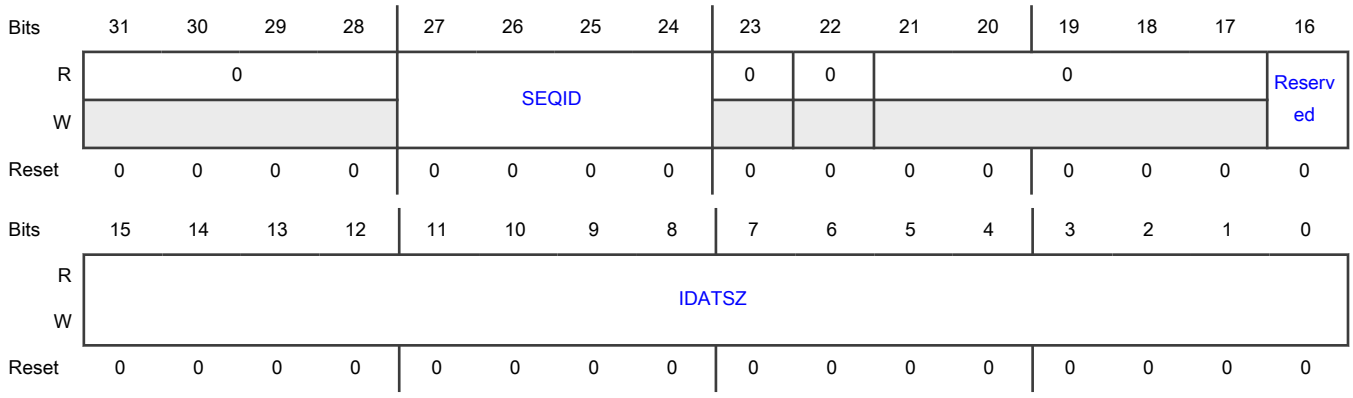
Function

This register provides all the configuration required for an IP-initiated command, which can be triggered by writing in the SEQID field of this register. If the SEQID field is written successfully, a new command to the external serial flash memory is initiated per the sequence pointed to by this field. See Normal mode for details on command triggering and command execution.

Special write-access is permitted if:

- SR[IP_ACC]=0

Diagram



Fields

Field	Function
31-28 —	Reserved
27-24 SEQID	Points to a sequence in the LUT This field contains the sequence index of the LUT. See LUT for details. Each sequence index can accommodate up to 10 instructions (2 instructions per register). A write to this field triggers a transaction on the serial flash memory interface.
23 —	Reserved
22 —	Reserved
21-17 —	Reserved
16 —	Reserved
15-0 IDATSZ	IP data transfer size This field defines the data transfer size, in bytes, of the IP command.

78.11.2.4 Flash Memory Configuration Register (FLSHCR)

Offset

Register	Offset
FLSHCR	Ch

Function

This register contains the timings that are specific to the flash memory device. The QuadSPI controller must meet these timings for the device to function correctly.

Special write-access is permitted if:

- SR[AHB_ACC] = 0
- SR[IP_ACC] = 0

Diagram

3-0 TCSS	Serial flash memory CS setup time This setup time is in terms of serial flash memory clock cycles, and it must be greater than or equal to two flash memory clock cycles. Refer the chip Datasheet for the exact value.

78.11.2.5 Buffer 0 Configuration Register (BUF0CR)

Offset

Register	Offset
BUF0CR	10h

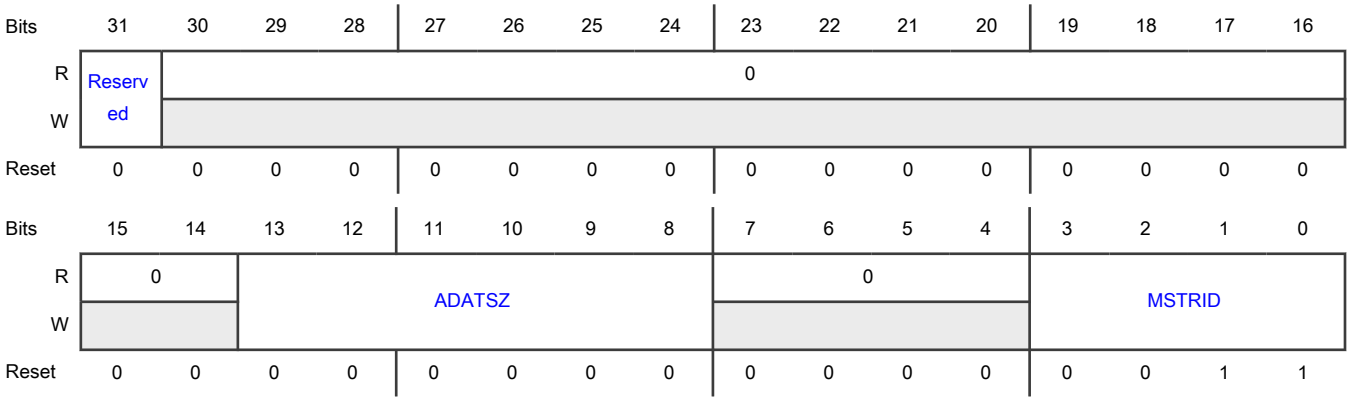
Function

This register provides the configuration for any read access routed to buffer0, which happens when the master ID of the incoming AHB request matches BUF0CR[MSTRID]. Any buffer "miss" leads to a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31 —	Reserved
30-14 —	Reserved
13-8 ADATSZ	AHB data transfer size Defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. For example, a value of 0x2 sets transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. The software should ensure that this transfer size is not greater than the size of the buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 0 Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

78.11.2.6 Buffer 1 Configuration Register (BUF1CR)

Offset

Register	Offset
BUF1CR	14h

Function

This register provides the configuration for any access routed to buffer 1, which happens when the master ID of the incoming AHB request matches the MSTRID field of this register. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram

For example, a value of 0x2 sets the transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. Software should ensure that this transfer size is not greater than the size of this buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 1

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

78.11.2.7 Buffer 2 Configuration Register (BUF2CR)

Offset

Register	Offset
BUF2CR	18h

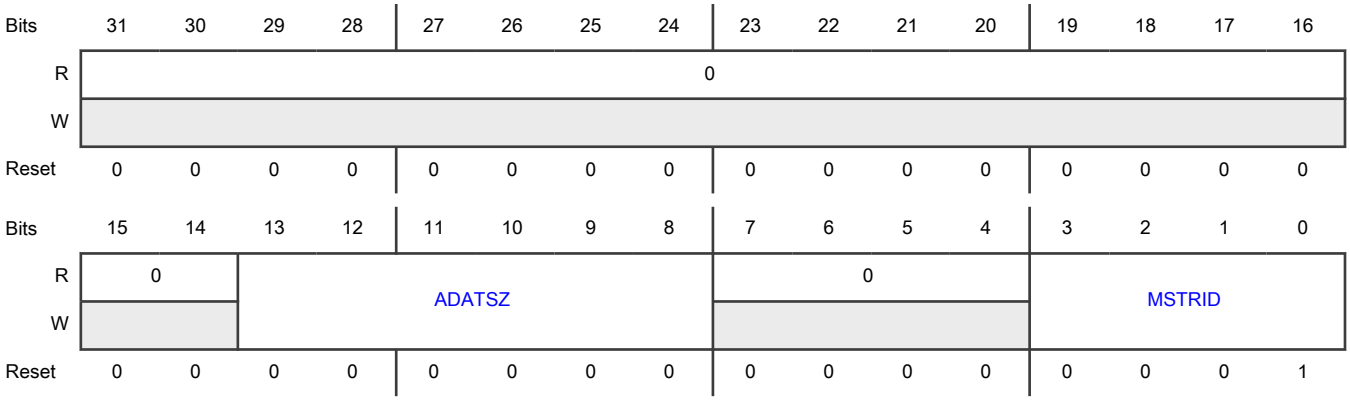
Function

This register provides the configuration for any access routed to buffer 2, which happens when the master ID of the incoming AHB request matches the MSTRID field of this register. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-14 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
13-8 ADATSZ	AHB data transfer size This field defines the read data transfer size in 8 bytes of an AHB triggered read access to the serial flash memory. For example, a value of 0x2 sets transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. The software should ensure that this transfer size is not greater than the size of this buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID The ID of the AHB master associated with BUFFER2. Any AHB read access with this master ID is routed to this buffer. It must be ensured that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

78.11.2.8 Buffer 3 Configuration Register (BUF3CR)

Offset

Register	Offset
BUF3CR	1Ch

Function

This register provides the configuration for any access to buffer 3.

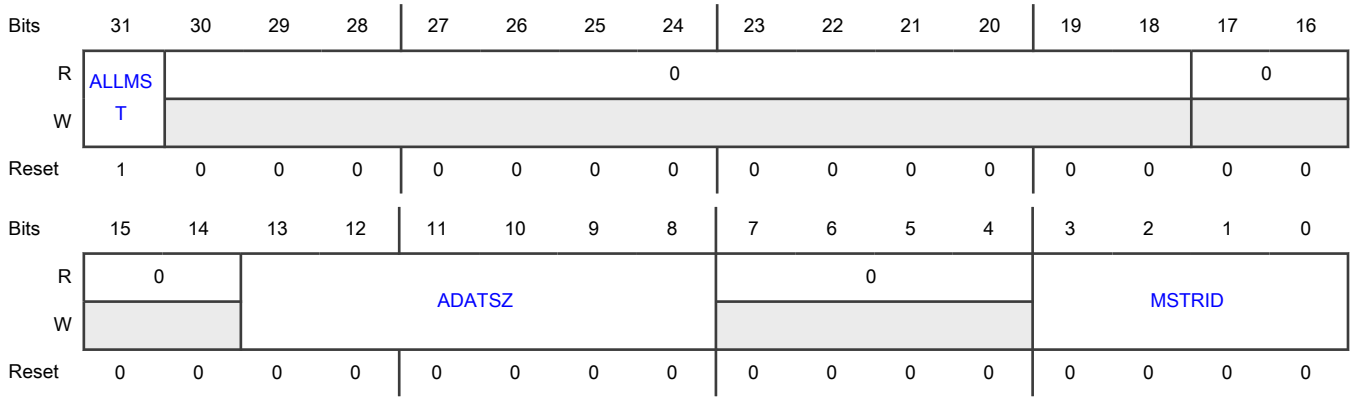
An access is routed to buffer 3 when the master ID of the incoming AHB request matches the MSTRID field of BUF3CR. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

In case the value of the ALLMST field is not 1, any such transaction (where master ID does not match any of the MSTRID fields) is returned with an ERROR response.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31 ALLMST	All master enable When set, buffer3 acts as an all-master buffer. Any AHB access with a master ID not matching with the master ID of buffer0, buffer1, or buffer2 is routed to buffer3. When set, the MSTRID field of this register is ignored.
30-18 —	Reserved
17-14 —	Reserved
13-8 ADATSZ	AHB data transfer size Defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 3. Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

78.11.2.9 Buffer Generic Configuration Register (BFGENCR)

Offset

Register	Offset
BFGENCR	20h

Function

This register provides generic configuration to any of the buffer accesses. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by the SEQID field.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

78.11.2.11 Buffer 0 Top Index Register (BUF0IND)

Offset

Register	Offset
BUF0IND	30h

Function

This register specifies the top index for buffer 0, which defines its size. Note that the three LSBs of this register are set to 0. This ensures that the buffer is 64-bit aligned because each buffer entry is 64-bits long.

The register value should be set to the desired number of bytes. For example, setting BUF0IND[31:3] to 0 gives 0 bytes, setting the value to 1 gives 8 bytes, and so on.

The size of buffer 0 is the difference between BUF0IND and 0.

The software must ensure that the value of TPINDX0 is not greater than the size of buffer 0.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram

23-20 —	Reserved
19-16 SLV_FINE_OFFSET	Fine offset delay elements in incoming DQS This field sets the number of fine offset delay elements up to 16 in incoming DQS, and the default must be 1 element.
15 —	Reserved
14-12 SLV_DLY_OFFSET	T/16 offset delay elements in incoming DQS This field sets the number of T/16 offset delay elements in incoming DQS; default is 0.
11-8 SLV_DLY_COARSE	Delay elements in each delay tap This field sets the number of delay elements in each delay tap. The field is used to overwrite DLL-generated delay values and works when the value of SLV_DLL_BYPASS is 1. Note : Please refer to the QuadSPI datasheet for more details.
7-5 —	Reserved
4 —	Reserved
3 —	Reserved
2 SLV_EN	Slave enable 0b - DLL slave logic remains in reset, and its value should be 0 for at least three flash memory clock cycles for reset. 1b - Enables DQS slave delay chain, and should be 1 before any slave configuration settings take place.
1 SLV_DLL_BYPASS	Slave DLL bypass This field enables selection of the number of delays in each slave delay tap. 0b - Disables manual selection of coarse delays in the slave delay chain. 1b - Enables selection of number of delays in each slave delay tap, based on DLLCRA[SLV_DLY_COARSE].
0	Slave update

Table continues on the next page...

Table continued from the previous page...

Field	Function
SLV_UPD	You must program this field only after slave delay chain configuration takes place. 0b - Disables any further update on DQS slave delay chain. 1b - Updates the DQS slave delay chain with either ref-delay or bypass slave delay value, and should be set in the absence of the DQS clock.

78.11.2.15 Serial Flash Memory Address Register (SFAR)

Offset

Register	Offset
SFAR	100h

Function

The module automatically translates this address on the memory map to the address on the flash memory. When operating in a 24-bit mode, only bits 23-0 are sent to the flash memory. In the 32-bit mode, bits 27-0 are used with bits 31-28 driven to 0 . See Table 718 for the mapping between the access mode and the SFAR content and Normal mode for details on command triggering and command execution. The software must ensure that the serial flash memory address provided in the SFAR register lies in the valid flash memory address range, as defined in Table 718.

Special write-access is permitted if:

- SR[IP_ACC] = 0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								RDBFL							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-16 RDCTR	Read counter Indicates the number of 4-byte entries removed from the RX buffer. For example, a value of 0x2 indicates that 8 bytes have been removed. It is incremented by the number (RBCT[WMRK] + 1) on RX buffer POP event. The RX buffer can be popped using DMA or FR[RBDF]. The RSER[RBDDE] defines which pop should be pursued. For details, see AHB RX Data Buffer Register (ARDB0 - ARDB127) and Data Transfer from the QuadSPI Module Internal Buffers.
15-8 —	Reserved
7-0 RDBFL	RX buffer fill level Indicates the number of 4-byte entries available in the RX buffer. For example, a value of 0x2 indicates 8 bytes are available.

78.11.2.18 RX Buffer Control Register (RBCT)

Offset

Register	Offset
RBCT	110h

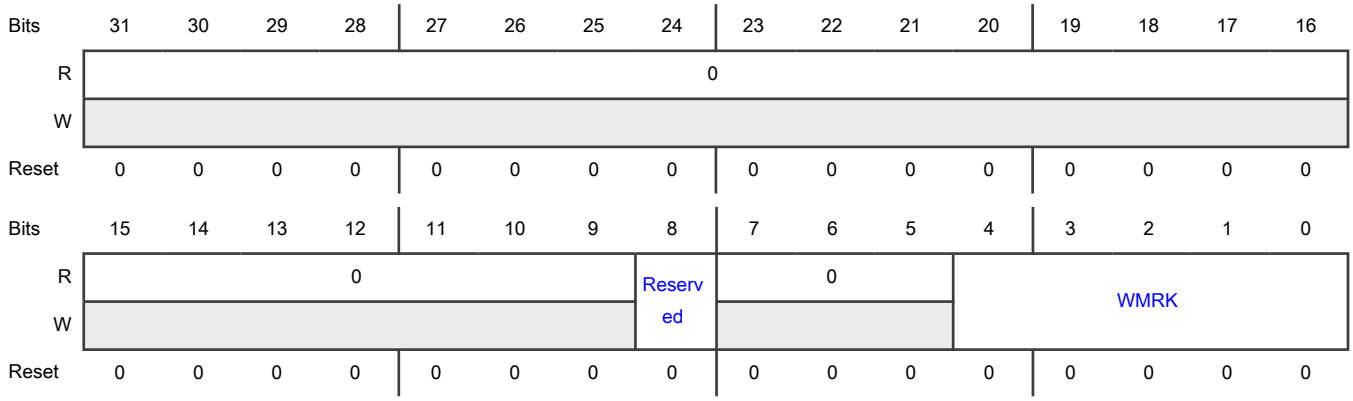
Function

This register contains control data related to the receive data buffer.

Special write-access is permitted if:

- SR[IP_ACC] = 0

Diagram



Fields

Field	Function
31-9 —	Reserved
8 —	Reserved
7-5 —	Reserved
4-0 WMRK	RX buffer watermark This field determines when the readout action of the RX buffer is triggered. When the number of valid entries in the RX buffer is equal to or greater than the number provided by (WMRK+1), the SR[RXWE] flag is asserted. The value should be entered as the number of 4-byte entries minus 1. For example, a value of 0x0 sets the watermark to 4 bytes, 1 to 8bytes, 2 to 12 bytes, and so on. For details, see DMA usage. **NOTE** This field should never be programmed above 63 because there are only 64 memory mapped RBDR registers. If watermark is programmed above 63, data above 64 words will be lost.

78.11.2.19 Data Learning Status Flash Memory A Register (DLSR_FA)

Offset

Register	Offset
DLSR_FA	134h

Function

This register shows sampling point selected by data learning algorithm when the value of DLSR_FA[DLPFFA] is 0. Otherwise, it shows the pattern matching outline.

R	0								0				TRBFL			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-16 TRCTR	Transmit counter This field indicates how many entries of 4 bytes have been written into the TX buffer by host accesses. It is reset to 0 when a 1 is written to MCR[CLR_TXF]. It is incremented on each write access to the TBDR register when another word has been pushed onto the TX buffer. When it is not cleared, the TRCTR field wraps around to 0. See TX Buffer Data Register (TBDR) for details.
15-9 —	Reserved
8-6 —	Reserved
5-0 TRBFL	TX buffer fill level This field contains the number of entries of 4 bytes each available in the TX buffer for the QuadSPI module to transmit to the serial flash memory device. The value of this field can reach maximum up to the total TX buffer size.

78.11.2.21 TX Buffer Data Register (TBDR)

Offset

Register	Offset
TBDR	154h

Function

This register provides access to the circular TX buffer of depth 32 , so the total size is 32 * 4 bytes. This buffer provides the data written into it as write data for the page programming commands to the serial flash memory device. See Table 698 for the byte ordering scheme. A write transaction on the flash memory with data size of less than 32 bits leads to the removal of one data entry from the TX buffer. The valid bits are used and the rest of the bits are discarded.

Special write-access is permitted if:

- SR[TXFULL] = 0

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	TXDATA

R W	TXDATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TXDATA	TX data On write access, the data is written to the next available entry of the TX buffer and TBSR[TRBFL] is updated accordingly. On a read access, the last data written to the register is returned.

78.11.2.22 TX Buffer Control Register (TBCT)

Offset

Register	Offset
TBCT	158h

Function
This register contains control information for transmit data buffer.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-8 —	Reserved
7-5 —	Reserved
4-0 WMRK	Watermark for TX buffer Determines the watermark for the TX buffer When the number of available space in the TX buffer is greater than or equal to the number provided by WMRK (number of 4-byte entries), SR[TXWA] is asserted. For example, a value of 0x1 sets the watermark to 4 bytes, 0x2 sets it to 8 bytes, 0x3 sets it to 12 bytes, and so on. For details, see DMA usage. WMRK = 0 is invalid.

78.11.2.23 Status Register (SR)

Offset

Register	Offset
SR	15Ch

Function

This register provides all the available status information about SFM command execution and arbitration, the RX buffer, TX buffer, and the AHB buffer.

Diagram

Fields

Field	Function
31-29 —	Reserved
28 —	Reserved
27 TXFULL	TX buffer full Asserted when the FIFO level reaches 39 (that is, TX buffer size of 32 + async FIFO size of 7)
26 TXDMA	TX DMA Asserted when the TXFIFO fill via DMA is active and DMA is requested or running
25 TXWA	TX buffer watermark available Asserted when the number of available spaces in the TX buffer is greater than or equal to the value provided by TBCT[WMRK] Example: When TBCT[WMRK]=1, SR[TXWA] is de-asserted when TX FIFO has 32+7(size of async FIFO) entries
24 TXNE	TX buffer not empty Asserted when TX buffer contains data
23 RXDMA	RX buffer DMA Asserted when RX buffer read out via DMA is active; that is, when DMA is requested or running
22-20 —	Reserved
19 RXFULL	RX buffer full Asserted when the RX buffer is full; that is, when RBSR[RDBFL] is equal to 128
18-17 —	Reserved
16 RXWE	RX buffer watermark exceeded Asserted when the number of valid entries in the RX buffer exceeds the number provided in RBCT[WMRK]
15 —	Reserved
14 AHB3FUL	AHB 3 buffer full Asserted when AHB 3 buffer is full
13	AHB 2 buffer full

Table continues on the next page...

Table continued from the previous page...

Field	Function
AHB2FUL	Asserted when AHB 2 buffer is full
12 AHB1FUL	AHB 1 buffer full Asserted when the AHB 1 buffer is full
11 AHB0FUL	AHB 0 buffer full Asserted when the AHB 0 buffer is full
10 AHB3NE	AHB 3 buffer not empty Asserted when the AHB 3 buffer contains data
9 AHB2NE	AHB 2 buffer not empty Asserted when the AHB 2 buffer contains data
8 AHB1NE	AHB 1 buffer not empty Asserted when the AHB 1 buffer contains data
7 AHB0NE	AHB 0 buffer not empty Asserted when the AHB 0 buffer contains data
6 AHBTRN	AHB access transaction pending Asserted when there is a pending request on the AHB interface. See Flash memory mapped AMBA bus.
5 —	Reserved
4 —	Reserved
3 —	Reserved
2 AHB_ACC	AHB read access Asserted when the currently executed transaction is initiated by the AHB bus
1 IP_ACC	IP access Asserted when transaction currently executed is initiated by the IP bus
0 BUSY	Module busy Asserted when module is currently busy handling a transaction to an external flash memory device

78.11.2.24 Flag Register (FR)

Offset

Register	Offset
FR	160h

Function

This register provides all available flags about SFM command execution and arbitration, which may serve as the source for the generation of interrupt service requests. Note that the error flags in this register do not relate directly to the execution of the transaction in the serial flash memory device itself but only to the behavior and conditions visible in the QuadSPI module.

Special write-access is permitted in the enabled mode.

Diagram

Fields

Field	Function
31 —	Reserved
30 —	Reserved
29 —	Reserved
28 —	Reserved
27 TBFF	TX buffer fill flag

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Before writing to the TX buffer, this field should be cleared. Then, it should be read back. If it is set, the TX buffer can include more data. If the field remains cleared, the TX buffer can be considered as full. See TX buffer operation for details.
26 TBUF	TX buffer underrun flag This field is set if the module tries to pull data when the TX buffer is empty. The IP command leading to the TX buffer underrun is continued (data sent to the serial flash memory device is undefined). Here, a valid underrun means that it should have occurred during the transaction so that few bytes (that is, less than 4 bytes) are left in FIFO and the remaining are filled with "FFFFh". The software should initiate a TX transaction only when 128 bits are written in the TX buffer. This field does not set if transfer is less than 128 bits. The application must clear the TX buffer in response to this event by writing a 1 to MCR[CLR_TXF]. The application must clear the TX buffer in response to this event by writing a 1 to MCR[CLR_TXF].
25 —	Reserved
24 —	Reserved
23 ILLINE	Illegal instruction error flag This field is set when an illegal instruction is encountered by the controller in any of the sequences. As soon as the field is set, you must assert MCR[SWRSTSD] and MCR[SWRSTHD]. That is, reset the flash memory and AHB domain after reconfiguring the correct sequence instruction. See Table 696 for a list of legal instructions.
22-21 —	Reserved
20 —	Reserved
19-18 —	Reserved
17 RBOF	RX buffer overflow flag This field is set when no more data can be pushed into the RX buffer from the serial flash memory device. The IP command leading to this condition is continued until the number of bytes in IPCR[IDATSZ] are read from the serial flash memory device. The content of the RX buffer remains unchanged.
16 RBDF	RX buffer drain flag This field is set if SR[RXWE] is asserted. Writing 1 to this field triggers one of the following actions:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• If the RX buffer has up to RBCT[WMRK] valid entries, then the flag is cleared. • If the RX buffer has more than RBCT[WMRK] valid entries and the RSER[RBDDE] field is not set (flag driven mode), an RX buffer POP event is triggered. The flag remains set if the RX buffer contains more than RBCT[WMRK] valid entries after the RX buffer POP event is complete. The flag is cleared if the RX buffer contains less than or equal to RBCT[WMRK] valid entries after the RX buffer POP event is complete. See the "Receive Buffer Drain Interrupt or DMA Request" section in Normal mode interrupt and DMA requests for details.
15 —	Reserved
14 AITEF	AHB illegal transaction error flag This is set whenever there is no response generated from QuadSPI to AHB bus in case of an illegal transaction and the watchdog timer expires. The timer value is considered as a parameter.
13 AIBSEF	AHB illegal burst size error flag This is set whenever the total burst size (size x beat) of an AHB transaction is greater than the prefetch data size, which is defined by BUFxCR[ADATSZ] or data size mentioned in the sequence pointed to by the SEQID field in case ADATSZ = 0. See HBURST support with AHB read details on HBURST feature.
12 ABOF	AHB buffer overflow flag This is set when the size of the AHB access exceeds the size of the AHB buffer. This condition can occur only if BUFxCR[ADATSZ] is programmed incorrectly. The AHB command leading to this condition is continued until the number of entries according to BUFxCR[ADATSZ] have been read from the serial flash memory device. The content of the AHB buffer is not changed.
11 —	Reserved
10 —	Reserved
9 —	Reserved
8 —	Reserved
7 IPAEF	IP command trigger during AHB access error flag This is set when the following condition occurs:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• A write access occurs to IPCR[SEQID] and the SR[AHB_ACC] field is set. Any command leading to the assertion of the IPAEF field is ignored.
6 IPIEF	IP command trigger could not be executed error flag This is set when the SR[IP_ACC] and SR[AWRACC] fields are set (that is, an IP triggered command is currently executing) and any of the following conditions occurs: • Write access to the IPCR. Any command leading to the assertion of the IPIEF flag is ignored. • Write access to the SFAR • Write access to the RBCT
5 —	Reserved
4 —	Reserved
3-1 —	Reserved
0 TFF	IP command transaction finished flag This field is set after the QuadSPI module completes a running IP command. If an error occurs, and the related error flags are valid in the same clock cycle, the TFF flag is asserted.

78.11.2.25 Interrupt and DMA Request Select and Enable Register (RSER)

Offset

Register	Offset
RSER	164h

Function

This register provides enables and selectors for the interrupts in the QuadSPI module.

NOTE

Each field of the FR enabled as source for an interrupt prevents the QuadSPI module from entering the Stop mode or Module Disable mode when this flag is set.

Special write-access is permitted in the "Anytime" mode.

Diagram

78.11.2.26 Sequence Pointer Clear Register (SPTRCLR)

Offset

Register	Offset
SPTRCLR	16Ch

Function

This register provides fields to reset the IP and buffer sequence pointers. The sequence pointer contains the index of instructions within the LUT entry that is to be executed next. For example, if the LUT entry ends on a JMP_ON_CS value of 2, the index is stored as 2.

The software should reset the sequence pointers defined by JMP_ON_CS operand whenever the sequence ID is required to be changed by updating the SEQID field in the IPCR or BFGENCR.

78.11.2.31 RX Buffer Data Register (RBDR0 - RBDR63)

Offset

For a = 0 to 63:

Register	Offset
RBDRa	200h + (a × 4h)

Function

These registers provide access to individual entries in the RX buffer. See Table 698 for the byte ordering scheme.

RBDR0 corresponds to the actual position of the read pointer within the RX buffer. The number of valid entries available depends on the number of RX buffer entries implemented and on the number of valid buffer entries available in the RX buffer.

Example 1 - RX buffer filled completely with 128 words: In this case, the address range for valid read access extends from RBDR0 to RBDR63.

Example 2 - RX buffer filled with five valid words: RX buffer fill level of RBSR[RDBFL] is 5. In this case, access to RBDR4 provides the last valid entry.

Any access beyond the range of valid RX buffer entries provides undefined results.

NOTE

To access data beyond RBDR[63], you must pop the data by using FR[RBDF]. See here for details.

78.11.2.33 LUT Lock Configuration Register (LCKCR)

Offset

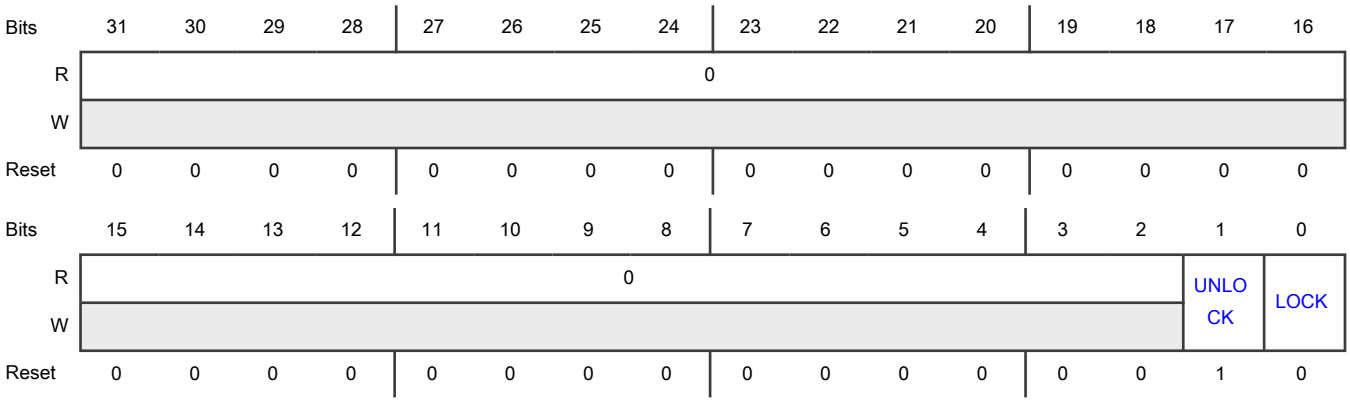
Register	Offset
LCKCR	304h

Function

This register is used along with the LUTKEY register to lock or unlock the LUT. This register should be written immediately after the LUTKEY register for the lock or unlock operation to be successful. See LUT for details. Setting both the LOCK and UNLOCK bits as "00" or "11" is not allowed.

Special write access is permitted after writing the LUT key register.

Diagram



Fields

Field	Function
31-2 —	Reserved
1 UNLOCK	Unlock LUT Unlocks the LUT when the following two conditions are met: • This register is written just after the LUT Key Register (LUTKEY). • The LUT key register was written with the 0x5AF05AF0 key.

Table continues on the next page...

Table continued from the previous page...

Field	Function
0 LOCK	Lock LUT Locks the LUT when the following conditions are met: • This register is written just after the LUT Key Register (LUTKEY). • The LUT key register is written with the 0x5AF05AF0 key.

78.11.2.34 LUT Register (LUT0)

Offset

Register	Offset
LUT0	310h

Function

A sequence of instruction-operand pairs may be pre-populated in the LUT according to the device connected on board. Each instruction-operand pair is of 16 bits (2 bytes) each. Every sequence preprogrammed by Program Sequence Engine in the LUT is referred to by its index. The LUT registers act as lookup tables for sequences of instructions. The programmable sequence engine executes the instructions in these sequences to generate a valid serial flash memory transaction. There are a total of 20 LUT registers. These 20 registers are divided into groups of 5 registers that make a valid sequence. Therefore, LUT[0], LUT[5], LUT[10] ..... LUT[15] are the starting registers of a valid sequence. Each of these sets of 5 registers can have a maximum of 10 instructions. Reset value of the register shown below is only applicable to LUT2 to LUT19. A maximum of 4 sequences can be defined at one time. See LUT that describes the LUT registers in detail.

Special write-access is permitted if the LUT is unlocked.

78.11.2.35 LUT Register (LUT1)

Offset

Register	Offset
LUT1	314h

Function

A sequence of instruction-operand pairs may be pre-populated in the LUT according to the device connected on board. Each instruction-operand pair is of 16 bits (2 bytes) each. Every sequence preprogrammed by Program Sequence Engine in the LUT is referred to by its index. The LUT registers act as lookup tables for sequences of instructions. The programmable sequence engine executes the instructions in these sequences to generate a valid serial flash memory transaction. There are a total of 20 LUT registers. These 20 registers are divided into groups of 5 registers that make a valid sequence. Therefore, LUT[0], LUT[5], LUT[10] ..... LUT[15] are the starting registers of a valid sequence. Each of these sets of 5 registers can have a maximum of 10 instructions. Reset value of the register shown below is only applicable to LUT2 to LUT19. A maximum of 4 sequences can be defined at one time. See LUT that describes the LUT registers in detail.

Special write-access is permitted if the LUT is unlocked.

78.11.3 Serial flash memory address assignment

The serial flash memory address assignment can be modified by writing into Serial Flash Memory A1 Top Address Register (SFA1AD) and Serial Flash Memory A2 Top Address Register (SFA2AD) for device A

Table 718. Serial flash memory address assignment

Parameter	Function	Access mode
QuadSPI_AMBA_BASE ((31:10) - 22 bits)	QuadSPI AHB base address First address of the serial flash memory device as presented to the QuadSPI controller. This might be the base of the serial flash memory in the system address map or it may be a remapping, for instance to 0h, performed by the system. (See the system address map file attached to this document)	
QuadSPI_ARDB_BASE	First address of the QuadSPI Rx buffer on system memory map	
TOP_ADDR_MEMA1(TPADA1)	Top address for the external flash memory A1 (the first of the two independent flash memories sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA1 and QuadSPI_AMBA_BASE is routed to serial flash memory A1.
TOP_ADDR_MEMA2(TPADA2)	Top address for the external flash memory A2 (the second of the two independent flash memories sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA2 and TOP_ADDR_MEMA1 is routed to serial flash memory A2.

78.12 Flash memory mapped AMBA bus

QuadSPI_AMBA_BASE defines the address to be used as the start address of the serial flash memory device, as defined by the system memory map. Note that this may be a remapping of the physical address of the serial flash memory in the system. See the system address map for details.

Table 719. QuadSPI AMBA bus memory map

Address	Register name
QuadSPI_AMBA_BASE to (TOP_ADDR_MEMA2 - 1h)	• See Memory-mapped serial flash memory data—individual flash memory mode on flash memory A. • For information about byte ordering, see Table 698 and Table 699.
QuadSPI_ARDB_BASE to... (32 * 4 Byte) QuadSPI_ARDB_BASE + 1FFh	• See AHB RX Data Buffer Register (ARDB0 - ARDB127). • For information about the byte ordering, see Table 698.

NOTE

Any read access to non-implemented addresses provides undefined results.

In individual flash memory modes, the 3/4 address bytes (as programmed in the instruction/operand in the sequence) available for the flash memory address are determined by SFADR[23:0] or SFADR[31:0] as provided in the table shown above.

78.12.1 AHB bus access read considerations

Note that all logic in the QuadSPI module implementing the AHB bus access is designed to read the content of an external serial flash memory device. Therefore, the following restrictions apply to the QuadSPI module with respect to accesses to the AHB bus:

- Any AHB command resulting in the assertion of the FR[ABSEF] flag is answered with the ERROR condition according to the AMBA_AHB specification. The resulting AHB command is ignored.
- AHB bus read access types—NONSEQ and BUSY—are fully supported.
- AHB read access type—SEQ—is treated in the same way as NONSEQ. See Flash memory mapped AMBA bus for details.
- Early burst termination is not supported for AHB transactions.

78.12.2 Memory-mapped serial flash memory data—individual flash memory mode on flash memory A

Starting with address QuadSPI_AMBA_BASE, the content of the first external serial flash memory device is mapped into the address space of the device containing the QuadSPI module. Serial flash memory byte address 0h corresponds to bus address, QuadSPI_AMBA_BASE, in an increasing order. . See the following table for the address mapping. The byte ordering for 32-bit access is provided in Table 698 and for 64-bit read access, the byte ordering is provided in Table 699.

Table 720. Memory-mapped individual flash memory mode—flash memory A address scheme

Memory-mapped address 32-bit access	Memory-mapped address 64-bit access	Serial flash memory byte address	Flash memory device
QuadSPI_AMBA_BASE + 0h	QuadSPI_AMBA_BASE + 0h	0h to 3h	A1
QuadSPI_AMBA_BASE + 4h		4h to 7h	

Table continues on the next page...

Table 720. Memory-mapped individual flash memory mode—flash memory A address scheme (continued)

Memory-mapped address 32-bit access	Memory-mapped address 64-bit access	Serial flash memory byte address	Flash memory device
...	...	...	
TOP_ADDR_MEMA1 - 8h	TOP_ADDR_MEMA1 - 8h	(TOP_ADDR_MEMA1- 8h) to (TOP_ADDR_MEMA1 - 0h4 -0h1)	
TOP_ADDR_MEMA1 - 4h		(TOP_ADDR_MEMA1 - 4h) to (TOP_ADDR_MEMA1 - 0h1)	
TOP_ADDR_MEMA1 + 4h	TOP_ADDR_MEMA1 + 0h	0h to 3h	A2
TOP_ADDR_MEMA1 + 0h4		4h to 7h	
...	...	...	
TOP_ADDR_MEMA2 - 8h	TOP_ADDR_MEMA2 - 8h	(TOP_ADDR_MEMA2 - 8h) to (TOP_ADDR_MEMA2 - 4h - 1h)	
TOP_ADDR_MEMA2 - 4h		(TOP_ADDR_MEMA2 - 4h) to (TOP_ADDR_MEMA2 - 1h)	

The available address range depends on the size of the external serial flash memory device. Any access beyond the size of the external serial flash memory provides undefined results.

For details concerning the read process, see Flash memory read.

78.12.3 ARDB register descriptions

NOTE

See the system memory map in this document for the base address of the QuadSPI AHB RX data buffer.

78.12.3.1 ARDB memory map

QuadSPI_34x_ARDB base address: 6800_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h - 1FCh	AHB RX Data Buffer Register (ARDB0 - ARDB127)	32	R	0000_0000h

78.12.3.2 AHB RX Data Buffer Register (ARDB0 - ARDB127)

Offset

For a = 0 to 127:

Register	Offset
ARDBa	0h + (a × 4h)

Function

This register is used to read the buffer content of the RX buffer from successive addresses. ARDB0 corresponds to the RX buffer register entry corresponding to the current value of the read pointer in an increasing order.

The increment of the read pointer depends on the access scheme (DMA or flag-driven). See Flash memory read, RX buffer, data read through register interface, and AHB read for the description of successive accesses to the RX buffer content. See Byte Ordering of Serial Flash Memory Read Data for the byte ordering scheme.

Valid address range accessible in the ARDB*n* range depends on the number of RX buffer entries implemented and on the number of valid buffer entries available in the RX buffer.

- Example 1 - RX buffer filled completely with 128 words: In this case, the address range for valid read access extends from ARDB0 to ARDB127.
- Example 2 - RX buffer filled with five valid words; RX buffer fill level RBSR[RDBFL] is 5. In this case, an access to ARDB4 provides the last valid entry.

Quad Serial Peripheral Interface (QuadSPI) for S32K358, S32K348, S32K338, and S32K328

79.1 Chip-specific QuadSPI information

79.1.1 QuadSPI configuration

Table 721. QuadSPI instances

Instance	S32K358/S32K348/S32K338/S32K328
QuadSPI	Yes

Table 722. QuadSPI configuration details

Configuration	S32K358/S32K348/S32K338/S32K328
QuadSPI Tx FIFO size	256 words
QuadSPI Rx FIFO size	32 words
Look Up Table Size	16 words
Rx Buffer	1024 Bytes

For supported data rates, see device Datasheet.

NOTE

Boot from QuadSPI is not supported but execution from external memory is supported.

Table 723. Features supported

Feature	S32K358/S32K348/S32K338/S32K328
AHB Write	Yes
Data learning feature	Yes
DLL	Yes
OTFAD (On-the-fly-AES-decryption engine)	No
DDR mode	Yes
HyperRAM	Yes
HyperFlash	Yes
External DQS (Data Strobe)	Yes
Boot from QuadSPI interface	No

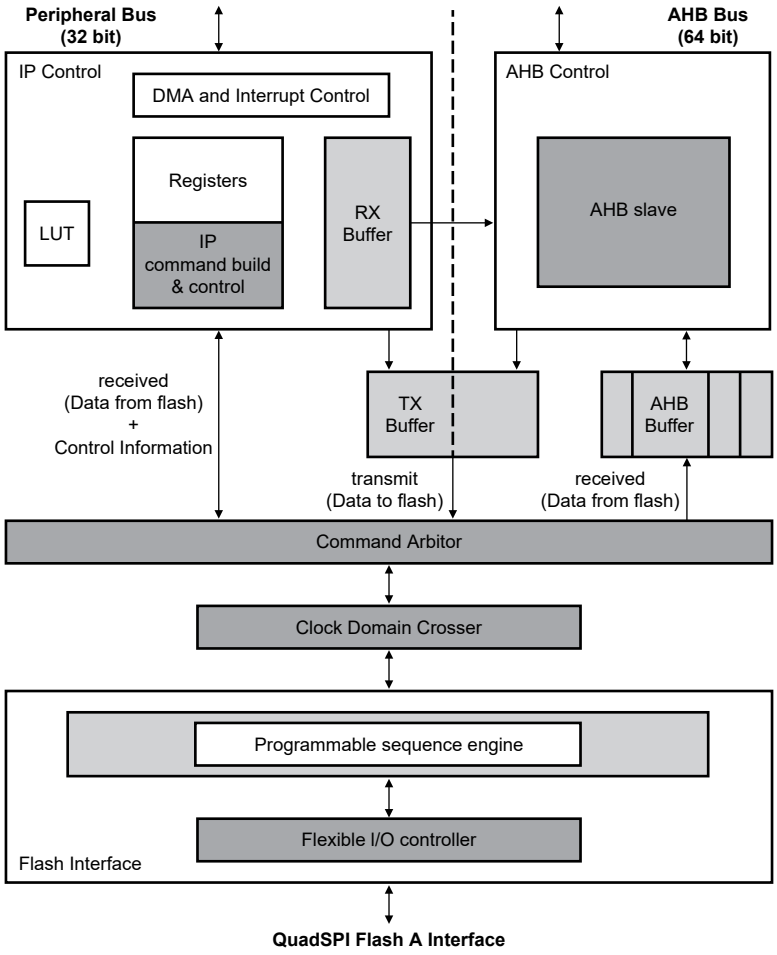

Figure 505. Block diagram

79.1.2 Supported read modes

The table below provides an overview of the QuadSPI read modes.

Table 724. QuadSPI read modes

Read modes		SDR support (QuadSPI_MCR [DDR_EN]=0)	QuadSPI_MCR [DQS_EN]	QuadSPI_MCR [DQS_FA_SEL]	DLL/Data learning support
DQS sampling method	Pad loopback	Yes	1	01	Yes

79.1.3 QuadSPI initialization sequence

Following initialization sequence should be followed for proper QuadSPI operation:

- Enable QuadSPI module by MC_ME peripheral clock enable (register PRTNx_COFBy_CLKEN present within MC_ME). Refer MC_ME chapter for peripheral mapping.
- Configure the SIUL2 registers MSCR[OBE] as 1 and MSCR[SSS] as 0 for QuadSPI_SCKFA pin.
- Initialize QuadSPI SCKFA by writing a sequence of 1010 to the SIUL2 register GPDO[PDO_a] for QuadSPI_SCKFA pin.
- Configure the SIUL2 register MSCR[OBE] back as 0 for the pins.

- Initiate a dummy flash read to reset all DQS flops by itself and any crossing from DQS domain to IPS/AHB is taken care by CDC logic.
- Initiate a peripheral software reset to QuadSPI controller by writing to QuadSPI controller's MCR.
- Post this initialization sequence, the QuadSPI will work in intended deterministic manner.

NOTE

QuadSPI initialization is to be done before using QuadSPI after each functional reset.

79.1.4 Pad clock loopback

This chip supports pad clock loopback. The QuadSPI can be configured to use clock loopback to sample input data. SCK is delayed by the SCK pin output delay, plus the SCK pin input delay using pad loopback, and is configured by setting QuadSPI config registers SOCCR[SOCCFG] and MCR[DQS_FA_SEL]. Enabling the loopback version of SCK can improve the setup time of the input data from the Flash.

For details of these register, see QuadSPI register descriptions.

79.1.5 QuadSPI SOC Configuration register SOCCR[SOCCFG] implementation

The QuadSPI SOC Configuration register QuadSPI_SOCCR[SOCCFG] register is used to control dummy loopback pads and obe_pull_timing_relax_b. Below is the description of it's bits:

Table 725. SOCCR[SOCCFG] implementation

Bit	Description
Bit[0]	obe_pull_timing_relax_b : enables the timing relaxation by pulling obe for pad 1 for half cycle, if 0 then enabled else disabled.
Bit[1]	ibe of QSPIA_SCK_DUMMY pad. 0: Disable input receiver 1: Enable input receiver.
Bit[2]	obe of QSPIA_SCK_DUMMY pad. 0: Disable output driver 1: Enable output driver.
Bit[3]	dse of QSPIA_SCK_DUMMY pad. 0: Disable drive strength 1: Enable drive strength.
Bit[4]	pue of QSPIA_SCK_DUMMY pad. 0: Disable internal pullup or pulldown resistor 1: Enable internal pullup or pulldown resistor.
Bit[5]	pus of QSPIA_SCK_DUMMYpad. 0: Enable internal pulldown resistor if pue is set 1: Enable internal pullup resistor if pue is set.
Bit[6]	sre of QSPIA_SCK_DUMMY pad. 0: Disable slew rate control 1: Enable slew rate control.
Bit[31:7]	Reserved

To Enable the Quadspi dummy PAD loopback use following settings

For Flash-A: MCR[DQS_FB_SEL] = 0x2

SOCCR[SOCCFG] = 0x0000000E (ibe=1, obe=1, dse=1 and sre=0)

NOTE

This SoC does not support dual die flashes. Hence, the signal PCSFA2 from QuadSPI is not used.

79.2 Introduction

The QuadSPI module acts as an interface to a single serial flash memory device, with up to eight bidirectional data lines.

79.2.1 Features

QuadSPI supports the following features:

- Flexible sequence engine to support various flash memory vendor devices. As there is no specific standard, the module supports various kinds of flash memories from different vendors. See Serial flash memory devices for example sequences.
- Single, dual, and quad modes of operation supported for Quad flash memories
- Octal and single IO modes of operation supported for Octal flash memories
- Double Data Rate (DDR)/Double Transfer Rate (DTR) mode in which the data is generated on every edge of the serial flash memory clock
- Flash memory data strobe signal to support data sampling in DDR and Single Data Rate (SDR) mode
- Support for HyperFlash memory
- Support for HyperRAM
- Support for Macronix Octal Data integrity features such as ECC and R/W parity (CRC1)
- AHB master to read RX buffer data through AMBA AHB (64-bit width interface) or IPS registers space (32-bit access) and fill TX buffer via IPS registers space (32-bit access) or using AHB (64-bit width interface)
  - AHB master can be a DMA with a configurable inner loop size
- Multi-master accesses are allowed
  - Flexible and configurable buffer for each master—total available buffer size is 1024 bytes.
- All AHB accesses to flash/RAM memory devices are directly memory mapped to the chip system memory
- Programmable sequence engine to cater to future command/protocol changes and ability to support all existing vendor commands and operations. The software needs to select the corresponding sequence according to the connected flash memory device.
  - Support for all types of addressing

79.2.2 RX buffer push event

To add the valid entries into the RX buffer

By default, each buffer push event adds two entries to the RX buffer because the interface to the serial clock domain is 64 bits in width. Depending on the number of bytes read from the serial flash memory device, it is possible for the very last buffer push event that only one entry is added.

RBSR[RDBFL] is incremented by the number of entries added to the RX buffer.

79.2.3 RX buffer POP event

To remove valid entries from the RX buffer

Each buffer POP event removes (RBCT[WMRK] + 1) valid entries from the buffer. BSR[RDBFL] is decremented by the same number and RBSR[RDCTR] is incremented accordingly.

79.2.4 Block diagram

The following figure shows a block diagram of the QuadSPI module.

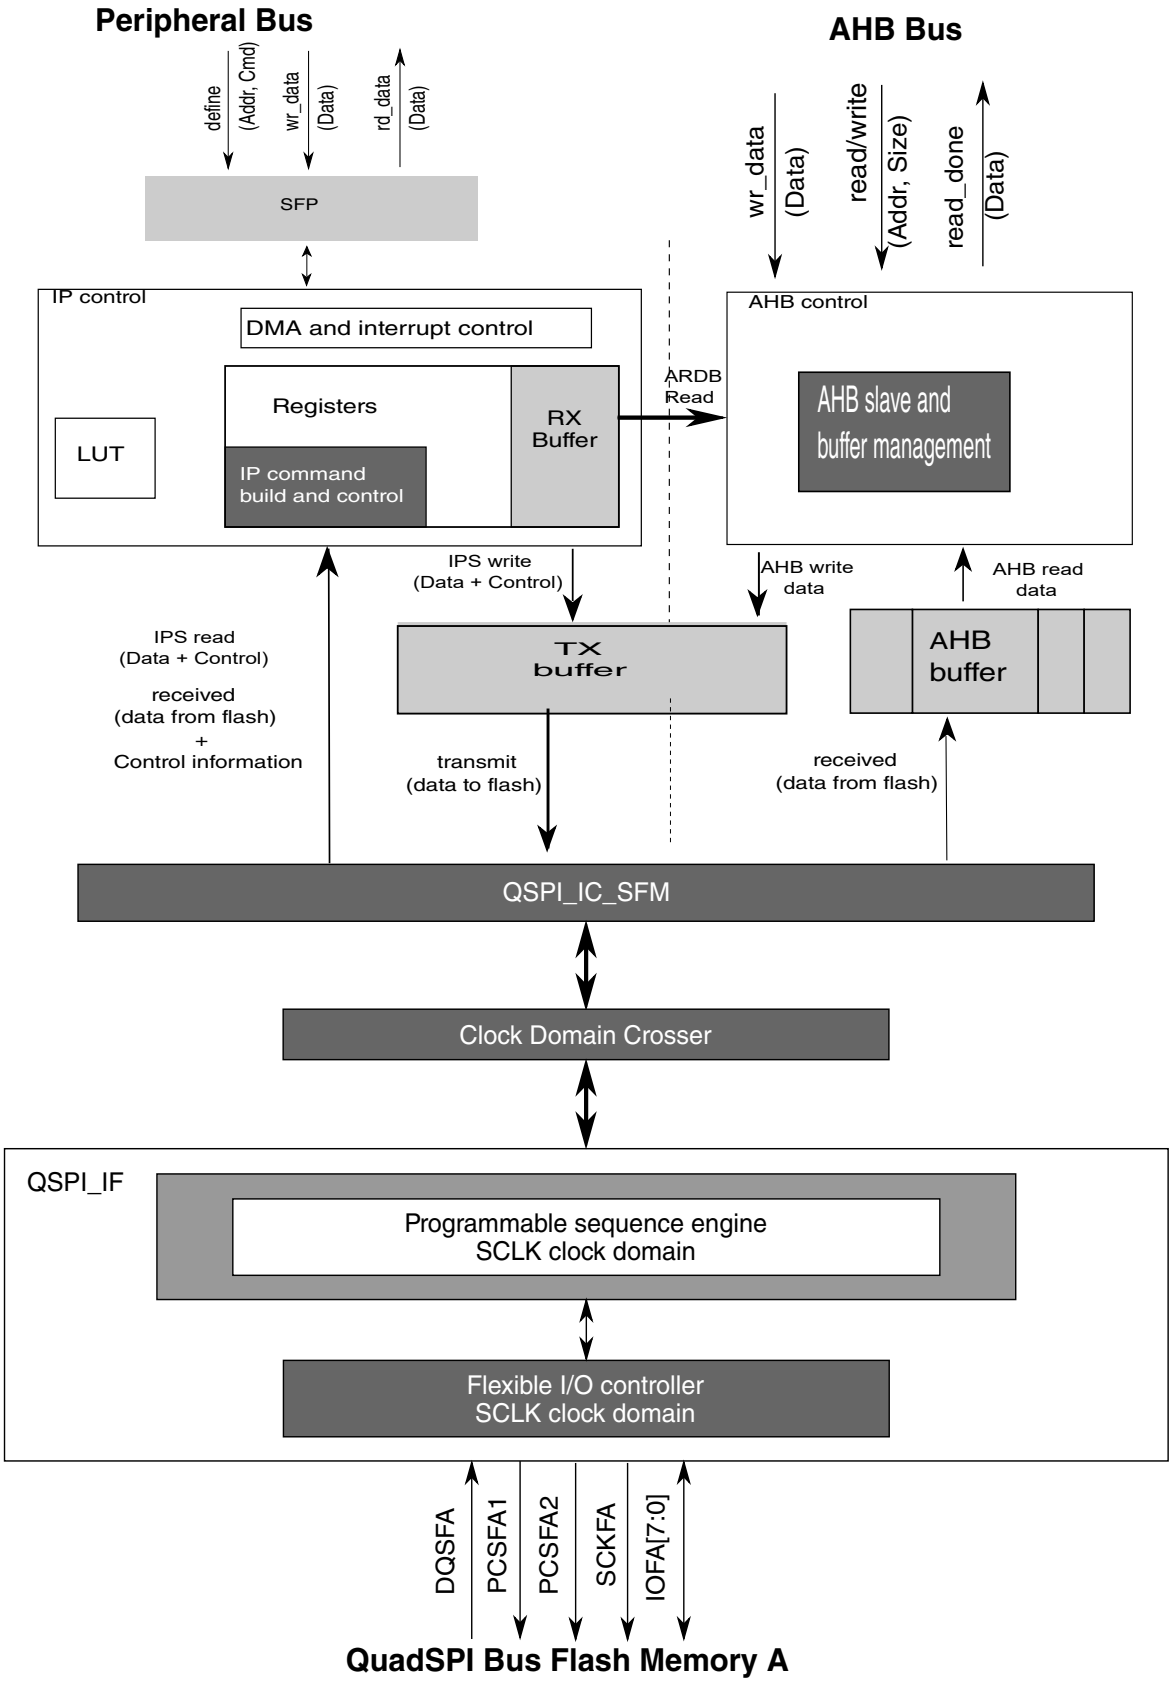

Figure 506. QuadSPI block diagram

79.2.5 QuadSPI modes of operation

QuadSPI supports the following modes of operation:

- Normal mode: You can use this mode for write or read accesses to an external serial flash memory device. See Normal mode for details.
  - Serial flash memory write: You can program data into the flash memory through the IP interface only. See Flash memory programming for details.
  - Serial flash memory read: Read the contents of the serial flash memory device. Two separate read channels are available through the RX buffer and AHB buffer. See Flash memory read for details.
- Module Disable mode: You can use this mode for disabling serial flash memory clock and AHB command. The clock to the non-memory mapped logic in QuadSPI can be stopped in the Module Disable mode. The module enters the mode by setting MCR[MDIS].

79.3 External signal description

This section provides the external signal information for the QuadSPI module.

The following table lists the external signals belonging to the module in conjunction with the different modes of operation.

Table 726. Signal properties

Signal name	Function	Direction	Description
PCSFA1	Peripheral Chip Select Flash Memory A1	O	This signal is the chip select for the serial flash memory device A1 that represents the first of the two flash memory devices that share IOFA.
PCSFA2	Peripheral Chip Select Flash Memory A2	O	This signal is the chip select for the serial flash memory device A2 that represents the second of the two flash memory devices that share IOFA.
SCKFA	Serial Clock Flash Memory A	O	This signal is the serial clock output to the serial flash memory device A.
IOFA[7:0]	Serial I/O Flash memory A	I/O	These signals are the data I/O lines to/from the serial flash memory device A. See Driving external signals for details about the signal drive and timing behavior. Note that the signal pins of the serial flash memory device may change their function according to the SFM Command executed, leaving them as control inputs when single and dual instructions are executed. The module supports driving these inputs to dedicated values. In single I/O mode, QuadSPI drives data on IOFA[0] and expects data on IOFA[1].
DQSFA	Data Strobe signal Flash Memory A	I/O	This is the data strobe signal for port A. Some flash memory vendors provide the Data Read Strobe (DQS) signal to which the read data is aligned in DDR mode. It is also provided as an output signal during write data phase.
INTA	ECC error signal for Flash Memory A	I	Flash Memory A drives this signal to active low value in case of an ECC error.

NOTE

Please refer to chip specific information to check the configuration of QuadSPI block.

79.3.1 Driving external signals

Single/dual/quad/octal instructions

Depending on the serial flash memory device connected to the QuadSPI module, there are instructions using a different number of data lines:

- Single pad: Single line I/O with one data out and one data in line to/from the serial flash memory device
- Dual pad: Dual line I/O with two bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPI module
- Quad pad: Quad line I/O with four bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPImodule
- Octal pad: Octal line I/O with eight bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPI module

The different phases of the serial flash memory access scheme are shown in the following figure.

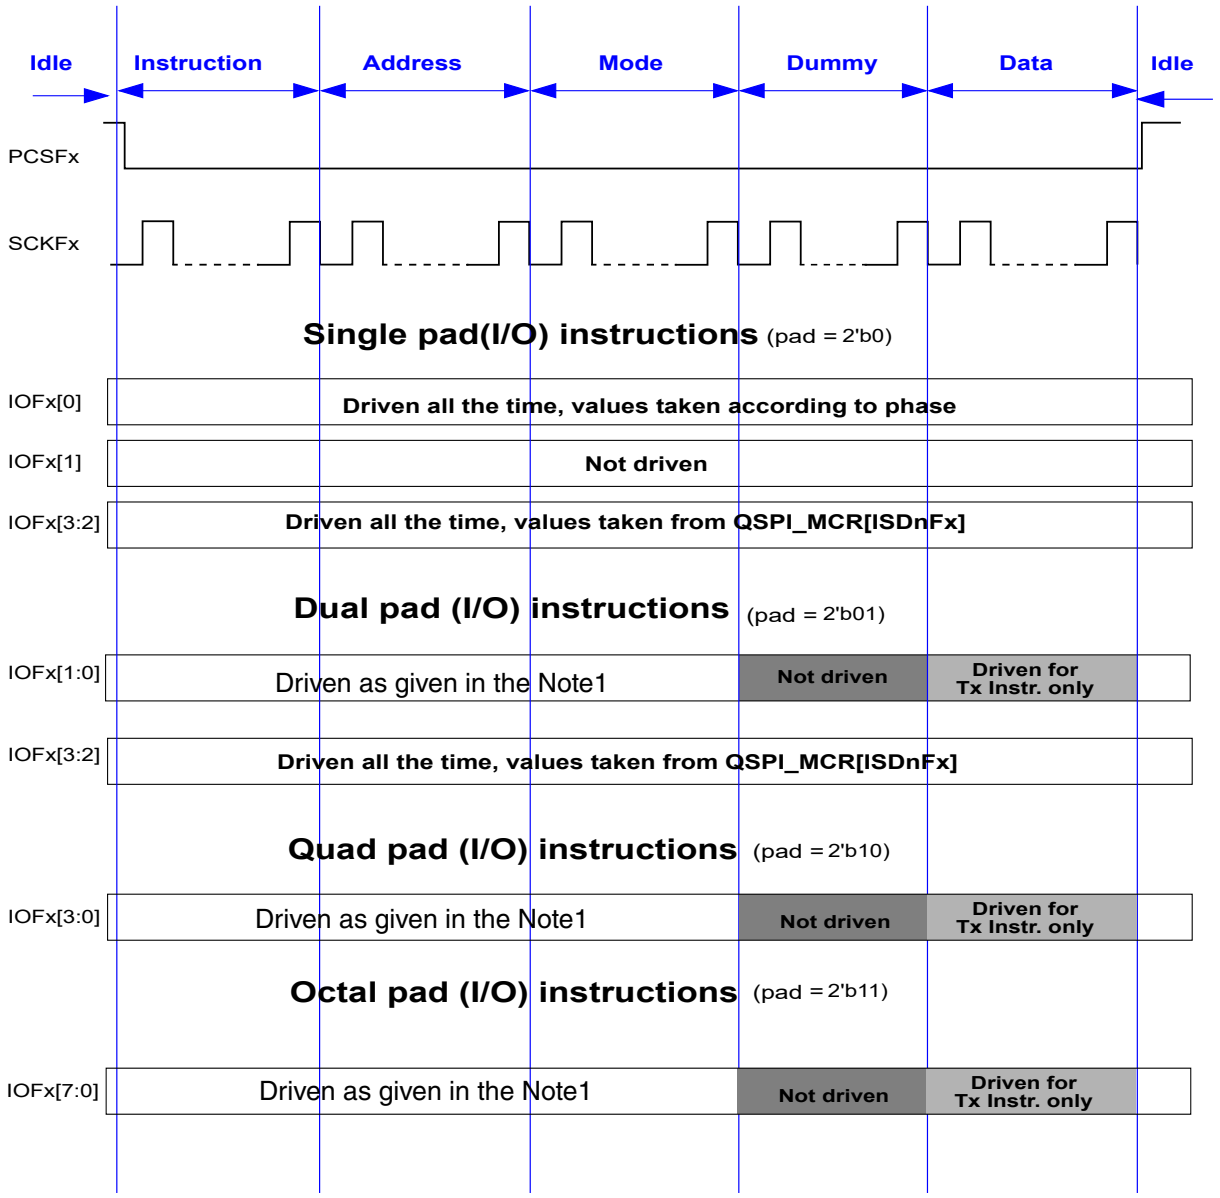

Figure 507. Serial flash memory access scheme

Note1:The IOs are driven from QuadSPI as per the number of pads configured for ongoing phase.

Note:The lines status will change based on command mode in case of instruction, address and mode phases. It can be either 1,2 or 4 lines

Following are the different phases and the I/O driving characteristics of the QuadSPI module:

- Idle: Serial flash memory device not selected – no interaction with the serial flash memory device and the IOFx signals are driven.
- Instruction: Serial flash memory device selected – the instruction is sent to the serial device and all the IOFx signals are driven.
- Address: Serial flash memory address is sent to the device – all the IOFx signals are driven and this phase is not applicable for all SFM commands.
- Mode: Mode bytes are sent to the serial flash memory device – all the IOFx signals are driven and this phase is not applicable for all SFM commands.
- Dummy: Dummy clocks are provided to the serial flash memory device. See Figure 507 for the IOFx signals driven. The actual data lines required for the SFM command executed are not driven for data read commands.

NOTE

— This phase is not applicable for all the SFM commands.

— All read commands in Dual pad, Quad pad /or Octal pad modes must use a Dummy phase immediately before the Data phase. The Dummy phase pad configuration in the LUT must use the same number of pads as the subsequent Data phase. Note that this restriction is not applicable to Single-pad mode.

- Data: Serial flash memory data are sent to or received from the serial flash memory device. See the preceding figure for the IOFx signals driven. The actual data lines required for the SFM command executed are not driven for data read commands.

NOTE

This phase is not applicable for all the SFM commands.

The PCSFx and SCKFx signals are driven permanently throughout all the phases. In the individual flash memory mode, this applies to the selected flash memory device.

Access to a single, individual serial flash memory device

See Serial flash memory access schemes for details.

Read access to two serial flash memory devices attached to the QuadSPI module in parallel. See Serial flash memory access schemes for details.

79.4 Functional description

This section provides a functional description of the QuadSPI module.

79.4.1 Serial flash memory access schemes

In the individual flash memory mode, all supported commands are available.

79.4.2 Normal mode

This mode allows communication with an external serial flash memory device. Compared to the standard SPI protocol, this communication method uses up to eight bidirectional data lines operating at high-data rates. The communication to the external serial flash memory device consists of an instruction code and optional address, mode, dummy, and data transfers. The flexible programmable core engine described below is immune to a wide variety of command or protocol differences in the serial flash memory devices provided by various flash memory vendors.

79.4.2.1 Programmable sequence engine

The core of the QuadSPI module is a programmable sequence engine that works on "instruction-operand" pairs. The core controller executes each programmed instruction sequentially. The complete list of instructions and the corresponding operands are provided in the following table.

Table 727. Instruction set

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
CMD	1d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d- Eight pads	8-bit command value	Provides the serial flash memory with the SFM command operand (Encoded) on the number of pads specified in STR mode.
ADDR	2d		Number of address bits to be sent (for example, 24d => 24 address bits required)	Provide the serial flash memory with address cycles according to the operand on the number of pads specified The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions, if the value of SFACR[CAS] is set to 0. Otherwise, the actual address takes CAS into consideration.
DUMMY	3d		Number of dummy clock cycles (should be <= 64 and > 2 cycles)	Provide the serial flash memory with dummy cycles according the operand The PAD information defines the number of pads in input mode. For example, one pad implies that pad 1 is not driven, rest all are driven. **NOTE** If DLL is enabled and N dummy cycles are needed, you must program two back-to-back DUMMY instructions: DUMMY: N-2 followed by DUMMY:2.
MODE	4d		8-bit mode value	Provide the serial flash memory with 8-bit operand on the number of pads specified
MODE2	5d	N={0,1}d	2-bit mode value	Provide the serial flash memory with 2-bit operand on the number of pads[1] specified
MODE4	6d	N={0,1,2}d	4-bit mode value	Provide the serial flash memory with 4-bit operand on the number of pads[2] specified
READ	7d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d- Eight pads	Read data size in bytes (for AHB transactions, your application should ensure that data size is a multiple of 8 bytes)	Read data from flash memory on the number of pads specified The data size can be overwritten by writing to the ADATSZ field of the BUFxCR registers for AHB-initiated transactions and to the IDATSZ field of the IP Configuration Register (IPCR) for IPS-initiated transactions.
WRITE	8		Write data size in bytes	Write data on the number of pads specified The data size can be overwritten by writing to the IDATSZ field of IP Configuration Register (IPCR).

Table continues on the next page...

Table 727. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
JMP_ON_CS [3]	9d	NA	Instruction number	Every time the CS is deasserted, jump to the instruction pointed to by the operand. This instruction allows the programmer to specify the behavior of the controller when a new read transaction is initiated following a CS deassertion. **NOTE** This instruction is not supported if DLL is enabled.
ADDR_DDR	10d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d- Eight pads	Number of address bits to be sent (for example, 24d => 24 address bits required)	Provide the serial flash memory with address cycles according to the operand on the number of pads specified at each clock edge of serial flash memory clock. The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions if SFACR[CAS] is set to 0. Otherwise, the actual address takes CAS into consideration.
MODE_DDR	11d		8-bit mode value	Provide the serial flash memory with 8-bit operand on the number of pads specified at each clock edge of serial flash memory
MODE2_DDR	12d	N={0}d	2-bit mode value	Provide the serial flash memory with 2-bit operand on the number of pads specified at each clock edge of serial flash memory [4]
MODE4_DDR	13d	N={0,1}d	4-bit mode value	Provide the serial flash memory with 4-bit operand on the number of pads specified at each clock edge of serial flash memory [5].
READ_DDR	14d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d - Eight pads	Read data size in bytes (for AHB transactions, the application should ensure that data size is in multiple of 8 bytes)	Read data from flash memory on the number of pads specified at each clock edge of serial flash memory. The data size might be overwritten by writing to the ADATSZ field of the BUFxCR registers for AHB-initiated transactions and IDATSZ field of IP Configuration Register (IPCR) for IP initiated transactions.
WRITE_DDR	15d		Write data size in bytes	Write data on the number of pads specified at each clock edge of serial flash memory The data size can be overwritten by writing to the IDATSZ field of IP Configuration Register (IPCR).
DATA_LEARN	16d	N={0,1,2,3}d 0d - One pad	Operand[7]-	Find the correct sampling point with the data learning pattern.

Table continues on the next page...

Table 727. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
		1d - Two pads 2d - Four pads 3d- Eight pads	• 1 - DDR mode • 0 - SDR mode Operand[6:0]- • Number of bits to be used for data learning. For example, if operand is 16 then a 16-bit data learning pattern is read and compared.	When this instruction is encountered, the value of Sampling Register (SMPR) is ignored and the controller finds the correct sampling point on its own by sampling the data learning pattern.[6]
CMD_DDR	17d	N={0,1,2,3}d 0d - One pad 1d - Two pads 2d - Four pads 3d- Eight pads	8-bit command value	Provides the serial flash memory with the SFM command operand (Encoded) on the number of pads specified in DTR mode.
CADDR	18d		Number of column address bits to be sent (8d means 8 bits of column address is to be sent)	Provide the serial flash memory with column address cycles according to the operand on the number of pads specified. The actual address to be provided to flash memory depends on the value of SFACR[CAS]. For example, if the value of SFACR[CAS] is 3, then the address to flash memory will be [2:0] of incoming address in case of AHB and the value of SFAR in case of IP. This is appended with 0 if SFACR[CAS] is less than number of pads for a flash memory.
CADDR_DDR	19d		Number of column address bits to be sent(8d means 8 bits of column address is to be sent)	Provide the serial flash memory with column address cycles according to the operand on the number of pads specified at each clock edge of the serial flash memory. The actual address to be provided to flash memory depends on the value of SFACR[CAS]. For example, if CAS is 3, then the address to flash memory will be [2:0] of incoming address in case of AHB and the value of SFAR in case of IP. This is appended with 0 if CAS is less than the number of pads for a flash memory.
JMP_TO_SEQ[3]	20d	NA	Sequence number	Every time CS is deasserted, jump to the LUT sequence is pointed to by the operand. This instruction allows the programmer to join two sequences and initiates the second

Table continues on the next page...

Table 727. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
				flash memory transaction automatically. It can be used to join write-enables with flash memory write or data learn with read. **NOTE** This instruction is not supported if DLL is enabled.
STOP[3]	0d	NA	NA	Stop execution; deassert CS

1. For a one-pad instruction, MODE2 takes two serial flash memory clock cycles on the flash memory interface.
2. For a one-pad instruction, MODE4 takes four serial flash memory clock cycles on the flash memory interface. For a four-pad instruction, MODE4 takes one serial flash memory clock cycle on the flash memory interface.
3. Sequence ending with this instruction must have all remaining bits as 0s after it.
4. For a one-pad instruction, MODE2_DDR takes one serial flash memory clock cycle on the flash memory interface.
5. For a one-pad instruction, MODE4_DDR takes two serial flash memory clock cycles on the flash memory interface. For a four-pad instruction MODE4_DDR takes half a cycle on the serial flash memory interface.
6. It is not recommended to have 0h or FFh as the data learning pattern.

The programmable sequence engine allows you to configure the QuadSPI module according to the serial flash memory connected on board. This flexible structure is compatible with new command or protocol changes from different vendors.

79.4.2.2 Flexible read xAHB buffers

To reduce the latency of the reads for AHB masters, the data read from serial flash memory is buffered in flexible AHB buffers. There are four such flexible buffers. The size of each of these buffers is configurable with the minimum size being 0 bytes and maximum size being the size of the complete buffer instantiated (1024 bytes). The size of buffer 0 ranges from 0 to BUF0IND. The size of buffer 1 ranges from BUF0IND to BUF1IND, buffer2 from BUF1IND to BUF2IND and, buffer 3 ranges from BUF2IND to the size of the complete buffer (1024 bytes).

Each flexible AHB buffer is associated with the following:

- An AHB master: Optionally, buffer3 may be configured as an "all master" buffer by writing 1 to BUF3CR[ALLMST]. When buffer3 is configured in such a way, any access from a master not associated with any other buffer is routed to buffer3.
- A datasize field representing the amount of data to be fetched from the flash memory on every missed access.

The master ID of every incoming request is checked and the data is returned or fetched into the corresponding associated buffer. See the chip-specific QuadSPI information for details about master IDs and their corresponding components. Every missed access to the buffer causes the controller to clear the buffer and fetch the BUFxCR[ADATSZ] amount of data from the serial flash memory. As such, you need not configure the buffer size to be greater than ADATSZ because the locations greater than ADATSZ are never used. For any AHB access, the sequence pointed to by BFGENCR[SEQID] is used for the initiated flash memory transaction. The data is returned to the master as soon as the requested amount is read from the serial flash memory. The controller; however, continues to prefetch the rest of the data in anticipation of a next consecutive request. See Figure 508 that shows flexible AHB buffers.

BFGENCR[SEQID] points to an index of the LUT. See LUT for details.

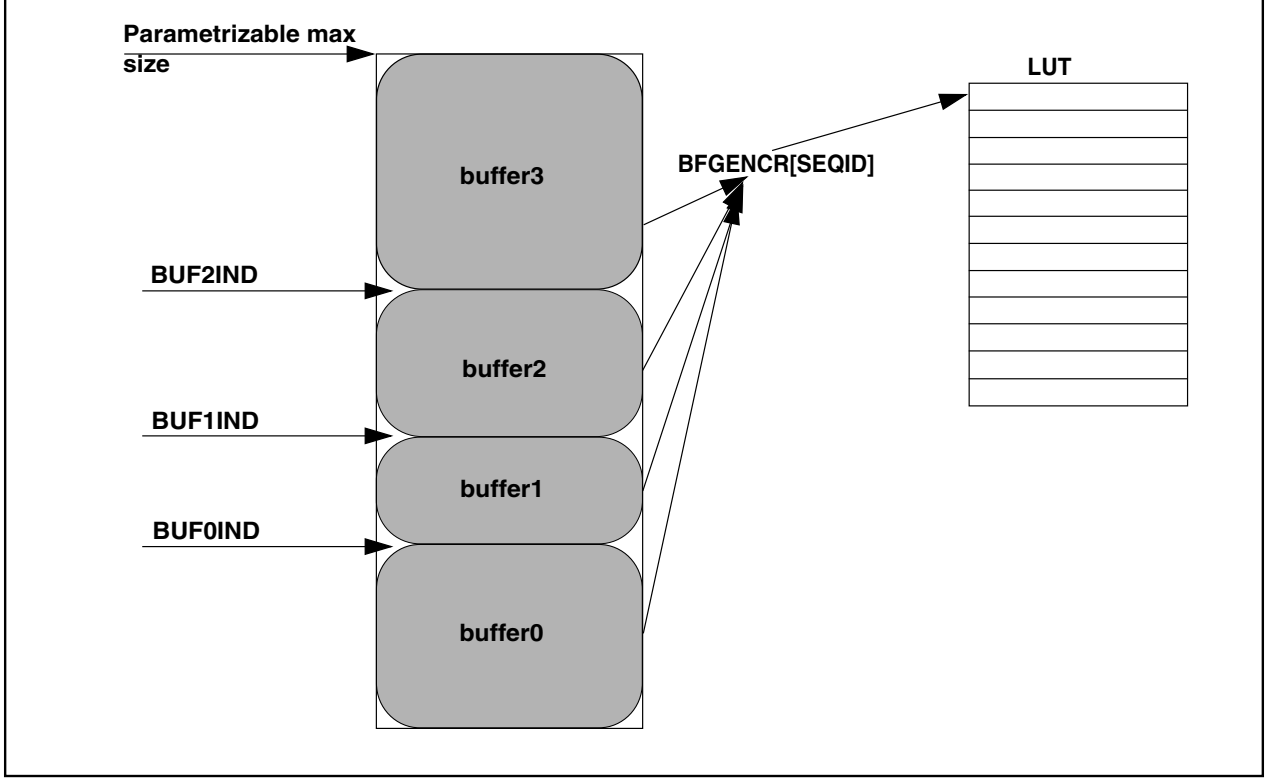

Figure 508. Flexible read AHB buffers

79.4.2.3 Abort mechanism during AHB read

Any ongoing read transaction is aborted if a request from the same master arrives for a location other than the location at which the transaction is going on. The abort can happen at any point of time.

79.4.2.4 HBURST support with AHB read

QuadSPI controller supports HBURST and HSIZE on the AHB read interface. HBURST indicates if the transfer forms part of a burst. Four, eight, and sixteen beat bursts are supported and the bursts might either be incrementing or wrapping. HSIZE indicates the size of the transfer, and supports 8-, 16-, 32-, and 64-bit data sizes. In case of WRAP accesses, QuadSPI generates aligned accesses to serial flash memory if there is no buffer hit for any incoming, non-sequential AHB read access. In case there is a buffer hit, the incoming address in the haddr line is latched as it is. If the total burst size is more than the data prefetch size, an error response is generated and the value of FR[AIBSEF] is configured as 1. The data prefetch size can be defined by BUFxCR[ADATSZ] or data size mentioned in the sequence pointed to by the SEQID field when ADATSZ is programmed as 0. In case of wrap burst, data prefetch size must be greater than or equal to the wrap burst size + 32 bytes. A few examples are shown in the figure below:

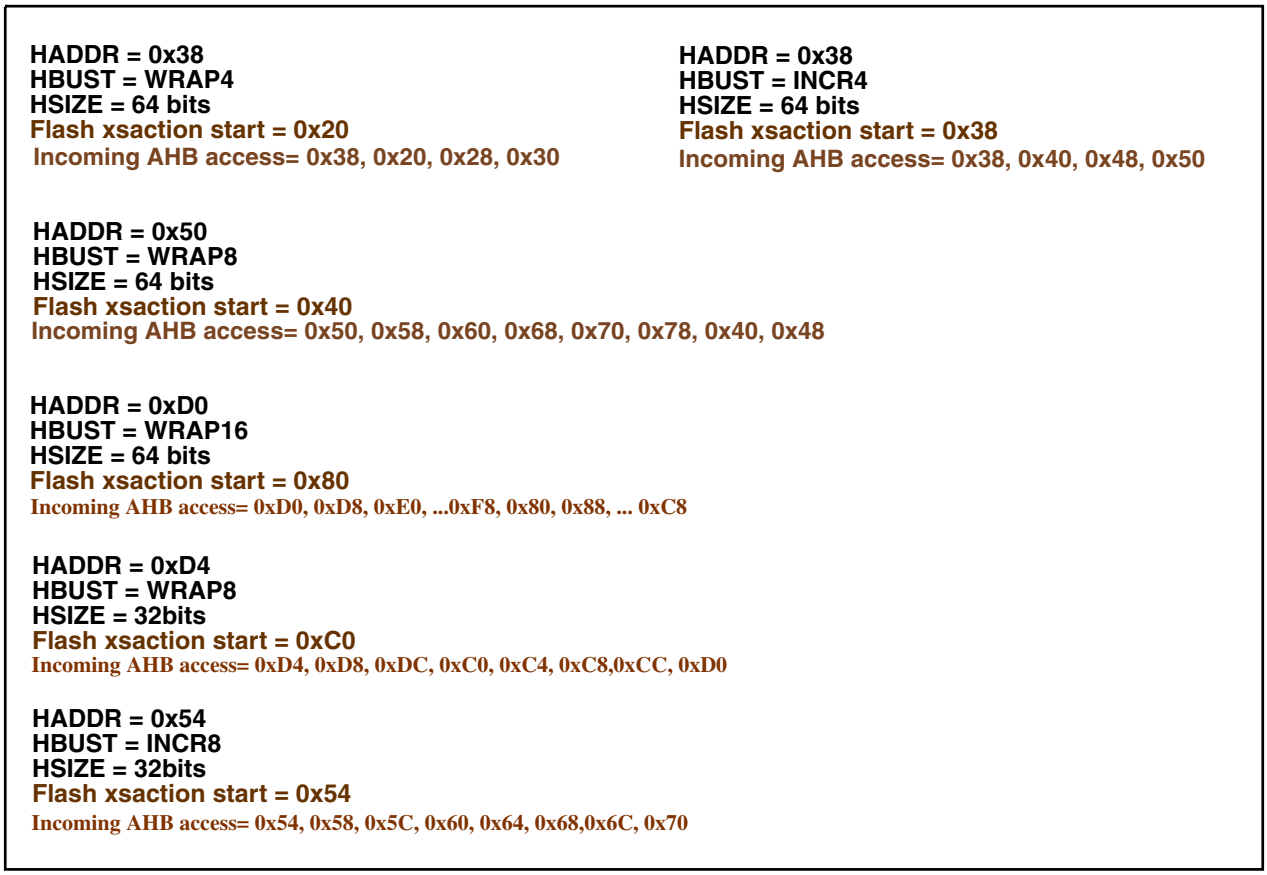

Figure 509. QuadSPI HBURST support

NOTE

The software must take care that the prefetch size should never be set less than the minimum data needed by any external interface to start processing.

NOTE

Whenever a core accesses QuadSPI memory with cache enabled, the prefetch size must be configured as equal or more than the cache line size; otherwise, FR[AIBSEF] error appears.

79.4.2.5 LUT

The LUT consists of a number of pre-programmed sequences. Each sequence is basically a sequence of instruction-operand pairs, which when executed sequentially, generate a valid serial flash memory transaction. Each sequence can have a maximum of 10 instruction-operand pairs. The LUT can hold a maximum of 16 sequences. The figure below shows the basic structure of the sequence in the LUT.

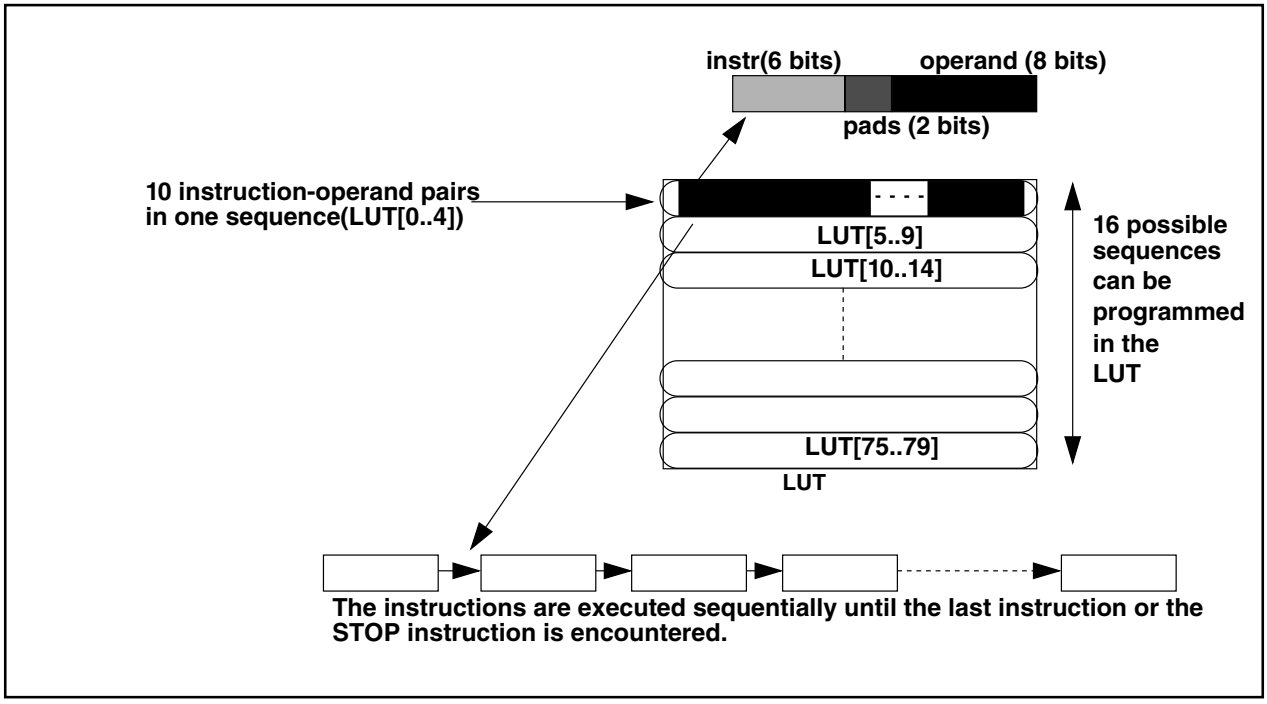

Figure 510. LUT and sequence structure

At reset, the index 0 of the LUT[0..4] is programmed with a basic read sequence as described in Reset sequence. After reset, the complete LUT may be reprogrammed according to the chip connected on board. To protect its contents, during a code runover, the LUT might be locked, after which a write to the LUT will not be successful until it has been unlocked again. The key for locking or unlocking the LUT is 5AF05AF0h, and the associated processes are as follows:

Locking the LUT

1. Write the key 5AF05AF0h into the LUT Key Register (LUTKEY).
2. Write 0b01 to the LUT Lock Configuration Register (LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued). A successful write to this register locks the LUT.

Unlocking the LUT

1. Write the key 5AF05AF0h into the LUT Key Register (LUTKEY).
2. Write 0b10 to the LUT Lock Configuration Register (LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued in between). A successful write to this register unlocks the LUT.

The lock status of the LUT can be read from the LCKCR[UNLOCK] and LCKCR[LOCK] fields.

Some example sequences are defined in Example sequences. After reset the instruction sequence 0 is populated with the default read sequence shown in the table below.

Table 728. Reset sequence

Instruction	Pad	Operand	Comment
CMD	0h	3h	Read data byte command on one pad
ADDR	0h	18h	24 address bits to be sent on one pad

Table continues on the next page...

Table 728. Reset sequence (continued)

Instruction	Pad	Operand	Comment
READ	0h	8h	Read 64 bits
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

79.4.2.6 Issuing SFM commands

Each access to the external device follows this sequence:

1. You must pre-populate the LUT with the serial flash memory command sequences that are required for the flash memory device being used.
2. The module executes the instructions in this sequence one by one. The transaction starts and the module configures the value of SR[BUSY].
3. Communication with the external serial flash memory device starts and the transaction executes.
4. After the transaction is complete (all transmit and receive operations with the external serial flash memory device are complete), the module resets SR[BUSY]. In case of an IP command, FR[TFF] is asserted.

For details, see Flash memory programming and Flash memory read.

You can trigger the processing of SFM commands in the QuadSPI module in one of the following ways:

Using IP commands

For IP commands, the required components need to be written into the following registers and in this sequence:

1. Write the serial flash memory address to be used as provided in the Serial Flash Address Register (SFAR). For IP commands not related to specific addresses, the base address of the related flash memory needs to be programmed. For example, for an instruction which does not require an address (that is, write enable instruction), the SFAR should be programmed with the base address of the memory the command is to be sent to.
2. Write the sequence ID and data size details in the IP Configuration Register (IPCR).
3. Note that writing a value to IPCR[SEQID] must be the last step of the sequence. It is possible to combine all the fields of the IPCR into one single write. See IP Configuration Register (IPCR) for details.

Using AHB commands

Any AHB memory-mapped access is routed to one of the buffers depending on the master ID of the request. If the access is a "miss," a new serial flash memory transaction is initiated. The transaction is based on the sequence pointed to by BFGENCR[SEQID] as described in Flexible read xAHB buffers.

An AHB access is considered memory mapped when the access is to the memory-mapped serial flash memories, as described in Memory Mapped Serial Flash Data - Individual Flash mode on Flash memory A.

79.4.2.7 Flash memory programming

In all NOR Flash devices memory sector to be written needs to be erased first. The programming sequence is then initiated in the following way:

1. Program the FRAD and MDAD registers.
2. Program the address related to the command in SFAR (with access attributes programmed in MDAD). If required, write the desired value to SFACR[CAS], otherwise write 0 to it. Also, write 1 to SFACR[WA] if the serial flash memory is a word addressable flash memory, or write 0 in case serial flash memory is byte addressable

3. Program the IPCR register (with access attributes programmed in MDAD). IPCR[SEQID] should point to an index of the LUT that has the flash memory program sequence pre-programmed. Write an appropriate value to IPCR[IDATSZ] to denote the size of the write in bytes.
4. Check FSM Status (FSMSTAT) register to know status of current transaction. Valid[31] bit should be '1' and domain ID [11:8] should match the ID with which SFAR and IPCR were written. Program the TX watermark in TBCT[WMRK] field and wait for STAT[1:0] bits to turn '01'.
5. Check that the TX buffer is empty. If you need to discard the data present in the TX buffer (SR[TXEDA]) field is set, then the TX buffer must be cleared by writing 1 to MCR[CLR_TXF].
6. Provide data for the program command into the circular buffer through the TBDR. Once the TX buffer is written till watermark level and SR[TXWA] flag is de-asserted this IP command will be triggered. FSMSTAT[STAT] will get set to 10.
7. Repeat step 3, depending on the amount of data required, until all of the required data is written to the TBDR. SR[TXFULL] can be used to check if the buffer is ready to receive more data. At any time, TBSR[TRCTR] can be read to check how many words have been written into the TX buffer.
8. Once the transaction completes FSMSTAT[VLD] bit will set to 0, SR[BUSY] is reset and FR[TFF] is asserted. Please refer to section Secure flash programming for more details.

After writing to IPCR[SEQID] , the module starts executing the programmed sequence when QuadSPI SFM is IDLE. The software ensures that the correct sequence is programmed into the LUT in accordance with the flash memory connected to the module. The data is fetched from the TX buffer. It consists of 256 entries of 32-bit sizes and is organized as a circular FIFO, the read pointer for which is incremented after each fetch. When all the data is transmitted, the QuadSPI module returns from the busy state to the idle state. However, this is not true for the external device because the internal programming is still ongoing. You may monitor the relevant status information available from the serial flash memory device and ensure that the programming is done appropriately.

79.4.2.8 Flash memory read

Host access to the data stored in the external serial flash memory device is performed in two steps. First, the data must be read into the internal buffers and in the second step, these internal buffers can be read by the host.

Reading serial flash memory data into the QuadSPImodule internal buffers

A read access to the external serial flash memory device can be triggered in two different ways:

- IP command read: For reading flash memory data into the RX buffer, you must provide the correct sequence ID in IPCR[SEQID]. The sequence ID points to a sequence in the LUT. The software needs to ensure that a correct read sequence is programmed in the LUT in accordance with the serial flash memory device connected on board. You must program the SFAR , SFACR[CAS], and IPCRs. All available read commands supported by the external serial flash memory are possible.

  Optionally, it is possible to clear the RX buffer pointer prior to triggering the IP command by writing a 1 to MCR[CLR_RXF]. This will invalidate the data currently present in the RX buffer and any new read data will overwrite the old one.

  Using these inputs, the complete transaction is built when IPCR[SEQID] is written to and if MDAD checks are passing (based on the access attributes while writing SFAR and IPCR). The transaction related to the read access starts when QuadSPI is IDLE and FSMSTAT[VLD] bit is 1. The data is fetched for the domain ID that is shown in FSMSTAT[11:8] bits when FSMSTAT[STAT] is set to 11 and the requested number of bytes is fetched from the external serial flash memory device into the RX buffer. As the read access is triggered by an IP command, the value of both SR[IP_ACC] and SR[BUSY] is set to 1.. A count of the number of entries currently in the Rx buffer can be obtained from RBSR[RDBFL].

  Communication with the external serial flash memory stops if the specified number of bytes are read (on successful completion of the transaction).

  NOTE

  In case of external DQS strobe based sampling, read data size (IDATSZ or LUT size) must be in multiples of 8 bytes.

- AHB command read: For reading flash memory data into the AHB buffer, you must:

- Set up a read access by a master to the address range in the system memory map, which the external serial flash memory devices are mapped to.
- Write a desired value to SFACR[CAS], if required, or write 0 to the field.
- Program the buffer registers corresponding to the AHB master initiating the request.
- Provide the correct sequence ID in the BFGENCR. The software ensures that a correct read sequence is programmed in the LUT in accordance with the serial flash memory device connected on board. Flash memory device selection and access mode are determined by the address accessed in the AHB address space associated with the QuadSPI module (see Memory-mapped serial flash memory data—individual flash memory mode on flash memory A

On each AHB read access to the memory mapped area, the valid data in the AHB buffer is checked against the address requested in the actual read. When the AHB read request cannot be served from the content of the AHB buffer, the buffer is flushed and the controller executes the sequence pointed to by the sequence ID. The requested number of buffer entries defined in BUFxCR[ADATSZ] is then fetched from the external serial flash memory device into the internal AHB buffer. As the read access is triggered through the AHB bus, the value of SR[AHB_ACC] is set, driving SR[BUSY] in turn, until the transaction is complete. Communication with the external serial flash memory stops when the specified number of entries is filled.

Data transfer from the QuadSPI module internal buffers

The data read out from the external serial flash memory device by the QuadSPI module is stored in the internal buffers. The means of accessing the data from the buffer differs depending on which buffer the data is loaded to. See Block diagram for details on the two available buffers, the RX buffer and the AHB buffer, in this module. The buffer appears transparent to you and is non-memory mapped. See the "Flexible AHB Buffer" section for details.

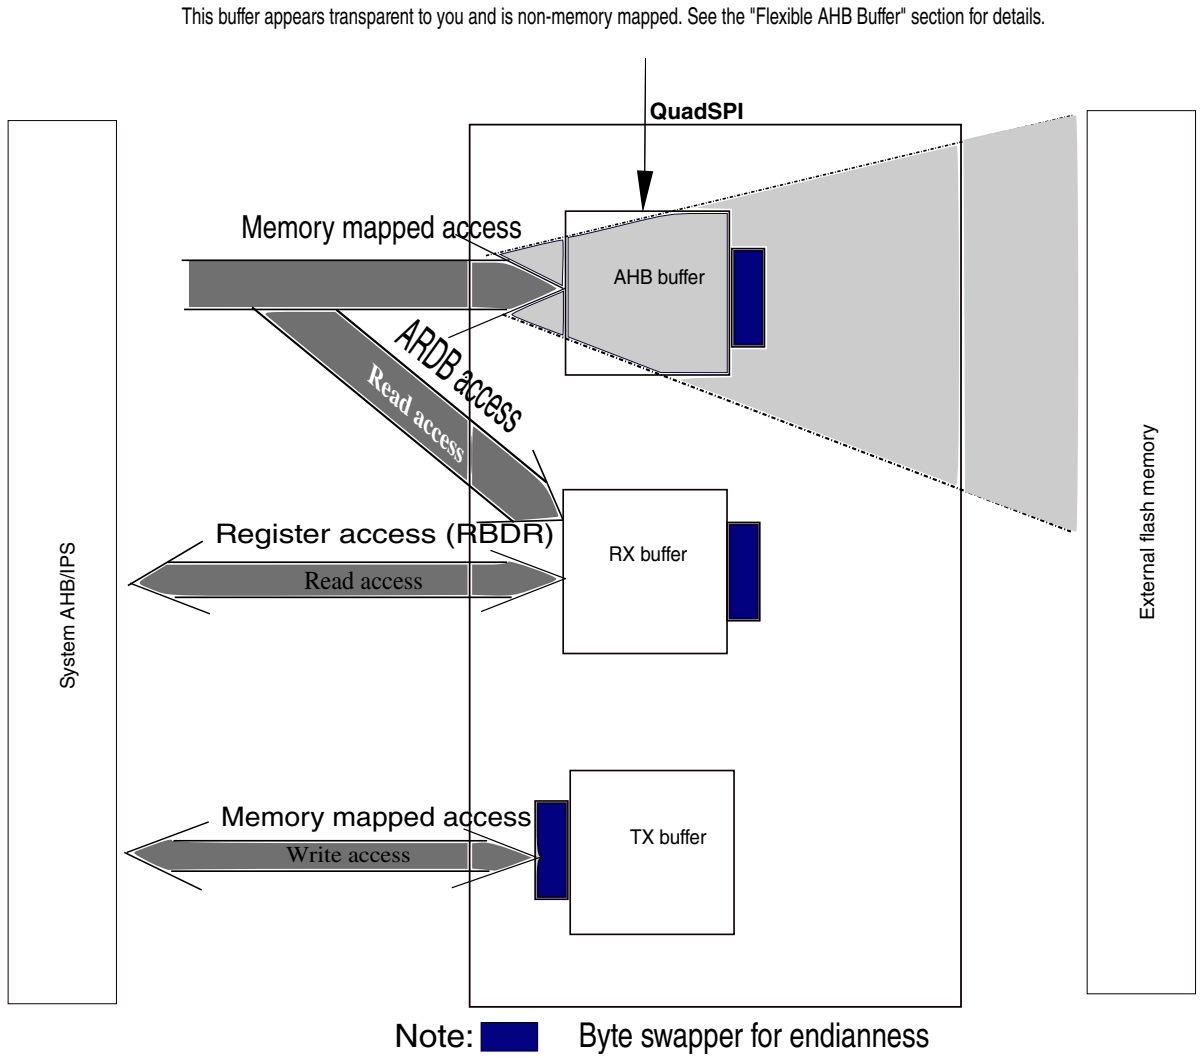

Figure 511. QuadSPI memory map

The RX buffer is implemented as FIFO of depth 32 entries of 4 bytes. Its content is accessible in two different address areas, both referring to identical data and the same physical memory:

- In the IPS address space in the area associated with RX Buffer Data Register (RBDR0 - RBDR31).
- In the AHB address space in the area associated with AHB RX Data Buffer Register (ARDB0 - ARDB31).Two successive entries are accessed with one single 64-bit AHB read operation.

The RX buffer operation can be summarized as follows:

- RBCT[WMRK] determines at which fill level SR[RXWE] is asserted and how many entries are removed from the RX buffer on each buffer POP operation.
- SR[RXWE] indicates that the configured number of data entries is available in the RX buffer and RBSR[RDBFL] indicates how many valid entries are available in total.
- The first entry (RBDR0 or ARDB0) always corresponds to the first valid entry in the RX buffer.

For details, see RX Buffer Data Register (RBDR0 - RBDR31) and AHB RX Data Buffer Register (ARDB0 - ARDB31).

- Flag-based data read of the RX buffer is performed by polling SR[RXWE]. When it is asserted, the valid entries can be read either via the IPS address space (RBDRn) or the AHB address space (ARDBn). A buffer POP operation must be

triggered by the application by writing a 1 to FR[RBDF]. This automatically updates the FIFO to point to the next entry as defined by RBCT[WMRK]. For example, if WMRK is set to 3, then the buffer discards 16 bytes of data.

- DMA-controlled data read of the RX buffer is performed by using the DMA module. The application must ensure that the DMA controller of the related chip is programmed appropriately, as described in DMA usage.
- DMA-controlled read out is triggered fully automatically by the assertion of SR[RXWE]. The related buffer POP operation is also handled completely inside the QuadSPI module. As in the case explained here, accessing the RX buffer content either on RBDRn or ARDBn related addresses is equivalent.
- AHB buffer data read via memory-mapped access: This kind of access is performed by reading one of the addresses assigned to the external serial flash memory device(s) within the range specified in Table 766. If this is not the case, a memory-mapped AHB command read is triggered as described above. If the requested data is already available in the AHB buffer, it is provided directly to the host.

When an AHB access is made to the flash memory mapped address, the data is fetched and returned to the AHB interface. The AHB interface is stalled until the data is fetched. As soon as the data from the requested address is read by the QuadSPI module, the AHB read access is served. Therefore, it is possible to run sequential reads from the AHB buffer at arbitrary speed without the need to monitor any information about the availability of the data. Nevertheless, this access scheme stalls the AHB bus for the time required to read the data from the serial flash memory device. If you know that the access is sequential, a better way is to have a prefetch enabled by programming the value of BUFxCR[ADATSZ] so that the data is fetched into the buffer before the next sequential AHB access.

As long as the host restricts its accesses to the data present in the buffer and to the data currently fetched from the serial flash memory, it is possible to run the host read from the AHB buffer simultaneously with the serial flash memory read into the AHB buffer.

79.4.2.9 AHB write

This module supports a single master AHB write with these burst types — INCR4, INCR8, INCR16, and INCR unspecified 4n bytes and single 4n bytes — and these burst types are supported with all Hsizes. An AHB write transaction size can be expressed in multiples of 4 bytes, and a single transaction must have a minimum of 4 bytes. In case of HyperRAM ,this limitation of minimum 4 bytes is not present. Also unspecified INCR and single transactions are supported without the limitation of 4n bytes in case of HyperRAM.

The following restrictions apply to the QuadSPI module with respect to AHB write transactions:

- AHB transactions of WRAP* types are not supported. For these unsupported access types, the controller returns an error response and does not initiate any flash memory transaction.
- Back to back, fixed address AHB write is not supported.
- Early burst termination is not supported for AHB transactions.

The QuadSPI controller queues back-to-back AHB writes with continuous address and sends them in a single flash memory transaction. However, in case the AHB address of a burst is not in continuous addressing sequence to previous write burst, a new flash memory transaction is initiated.

Following is the programming sequence for an AHB write:

1. Check that SR[BUSY] is deasserted or is 0 and check that the TX buffer is empty. If there is any residue data present in the TX buffer(SR[TXNE]), the buffer must be cleared by writing '1'1 to MCR[CLR_TXF].
2. Based on the type of flash memory device that is used for page programming, AWRCR[PPW_WR_DIS] and AWRCR[PPW_RD_DIS] need to be programmed.

   The default reset value for both the fields is 0 and allows writing to flash memory device assuming a very low T_{pp} (page program wait time) period. This period is very high for most of the flash memory devices. After any write to a flash memory device, the module waits for the write to finish before proceeding further.

   This is controlled by the AWRCR[PPW_WR_DIS] and AWRCR[PPW_RD_DIS] field configurations.
3. Program the BFGENCR[SEQID] to point to the LUT where flash memory write sequence is stored.

4. AHB write master can now enable the transactions to be written to the flash memory. The AHB master must ensure data throughout to avoid underflow.
5. When a flash memory write completes and flash memory CS is deasserted, the software must poll SR[BUSY] for the deasserted value, which is 0. This indicates that the AHB write is complete. In case an underflow has occurred, flash memory CS is deasserted with (SR[TXNE])to know that an AHB write is pending with some residue data in the TX buffer.
6. Whenever flash memory CS is deasserted after an AHB write sequence, FR[PPWF] is set if any of AWRCR[PPW_RD/WR_DIS] is enabled. FR[PPWF] disables any further flash memory read/write based on AWRCR[PPW_RD]/AWRCR[WR_DIS]. After FR[PPWF] is set, it returns every incoming AHB transaction with an error response.
7. The software must clear FR[PPWF] to resume AHB transactions after the expiry of T_{pp} period of flash memory. It can also send IPS read command to the flash memory for checking if T_{pp} is over.
8. The software must ensure that the correct read and write LUT sequences are selected corresponding to the AHB read and write transactions. QuadSPI would malfunction if flash memory read sequence is selected during AHB write or vice versa.

NOTE

An AHB error response occurs in case of AHB write if flash is not able to consume data at the rate master is writing in TX FIFO and TX FIFO eventually becomes full

79.4.2.10 Byte ordering of serial flash memory read data

The basic scheme is that the first byte read out of the serial flash memory device, which is addressed by SFAR[SFADR], corresponds to RBDR0[31:24] for IP command read. Similarly, to send a single byte it should be positioned in TBDR[0:7]. In contrast to that for AHB command read, the bytes are always positioned according to the byte ordering of the AHB bus.

- Byte ordering in individual flash memory mode

  The following table provides the byte ordering scheme of how the byte oriented data space of the serial flash memory device is mapped into one single 32-bit entry of the RX buffer or the AHB buffer. The table is valid within the following context:

  — Flash memory A in individual flash memory mode

  — All AHB data read commands with 32-bit access size

Table 729. Byte ordering in individual flash memory mode

Serial flash memory byte numbering	3	2	1	0
Buffer entry bit position [31:0] (32-bit data width)	[31:24]	[23:16]	[15:8]	[7:0]

NOTE

For IP commands, the read size can be specified as number of bytes. If this number is not a multiple of four, then the last buffer entry is not completely filled with the missing higher numbered bytes at undefined values.

For AHB commands and reads, starting from an address not aligned to 32-bit boundaries, the requested bytes are given at the appropriate positions according to the AMBA AHB specification.

- Buffer entry ordering for 64-bit read access

  For read access via the AHB interface, a 64-bit access is possible. Each 64-bit access reads two 32-bit entries, simultaneously. The ordering of these 32-bit entries within the 64-bit word is provided in the following table.

Table 730. 64-bit read access buffer entry ordering

AHB read data bit position [63:0]	[63:32]	[31:0]
Buffer entry #	Odd (1, 3, 5, ...)	Even (0, 2, 4, ...)

79.4.2.11 Normal mode interrupt and DMA requests

The QuadSPI module has different flags that can only generate interrupt requests and one flag that can generate an interrupt as well as DMA requests. The following table lists the eight conditions. Note that the flags mentioned in the table are associated with the Flag Register (FR).

Table 731. Interrupt and DMA request conditions

Condition	Flag (FR)	DMA
Data learn pattern failure	DLPFF	-
TX buffer fill	TBFF	-
TX buffer underrun	TBUF	-
Illegal instruction error	ILLINE	-
RX buffer drain	RBDF	X
RX buffer overflow	RBOF	-
AHB buffer overflow	ABOF	-
AHB sequence error	ABSEF	-
AHB illegal transaction error	AITEF	-
AHB illegal burst size error	AIBSEF	-
IP command trigger could not be executed error	IPIEF	-
IP command related transaction finished	TFF	-

Each condition has a corresponding field in Flag Register (FR) and a request enable field in DMA Request Select and Enable Register (RSER). FR[RBDF] has separate enable fields for generating IRQ and DMA requests. Note that not all the fields have an individual IRQ line. See the chip's Interrupt Vector table for details.

- Transmit buffer fill interrupt request

  This indicates that the TX buffer can accept new data. The buffer is asserted if FR[TBFF] is asserted and if the value of the corresponding enable field, RSER[TBFIE], is 1. See TX buffer Operation for details on the assertion of FR[TBFF].

  Apart from IRQ, it is possible to handle the TX buffer fill by using the DMA. If the value of RSER[TBFDE] is 1, a DMA request is triggered when the number of available space in the TX buffer is more than the TBCT[WMRK] valid entries and value of SR[TXWA] is set. The application must configure the environment appropriately (for example, the DMA controller) for the DMA transfer.

  In SFP Enabled configurations, program RSER[TBFDE] bit to 1 only when arbitration is won and TBDR access is unlocked after checking STATE field of FSMSTAT register. After TBDR programming is completed by DMA, reset this bit otherwise, QuadSPI SFM state will remain busy and no further IPS accesses can be served by that Target queue.

- Receive buffer drain interrupt or DMA request

  This is derived from FR[RBDF], indicating that the RX buffer of the QuadSPI module has data available from the serial flash memory device to be read by the host. It remains set as long as RBSR[RXWE] is configured. Also, RSER[RBDIE] enables the related IRQ.

  Apart from the IRQ, it is possible to handle the RX buffer drain by using the DMA. If the value of RSER[RBDDE] is 1, a DMA request is triggered when the RX buffer contains more than RBCT[WMRK] valid entries. The application must set the environment appropriately (for example, the DMA controller) for the DMA transfers.

- Buffer overflow/underrun interrupt request

This is a combination of the following fields (all located in the Flag Register (FR) with the related enable bits in the DMA Request Select and Enable Register (RSER)):

- TBUF - TX buffer underrun, enabled by TBUIE
- RBOF - RX buffer overflow, enabled by RBOIE
- ABOF - AHB buffer overflow, enabled by ABOIE
- The transmit buffer underrun indicates that an underrun condition in the TX buffer has occurred. It is generated when a write instruction is triggered whilst the TX buffer is empty and the value of RSER[TBUIE] is 1.
- The receive buffer overflow indicates that an overflow condition in the RX buffer has occurred. It is generated when the RX buffer is full, an additional read transfer attempts to write into the RX buffer, and the value of RSER[RBOIE] is 1.
- The AHB buffer overflow indicates that an overflow condition in the AHB buffer has occurred. It is generated when the AHB buffer is full, an additional read transfer attempts to write into the AHB buffer and the value of RSER[ABOIE] is 1.
- The data from the transfers that generated the individual overflow conditions is ignored.

- Serial flash memory command error interrupt request
- Transaction finished interrupt request

  The IP command transaction finished IRQ indicates the completion of the current IP command. It is triggered by FR[TFF] and is masked by RSER[TFIE].

79.4.2.12 TX buffer operation

The TX buffer provides the data used for page programming. For proper operation, it is required to provide at least one entry in the TX buffer prior to starting the execution of the page programming command. The application must ensure that the required number of data bytes is written into the TX buffer fast enough as long as the command is executed without a TX buffer overflow or underrun.

The QuadSPI module sets the FR[TBFF] field as long as the TX buffer is not full and can accept more data. At the end of write through TX buffer, you must clear FR[TBFF] to avoid unnecessary last TX buffer fill interrupt. However, there would always be a pending request asserted from QuadSPI controller at the end of any DMA transfer. When external DMA finishes transfer iteration, this request from QuadSPI is kept asserted for the next iteration loop.

NOTE

Even if the generation of DMA requests for filling the TX buffer is disabled by using RSER[TBFDE], the TX buffer still accepts a DMA transfer because of the last asserted pending request.

Disabling of DMA transfer should be controlled by an external DMA master.

When the QuadSPI module tries to pull data out of an empty TX buffer, FR[TBUB] signals the TX buffer underrun. The TX buffer underrun flag is also asserted when the TX buffer contains less than 32-bits of data and the QuadSPI module tries to pull out data from it. The current IP command leading to the underrun condition is continued until the specified number of bytes is sent to the serial flash memory device. Also, the data that is transferred is in the Fs format. This means, after the underrun flag is set under this condition, it returns Fs until the required number of bytes are not sent. This has been done to ensure that the software does not erase the whole sector after underrun and just reprogramming from failure point serves the purpose. When this sequence command is complete, FR[TBFF] is asserted, indicating that the TX buffer is ready to be written again.

The TX buffer overflow is not signaled explicitly, but TBSR[TRBFL] can monitor the TX buffer fill level.

For more information, see TX Buffer Status Register (TBSR) and Flag Register (FR).

79.4.2.13 Address scheme

Earlier, serial flash memories supported only a 24-bit address space, restricting the maximum memory size of the serial flash memory to 16 MB. The new memory specification supports two types of 32-bit addressing mode in addition to the legacy 24-bit address mode. It also supports segregation of address programmed into Row address and Column address of the flash memory, as per the requirement.

Extended address mode

In this mode, the legacy 24-bit commands are converted to accept 32-bit address commands. The flash memory needs to be configured for the 32-bit address mode. Also, while programming the LUT sequence in QuadSPI for 32-bit mode, the ADDR and ADDR_DDR commands should be programmed with 32d as the operand value with SFACR[CAS] programmed to 0. If a flash memory needs some bits of the address as its column address, then it must be considered that a total of 12 bits are required by the flash memory; however, the number of bits should not exceed 32 because the maximum address supported by QuadSPI is 32 bits.. Each of the memory vendors have a different way of enabling this mode (see the memory specification from memory vendors). For example, the command B7h sent to the Macronix flash memory enables it for the 32-bit address mode.

Extended address register

In this mode, the upper 8 bits of the 32-bit register are provided by the Extended address register in the memory, which provides a specific register that is updated according to the address to be accessed. This effectively converts the legacy 24-bit address command into 32-bit address commands. The memories greater in size than 16 MB consist of banks of 16 MB each. The 8 bits occupied in the extended address register effectively enable a bank. For example, in Spansion memory, when the extended address register is updated with a value of 1h, with the help of the 17h command, it opens Bank1 of the memory. The consequent 24-bit address commands lead to Bank1. The extended address register needs to be updated with the respective value for access to other banks. This effectively converts the legacy 24-bit address command into 32-bit address commands.

Separation of address into rows and columns

This mode has been introduced for flash memories that need addresses segregated into rows and columns. The value in SFACR[CAS] defines the width of the column address required by a flash memory. The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions, if the value of SFACR[CAS] is 0. Otherwise, the actual address takes CAS into consideration. If the value of SFACR[CAS] is 3, then bits 26-3 of the programmed address are sent to the flash memory as its page address. This is in case the flash memory is operating in a 24-bit mode and bits 2-0 are sent as its column address. If a flash memory requirement for column address is less than the number of pads in which address has to be sent, then QuadSPI appends the remaining bits by 0. You must program the operand value in CADDR and CADDR_DDR command accordingly. It must be ensured that the total number of address bits requested by flash memory as its page and column address must not be more than 32 bits.

Word addressable mode for flash memory

This mode has been introduced for flash memories, which have a word-addressable memory. This means, each address of the flash memory contains one word (two bytes) of data. The value of SFACR [WA] is configured to 1 to enter this mode. QuadSPI internally divides the incoming address in the AHB bus or the address in the SFAR to map it to a valid flash memory location. For example, if the incoming address is 2004h, the controller re-maps this address to access the flash memory location 1002h. If not in this mode, the incoming address 2004h is mapped to flash memory location 2004h.

79.4.3 Module Disable mode

Module Disable mode is a block-specific mode that the QuadSPI can enter to disable serial flash memory clock and AHB command. This mode can be entered by:

- The host software: by writing a '1' to MCR[MDIS]

Below are the condition that must be fulfilled to enter the Module Disable mode:

- SR[BUSY] = 0
- SR[AHBTRN] = 0
- RBSR[RDBFL] = 0
- SR[RXDMA] = 0
- SR[TXDMA] = 0
- None of the flags in FR are enabled as interrupts is set

The conditions mentioned above ensures the following:

- There is no SFM command currently being executed.
- All the data read into the RX buffer from the serial flash memory have been fetched by the application.

- There is no current AHB access.
- There is no active DMA request.
- There is no enabled interrupt that is pending.

Certain read or write operations have a different effect when the QuadSPI is in the Module Disable mode. In the Module Disable mode, not all of the status and flag bits of the QuadSPI module are updated, and writing to them has no effect. Interrupt and DMA request signals cannot be cleared while in the Module Disable mode.

NOTE

It is illegal to issue a new SFM command starting two clock cycles prior to raising the request of entering the Module Disable mode until the QuadSPI stays in this mode.

79.4.4 Leaving Module Disable mode

In the Module Disable mode, the serial flash memory clock and AHB command to the QuadSPI module are switched off.

After the QuadSPI has left this mode and has returned to Normal mode, the execution of the first SFM command is deferred until the clock to drive that part of the module related to the serial flash memory device is available. Depending upon the point in time when the first SFM command is triggered, the actual execution of the command starts with a delay, respective with the re-enabling of the flash memory clock signal.

79.4.5 HyperRAM support

QuadSPI supports HyperRAM memories, and by virtue of this protocol, QuadSPI supports the following functionalities.

- Bidirectional data strobe/read write data strobe (RWDS)
  - If QuadSPI is configured to use the HyperRAM mode, the RWDS pad should be pulled down.
- Variable refresh latency
  - If the value of MCR[VAR_LAT_EN] is 1, based on the status of RWDS from HyperRAM during the command/address phase, QuadSPI includes an additional initial access latency. If RWDS is high, QuadSPI includes twice + 1 the latency mentioned in the dummy phase. If RWDS is low, latency mentioned in the dummy phase is not included.
  - If the value of MCR[VAR_LAT_EN] is not set, fixed latency mentioned in the dummy phase is included.
- Read data strobe to latch data from HyperRAM
- Programming considerations for HyperRAM support:
  - Data masking during the AHB write is enabled when MCR[DQS_OUT_EN] bit is programmed as ’1’.
  - It is suggested that while using Hyper RAM program the SPTRCLR[PREFETCH_DIS] bit as ‘1’ so that every time a new AHB read transaction starts it reads new data from external memory instead of reading the data already stored in AHB buffers. This will ensure that the data read back after an AHB write is not a stale data.
  - AHB write doesn’t supports wrap transactions (WRAP4, WRAP8, WRAP16) even with HyperRAM.
  - If there is multiple switching between AHB read and write transactions then software should program AWRCR[AWTRGLVL] cautiously. It should ensure that during AHB write the data written to memory is more than the AWRCR[AWTRGLVL] programmed before switching over to AHB read transactions. This will ensure that IP is not left waiting for sufficient write data to be collected.

79.5 Initialization/application information

This section provides the initialization and application information of the QuadSPI module.

79.5.1 Power up and reset

The serial flash memory devices connected to the QuadSPI module might require special voltage characteristics of their inputs during power up or reset. The application must ensure this.

CAUTION

Erase or program commands should be completed before issuing a reset or power cycle to avoid corrupted flash pages. The application shall ensure there is a backup of critical data stored at a different location to enable recovery from corrupted flash pages.

Example: Flash reset sequence

Use the following sequence to reset flash A:

1. Make sure that the flash supports a reset for the condition CS#=high and IOF[3]=low.
2. Set MCR[SWRSTSD] and MCR[SWRSTHD] fields and then clear them.
3. Set MCR[MDIS] field.
4. Reset MCR[ISD3FA] field for flash A.
5. Clear MCR[MDIS] field.
6. Set MCR[MDIS] field.
7. Set MCR[ISD3FA] field for flash A.
8. Clear MCR[MDIS] field.

79.5.2 Available status/flag information

This section provides an overview of the different flags and statuses available, and their interdependencies for different use cases. The SR and FR are the related registers.

79.5.2.1 IP commands

See IP Configuration Register (IPCR) for additional details not explicitly covered in this paragraph.

- IP commands—normal operation

  Writing to IPCR[SEQID] triggers the execution of a new IP command. Given that this is a legal command, SR[IPACC] and SR[BUSY] are asserted simultaneously, immediately after the execution starts.

  After the instruction on the serial flash memory device is complete, these field deassert and FR[TFF] is configured.

- IP commands—error situations

  See Overview_of_Error_Flags for details.

79.5.2.2 AHB commands

See the "Reading serial flash memory data into the QuadSPI module internal buffers" topic in theFlash Memory Read section for details.

- AHB commands—normal operation

  Memory-mapped read access to a serial flash memory address not contained in the AHB buffer triggers the execution of an AHB command. Given that this is a legal command, SR[AHB_ACC] and SR[BUSY] are asserted simultaneously, immediately after the execution starts. After the instruction on the serial flash memory device is complete, these fields are deasserted.

- IP commands—error situations

  See Overview of FR error flags for details.

79.5.2.3 SFM commands

An SFM command consists of an instruction code and all other parameters (for example, size or mode bytes) needed for that specific instruction code. Triggering a command either initiates a transaction on the external serial flash memory or results in an error. See Table 732 for details on errors.

79.5.2.4 Overview of error flags

The following table provides an overview of the different error flags in the FR and additional error-related details.

Table 732. Overview of FR error flags

Error category	Error flag in FR	Command execution on serial flash memory device TFF behavior (in case of IP commands only)	Description
AHB error flag	ABOF	Flash memory transaction continues until it finishes	Set when the module tries to push data into the AHB buffer that exceeds the size of the AHB buffer. Occurs only because of the wrong programming of BUFxCR[ADATSZ].
AHB error flag	AIBSEF	Flash memory transaction is aborted	Total burst size of the AHB transaction is greater than prefetch data size.
AHB error flag	AITEF	Flash memory transaction is aborted	No response is generated from QuadSPI to AHB bus in case of illegal transaction. Also, the watchdog timer expires.
Miscellaneous error flag	DLPFF	Flash memory transaction continues until it finishes	Set when the DATA_LEARN instruction is encountered in a sequence but no sampling point is found for the data learning pattern.
Miscellaneous error flag	ILLINE	Flash memory transaction aborted	Illegal instruction error flag - set when an illegal instruction is encountered by the controller in any of the sequences.
Command arbitration error	IPIEF	TFF not asserted in conjunction with that command	IP command error - caused when IP access is currently in progress (IP_ACC is set) and during: • Write attempt to RBCT register
Buffer-related error	RBOF	TFF is asserted on completion	• RX buffer overrun
Buffer-related error	TBUF	TFF is asserted on completion	• TX buffer underrun

Note that only the buffer-related errors are associated with a transaction on the external serial flash memory. All the other errors do not trigger an actual transaction.

79.5.2.5 IP bus and AHB access command collisions

There are following flags related to this topic: FR[IPIEF]. See the "Reading serial flash memory data into the QuadSPI module internal buffers" topic of the Flash Memory read section for a description of the flags.

79.5.3 Flash memory device selection

Regardless of the SFM command (IP or AHB), the access mode is selected by specifying the 32-bit address value for the following SFM command.

For IP commands, the access mode is selected with the address programmed into the SFAR register. See Serial Flash Address Register (SFAR) for details.

For AHB commands, the access mode is determined by the memory-mapped address. See AMBA Bus Register Memory Map for details.

79.5.4 DMA usage

For a complete description of the DMA module, see the related DMA Controller chapter. This section only provides QuadSPI-specific DMA usage details.

79.5.4.1 DMA usage in normal mode

79.5.4.1.1 Bandwidth considerations

Careful consideration of the throughput rate of the entire chain (serial flash memory -> AHB bus / IP bus -> DMA controller) involved in the read/write data process is essential for a proper operation. Such analysis must take into account not only the data rate provided by the serial flash memory but also the data rate of the AHB bus and the performance of the DMA controller in reading/writing data from/to the RX/TX buffer.

Two figures must match for a proper operation, which means that the data rate provided by the serial flash memory device must not exceed the average RX buffer readout data rate. Otherwise, the longer this state persists, it results into an RX buffer overflow. Similarly, the data consumed by the serial flash memory device must not exceed the average TX buffer fill rate. If this persists, it leads to an underrun.

AHB bus side (data read)

The total number of bus cycles for each DMA minor loop completion is added from the following components:

The following table provides certain examples for typical use cases:

Case 1: DMA needs to read 4 bytes from SRAM and provide to QuadSPI. It costs total four bus clock cycles. Then, DMA handshake adds additional six bus clock cycles, resulting in a total of [6 + 4 * (32/4) = 38] bus clock cycles.

Table 733. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 60 MHz bus clock frequency
3	16	6+(16/4)*4 = 22	~366ns
7	32	6+(32/4)*4 = 38	~633ns
11	48	6+(48/4)*4 = 54	~900ns
15	64	6+(64/4)*4 = 70	~1166ns

Case 2: DMA needs to read 32 bytes from SRAM and provide to QuadSPI. DMA handshake takes an additional six bus cycles, with 32 bytes DMA read from SRAM costs (8 + 3) core clock cycles. DMA writes 32 bytes to QuadSPI, takes 2 * (32/4) = 16 bus cycles with one additional CPU access to QuadSPI, costing two bus clock cycles. This results in a total 6 + (8+3)/2 + 2 * (32/4) +2 = 30 bus clock cycles.

Table 734. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop >	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 80 MHz bus clock frequency
3	16	6 + (4+3) /2 + (16/4)*2 + 2 = 20	~333ns
7	32	6 + (8+3) /2 + (32/4)*2 + 2 = 30	~500ns
11	48	6 + (4+3)/2*3 + (48/4)*2 + 2 = 44	~733ns
15	64	6 + (8+3) + (64/4)*2 + 2 = 51	~810ns

NOTE

This table figure represents an ideal scenario; actual performance depends on how the chip integrates DMA and QuadSPI modules.

Serial flash memory device side (data read)

The number of serial flash memory cycles can be determined in the following way:

- Number of serial flash memory clock cycles is required to read 4 bytes, corresponding to one RX buffer entry (setup of command and address not considered): , two cycles for the Octal DDR mode in the individual flash memory mode, eight cycles for quad mode (SDR) instructions in individual flash memory mode, and so on.
- Overhead because of clock domain crossing: one cycle

The following table lists the number of clock cycles required to read the data from the serial flash memory corresponding to the different settings of RBCT[WMRK]:

Table 735. Access duration examples for serial flash memory side

RBCT[WMRK] setting	Num bytes per DMA loop [1]	Num SCKFx for 80 MHz SCKFx		Time duration of flash memory data readout for 80 MHz SCKFx (~12.5ns period)	
		IFM [2] quad	IFM quad DDR	IFM quad	IFM quad DDR
0	4	8	4	~100ns	~50ns
1	8	16	8	~200ns	~100ns
3	16	32	16	~400ns	~200ns
7	32	64	32	~800ns	~400ns
11	48	96	48	~1200ns	~600ns

1. DMA loop refers to one minor loop completion that is equivalent to one major loop iteration.
2. Individual flash memory mode

NOTE

The table figure represents an ideal scenario; actual performance depends on how the chip integrates with DMA and QuadSPI modules.

A complementary example is when the watermark is set to be too high. In such a case, the time taken by the DMA to read out the RX buffer entries should be lesser than the time taken by the controller to push in the remaining entries in the buffer.

IPS bus side (data write)

The total number of bus cycles for each DMA minor loop completion are added from the following components:

- Overhead for each minor loop, given by DMA controller: assume 10 cycles
- Overhead because to clock domain crossing: assume two cycles
- Number of bus clock cycles required for 16 bytes (128-bit write size): assume four cycles (read/write sequence of DMA controller)

Note that the size of the minor loop is determined by the size of TBCT[WMRK]; therefore, the overhead specified above distributes among (TBCT[WMRK]+1) write accesses of 32-bit each.

The following table provides some examples for typical use cases:

Table 736. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop [1]	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 80 MHz bus clock frequency
3	16	12+4 = 16	~200ns
7	32	12+8 = 20	~250ns

1. DMA loop refers to one minor loop completion that is equivalent to one.

NOTE

The table figure represents an ideal scenario; actual performance depends on how the chip integrates with DMA and QuadSPI modules.

Serial flash memory device side (data write)

The number of serial flash memory cycles can be determined in the following way:

- Number of serial flash memory clock cycles required to write 16 bytes, corresponding to four TX buffer entry (setup of command and address not considered): Eight cycles for Octal DDR mode instructions in individual flash memory mode, 32 cycles for quad SDR writes in individual flash memory mode.
- Overhead due to clock domain crossing: one cycle

The following table lists the number of clock cycles required to read the data from the serial flash memory corresponding to the different settings of TBCT[WMRK]:

Table 737. Access duration examples for serial flash memory side

TBCT[WMRK] setting	Num bytes per DMA loop [1]	Num SCKFx		Time duration for consuming data at flash memory interface 100 MHz SCKFx (10 ns period)[2]		Time for FIFO to get empty[3]	
		IFM [4] quad	IFM octal DDR	IFM quad	IFM octal DDR	IFM quad	IFM octal DDR
3	16	32	8	320ns	80ns	2240ns	560ns
7	32	64	16	640ns	160ns	1920ns	480ns

1. DMA loop refers to one minor loop completion that is equivalent to one major loop iteration.
2. Not all flash memory devices support writes at 100 MH. See the flash memory data sheet for the actual page program frequency supported.
3. The assumption for these timings is that the TX Fifo is full when the transaction is initiated
4. Individual flash memory mode

NOTE

The tables mentioned above are only examples which must be correlated with the DMA in the system.

Considering the examples provided in the two tables above for TX FIFO, it is evident that depending on the relationship between the bus clock and serial flash memory clock frequencies, there are settings possible where the serial flash memory consumes data faster than the IPS bus can write data in TX buffer. In these cases, a TX buffer underrun situation occurs. To avoid TX buffer underrun, the data transaction size should be large enough.

79.5.5 Flash memory devices address mapping

QuadSPI is configured in Single mode for the supported flash memory port A

The sizes of the flash memory devices are mapped with the system memory space based on the configurations of the following registers:

- SFA1AD
- SFA2AD

The total memory region for the flash memory devices is mapped between QuadSPI_AMBA_BASE and TOP_ADDR_MEMA2 such that the corresponding CS is asserted based on SFA1AD and SFA2AD register configurations.

79.5.5.1 Single mode

For single-die flash memories, you must write the same value to SFA2AD register that you write to the SFA1AD register.

Following is a programming example for single mode single-die flash memory:

- QuadSPI_AMBA_BASE - 1000_0000h
- SFA1AD[TPADA1] - 2000_0000h
- SFA2AD[TPADA2] - 2000_0000h

The following figure illustrates the memory mapping for single mode QuadSPI configuration.

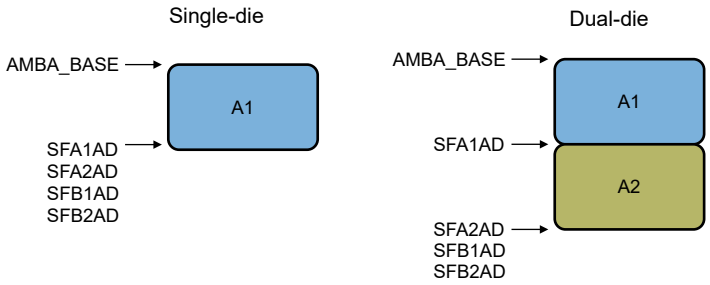

Figure 512. Memory map for Single mode

79.6 Byte ordering – endianness

The following topics show the byte ordering in 64-bit LE configuration for AHB buffer and 32-bit LE for TX/RX buffer.

79.6.1 Programming flash memory data

CPU writes instructions to the TBDR register, such as:

- Write TBDR: 4_03_02_01h
- Write TBDR: 8_07_06_05h

The following table shows the content against each TX buffer entry.

Table 738. Example of QuadSPI TX buffer

TX buffer entry	Content
0	4_03_02_01h
1	8_07_06_05h

Programming the TX buffer into the external serial flash memory device results in the following byte order to be sent to the serial flash memory:

- 01...02...03...04...05...06...07...08

79.6.2 Reading flash memory data into the RX buffer

Reading the content from the same address provides the following sequence of bytes, identical to the write case:

- 01...02...03...04...05...06...07...08

The following table shows the content against each TX buffer entry.

Table 739. Resulting RX buffer content

RX buffer entry	Content
0	4_03_02_01h
1	8_07_06_05h

79.6.2.1 Readout of the RX buffer through RBDRn

The RX buffer content appears at CPU read access through the peripheral bus interface in the following order:

- Read RBDR0: 4_03_02_01h
- Read RBDR1: 8_07_06_05h

79.6.2.2 Readout of the RX buffer through ARDBn

The RX buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- 32-bit access: Read ARDB0: 4_03_02_01h
- 32-bit access: Read ARDB1: 8_07_06_05h
- 64-bit access: Read ARDB0: 8_07_06_05_04_03_02_01h

79.6.3 Reading flash memory data into the AHB buffer

Reading the content from the same address as it was written to provides the following sequence of bytes, identical to the write case:

- 01...02...03...04...05...06...07...08

The following table shows the content against each TX buffer entry.

Table 740. Resulting AHB buffer content

AHB buffer entry	Content
0	8_07_06_05_04_03_02_01h

79.6.3.1 Readout of the AHB buffer through memory-mapped read

The AHB buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- 32-bit read access: 4_03_02_01h
- 32-bit read access: 8_07_06_05h
- 64-bit read access: 8_07_06_05_04_03_02_01h

79.7 Driving flash memory control signals in single and dual modes

In single and dual modes, the serial flash memory devices that can connect to the QuadSPI module expect additional control signals on the inputs, which are connected to IOFA[3], IOFA[2] in the quad mode. For easy interfacing, the outputs IOFA[3:2] for flash memory A are driven to the logic state given by the configuration fields MCR[ISD3FA], MCR[ISD2FA].

These outputs are driven all the time to the logic level programmed in the MCR except the time when quad commands of the serial flash memory are executed. See the specifications of the related serial flash memory device for details about the inactive level.

79.8 Serial flash memory devices

Several different vendors make flash memory devices with a QuadSPI interface. At present, there is no set standard for the QuadSPI instruction set. The most common commands currently have the same instruction code for all vendors; however, some commands are unique to specific vendors. Some of the example sequences are provided in the following sections.

79.8.1 Example sequences

This section provides the example sequences of the QuadSPI module.

Table 741. Exit 4 x I/O read enhance performance mode (XIP) (Macronix) and read status

Instruction	Pad	Operand	Description
CMD	0h	EBh	4xIO read command
ADDR	2h	18h	24-bit address to be sent on four pads
MODE	2h	0h	2 mode cycles (exit XIP)
DUMMY	2h	4h	4 dummy cycles
READ	2h	8h	Read 64 bits
CMD	0h	5h	Read Status register
READ	0h	1h	Status register data
STOP	0h	0h	Stop, instruction over

79.8.1.1 Read command (hyperflash memory/HyperRAM)

This section provides the read command sequences (hyperflash memory/HyperRAM) of the QuadSPI module.

Table 742. Read command (hyperflash memory/HyperRAM)

Instruction	Pad	Operand	Comment
CMD_DDR	3h	A0h	Read command with continuous burst type
ADDR_DDR	3h	18h	24-bit row address

Table continues on the next page...

Table 742. Read command (hyperflash memory/HyperRAM) (continued)

CADDR_DDR	3h	10h	16-bit column address with lower 3 bits valid and rest 0
Dummy	3h	0hF	15 dummy cycles
READ_DDR	3h	4h	32-bit data read on 8 pads
STOP	3h	0h	Stop, instruction over

Hyperflash memory/HyperRAM is a word addressable flash memory. This means that each address accesses a word-wide (two-byte) data value. The software should ensure that when Hyperflash memory/HyperRAM is connected to the controller, the value of SFACR[WA] must be 1. With this value, the controller remaps a byte addressable access to a word addressable access.

79.8.1.2 Read status register (hyperflash memory/HyperRAM)

This section provides details related to the read status register of the QuadSPI module.

Table 743. Read status register (hyperflash memory/HyperRAM)

Instruction	Instruction sequence	Pad	Operand	Description
CMD_DDR	Read Pre Command	3h	0h	Write command with wrapped burst type
ADDR_DDR		3h	18h	24-bit row address (0000AAh)
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits valid and rest 0(0005h) treated as command
CMD_DDR		3h	0h	Write command with wrapped burst type
CMD_DDR		3h	70h	Write data to be sent to flash memory as pre-command
CMD_DDR	Command phase (fourth/final chip select phase)	3h	A0h	Read command with continuous burst type
ADDR_DDR		3h	18h	24-bit row address
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits as valid and rest 0
DUMMY		3h	0hF	15 dummy cycles
READ_DDR		3h	4h	32-bit data read on 8 pads
STOP		3h	0h	Stop, instruction over

79.8.1.3 Word program (hyperflash memory/HyperRAM)

This section provides the word program (hyperflash memory/HyperRAM) of the QuadSPI module.

Table 744. Word program (hyperflash memory/HyperRAM)

Instruction	Instruction sequence	Pad	Operand	Description
CMD_DDR	Unlock sequence 1 (first chip select phase)	3h	0h	Write command with wrapped burst type
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	AAh	8-bit address AAh treated as command
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits valid and rest 0(0005h) treated as command
CMD_DDR		3h	0h	Write command with wrapped burst type
CMD_DDR		3h	AAh	Write data to be sent to flash memory as pre-command
CMD_DDR	Unlock sequence 2 (second chip select phase)	3h	0h	Write command with wrapped burst type
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	55h	8-bit address 55h treated as command
CADDR_DDR		3h	10h	16-bit column address with lower 3-bits valid and rest 0(0002h) treated as command
CMD_DDR		3h	0h	Write command with wrapped burst type
CMD_DDR		3h	55h	Write data to be sent to flash memory as pre-command
CMD_DDR	Program setup phase (third chip select phase)	3h	0h	Write command with wrapped burst type
CMD_DDR		3h	0h	8-bit address 00h treated as command
CMD_DDR		3h	0h	8-bit address 00h treated as command

Table continues on the next page...

Table 744. Word program (hyperflash memory/HyperRAM) (continued)

CMD_DDR		3h	AAh	8-bit address AAh treated as command
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits valid and rest 0(0005h) treated as command
CMD_DDR		3h	0h	Write command with wrapped burst type
CMD_DDR		3h	A0h	Write data to be sent to flash memory as pre-command
CMD_DDR	Command phase (fourth/final chip select phase)	3h	0h	Write command with wrapped burst type
ADDR_DDR		3h	18h	24-bit row address
CADDR_DDR		3h	10h	16-bit column address with lower 3 bits as valid and rest as 0
WRITE_DDR		3h	2h	2-byte data written on 8 pads (D1D2)
STOP		3h	0h	Stop, instruction over

79.8.1.4 Fast read sequence (Macronix/Numonyx/Spansion/Winbond)

The following table shows the fast read sequence for Macronix/Numonyx/Spansion/Winbond flash memories.

Table 745. Fast read sequence

Instruction	Pad	Operand	Description
CMD	0h	Bh	Fast read command = 0Bh
ADDR	0h	18h	24 address bits to be sent on one pad
DUMMY	0h	8h	Eight dummy cycles
READ	0h	4h	Read 32 bits on one pad
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

79.8.1.5 Fast dual I/O DT read sequence (Macronix)

The following table shows the fast dual I/O DT read sequence for Macronix flash memories.

Table 746. Fast dual I/O DT read sequence

Instruction	Pad	Operand	Description
CMD	0h	BDh	Fast dual I/O DT read command = BDh
ADDR_DDR	1h	18h	24 address bits to be sent on two pads in the DDR mode
MODE4_DDR	1h	0h	P2=P0 or P3=P1 is necessary. See the Macronix data sheet for details. One clock cycle for mode.
DUMMY	1h	6h	Six dummy cycles
READ_DDR	1h	4h	Read 32 bits on two pads in the DDR mode
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

79.8.1.6 Fast read quad output (Winbond)

The following table shows the fast read quad output sequence for Winbond memories

Table 747. Fast read quad output sequence

Instruction	Pad	Operand	Description
CMD	0h	6Bh	Fast read quad output command = 6Bh
ADDR	0h	18h	24 address bits to be sent on one pad
DUMMY	2h	8h	Eight dummy cycles
READ	2h	4h	Read 32 bits on four pads
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

79.8.1.7 4 x I/O read enhance performance mode (XIP) (Macronix)

The following table shows the 4 x I/O read enhance performance mode for Macronix flash memories. The enhanced performance mode is also known as XIP mode.

Table 748. Fast read quad output sequence

Instruction	Pad	Operand	Description
CMD	0h	EBh	4xI/O read command = EBh

Table continues on the next page...

Table 748. Fast read quad output sequence (continued)

Instruction	Pad	Operand	Description
ADDR	2h	18h	24 address bits to be sent on four pads
MODE	2h	A5h	Two mode cycles
DUMMY	2h	4h	Four dummy cycles
READ	2h	4h	Read 32 bits on four pads
JMP_ON_CS	0h	1h	Jump to instruction 1 (ADDR)

When in XIP mode, the software must ensure that all the flash memories connected to the controller are in this mode. As a part of initializing the controller, all the flash memories might be enabled with XIP by carrying out dummy reads.

79.8.1.8 Dual command page program (Numonyx)

The following table shows the dual command page program sequence for Numonyx flash memories.

Table 749. Dual command page program sequence

Instruction	Pad	Operand	Description
CMD	1h	2h	Dual command page program = 02h on 2 pads
ADDR	1h	18h	24 address bits to be sent on two pads
WRITE	1h	20h	Write 32 bytes on two pads
STOP	0h	0h	Stop, instruction over

79.8.1.9 Sector erase (Macronix/Numonyx/Spansion)

The following table shows the Sector erase sequence for the Macronix/Numonyx/Spansion flash memories.

Table 750. Sector erase sequence

Instruction	Pad	Operand	Description
CMD	0h	20h	Sector erase command = 20h
ADDR	0h	18h	24 address bits to be sent on one pad
STOP	0h	0h	Stop, instruction over

79.8.1.10 Read status register (Macronix/Numonyx/Spansion/Winbond)

The following table shows the read status register sequence for Macronix/Numonyx/Spansion/Winbond flash memories.

Table 751. Read status register sequence

Instruction	Pad	Operand	Description
CMD	0h	0h5	Read status register command = 05h
READ	0h	0h1	Read status register data
STOP	0h	0h	Stop, instruction over

79.8.1.11 Data learn instruction sequence

The following table shows the data learn sequence for 4 I/O flash memory.

Table 752. Data learn instruction sequence (4 I/O)

Instruction	Pad	Operand	Description
CMD	0h	6Bh	Fast read quad command = 6Bh
ADDR_DDR	2h	18h	24 address bits in the DDR mode to be sent on four pads
DUMMY	2h	8h	8-cycle dummy
DATA_LEARN	2h	1h	1-byte data learn
READ_DDR	2h	6h	Read 6 bytes in 4 pads[1]
JMP_ON_CS	0h	0h	Jump to Inst 0 (CMD)

1. Data learn instruction needs to be followed by a read DDR instruction of minimum 6 bytes in case of 4 I/O mode.

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

The following table shows the data learn sequence for 8 I/O (hyperflash memory) flash memory.

Table 753. Data learn instruction sequence (8 I/O)

Instruction	Pad	Operand	Description
CMD_DDR	3h	AOh	Read command for hyperflash memory
ADDR_DDR	3h	18h	24-bit row address[1]
CADDR_DDR	3h	10h	16-bit column address
DUMMY	3h	Fh	15-cycle dummy
DATA_LEARN	3h	1h	1-byte data learn
READ_DDR	3h	Ch	Read 12 bytes in 8 pads[2]
STOP	3h	0h	Stop, instruction over

1. The address needs to be aligned, which means, no latency should be there between the RWDS edges.
2. The data learn instruction needs to be followed by a read DDR instruction of minimum 12 bytes in case of 8 I/O mode.

The following table shows the data learn sequence for 4 I/O flash memory.

Table 754. Data learn instruction sequence (4 I/O)

Instruction	Pad	Operand	Description
CMD	0h	6Bh	Fast read quad command = 6Bh
ADDR_DDR	2h	18h	24 address bits in DDR mode to be sent on four pads
DUMMY	2h	8h	8 dummy cycles
DATA_LEARN	2h	1h	1-byte data learn
READ_DDR	2h	6h	Read 6 bytes in 4 pads
JMP_ON_CS	0h	0h	Jump to Inst 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

The following table shows the data learn sequence for 8 I/O (Hyperflash) flash memory.

Table 755. Data learn instruction sequence (8 I/O)

Instruction	Pad	Operand	Description
CMD_DDR	3h	AOh	Read command for hyperflash memory
ADDR_DDR	3h	18h	24-bit row address[1]
CADDR_DDR	3h	10h	16-bit column address
DUMMY	3h	Fh	15-cycle dummy
DATA_LEARN	3h	1h	1-byte data learn
READ_DDR	3h	8h	Read 8 bytes in 8 pads
STOP	3h	0h	Stop, instruction over

1. The address needs to be aligned, which means, no latency should be there between the RWDS edges.

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

79.9 Sampling of serial flash memory input data

79.9.1 Basic description

QuadSPI is used to read data from the serial flash memory device. Depending on the actual implementation, there is a delay between the internal clocking in the QuadSPI module and the external serial flash memory device. See the following figure for an overview of this scheme.

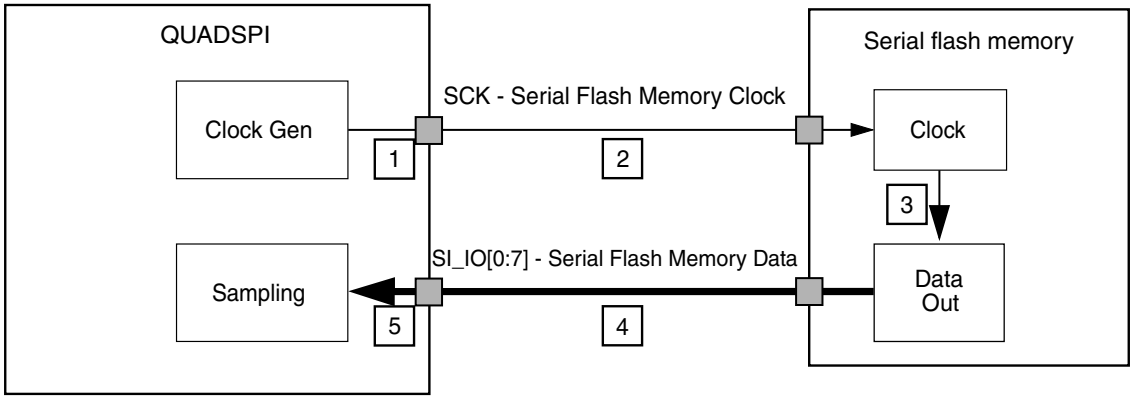

Figure 513. Serial flash memory sampling clock overview

The rising edge of the internal reference clock is taken as timing reference for the data output of the serial flash memory. After a time of t_{total_delay} the data arrives at the internal sampling stage of the QuadSPI module. Considering the figure provided here, the following parts of the delay chain contribute to t_{total_delay}:

- Output delay of the serial flash memory clock output of the device containing the QuadSPI module
- Wire delay of application/PCB from the device containing the QuadSPI module to the external serial flash memory device
- Clock to data out delay of the external serial flash memory device, including input and output delays
- Wire delay of application/PCB from the external serial flash memory device to the device containing the QuadSPI module
- Device delay corresponding to the input data

NOTE

The t_{total_delay} is specific to the characteristics of the actual implementation.

79.9.2 DQS sampling method

79.9.2.1 Basic description

In the DQS mode, the data strobe signal (DQS/RWDS) is used to sample the read data. Here, both DQS and the data sent by the flash memory move in the same direction; therefore, it is relatively easier to achieve at higher frequencies.

When using DQS for SDR reads, QuadSPI internally samples the incoming data on the rising edge of the strobe signal.

The next figure shows the sampling read data in the SDR mode using the DQS.

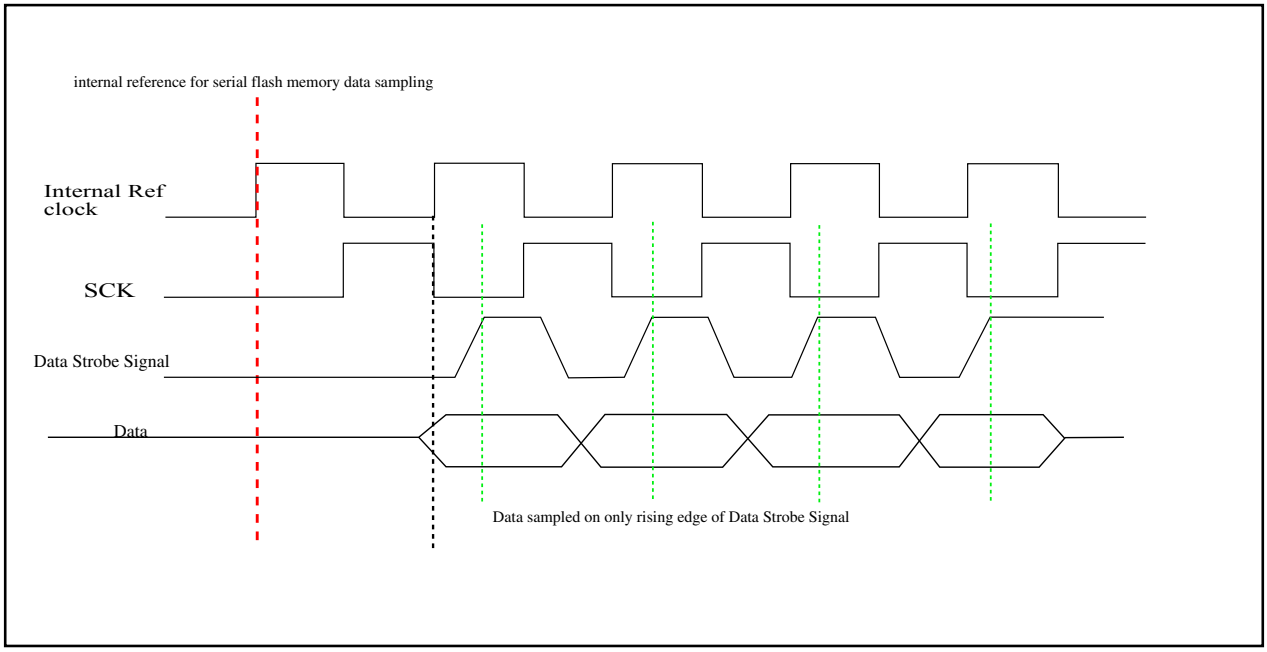

Figure 514. Data strobe functionality in SDR mode for read operation.

NOTE

Consider "Data Strobe Signal" as "Data Strobe Signal driven by memory" and "Data" as "Data from memory".

NOTE

Refer to the Datasheet for specific timing waveforms of QuadSPI

When using the DQS for DDR reads, QuadSPI internally samples the incoming data on both the edges of the strobe signal. See the next figure for details.

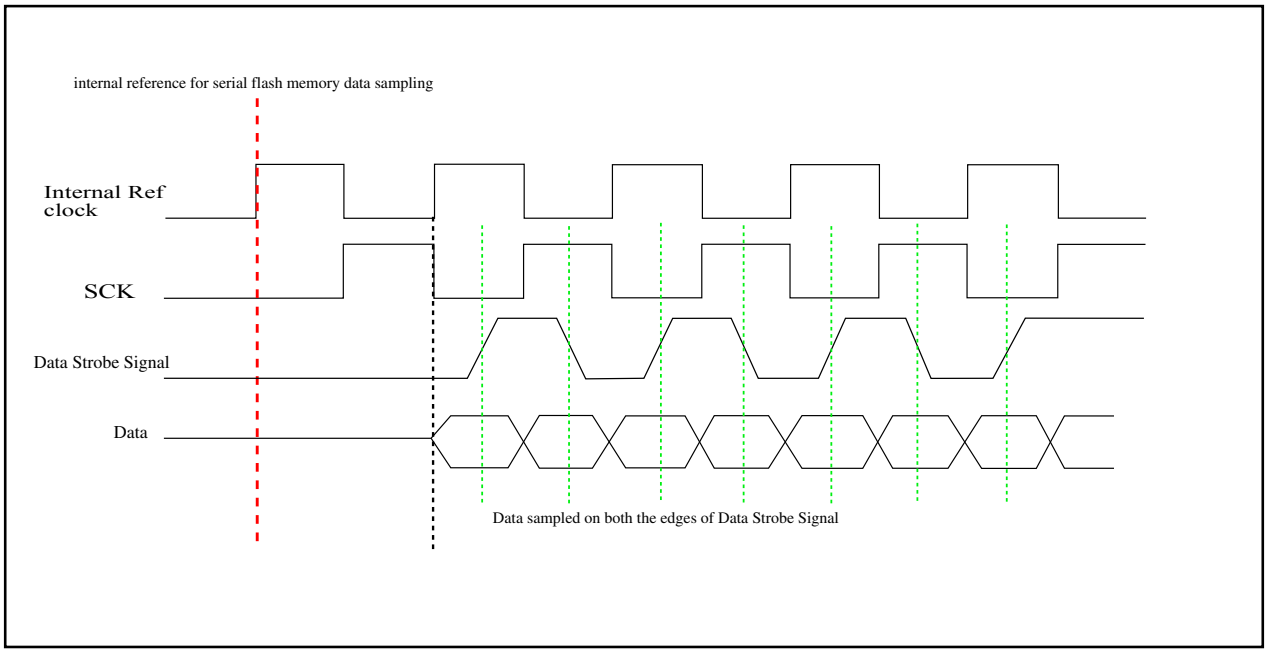

Figure 515. Data strobe functionality in DDR mode for read operation.

NOTE

Consider "Data Strobe Signal" as "Data Strobe Signal driven by memory" and "Data" as "Data from memory".

NOTE

For Specific details - Refer to the Data Sheet specification of QuadSPI module.

79.9.2.2 External DQS

In serial flash memories supporting DQS, the data strobe signal is an output from the flash memory device that indicates when data is being transferred from the flash memory to the host controller. The data is then captured by the controller on:

- Only one edge (either rising or falling edge) of DQS signal in the SDR mode
- Both rising/falling edges of the DQS signal in the DDR mode

This can be enabled by programming MCR[DQS_FA_SEL] = "11" for flash memory A. This mode supports the following configuration:

- Both high/low frequency delay chain manual programming using DLLCRA[SLV_DLY_COARSE] and DLLCRA[SLV_FLINE_OFFSET]
- DLL-assisted sampling only using and DLLCRB[DLLEN]
- DLL-assisted auto data learning using and DLLCRB[DLLEN] along with MCR{DLPEN]
- should be disabled as DLL is used

NOTE

This mode may not be available on the chip. See the "Supported read modes" section in the chip-specific QuadSPI information for the read modes that this chip supports.

79.9.2.3 Dummy Pad loopback

The internal clock is loop-backed from the dummy internal pad to compensate data pad delays. This can be enabled by configuring the value of MCR[DQS_FA_SEL] as "01" for flash memory A. This mode can be used with the following configuration:

- High/low frequency delay chain manual programming in bypass mode using DLLCRA[SLV_DLY_COARSE] and DLLCR[FREQEN].
- DLL-assisted sampling only using DLLCRA[DLLEN]

NOTE

Refer to DS or "Chip-specific section" of QSPI for Fixed sampling Tap specific settings/details with out without DLL (in bypass mode)

- DLL-assisted auto data learning using DLLCRA[DLLEN] and along with MCR[DLPEN]

NOTE

Refer to Auto-DataLearning (4x Sampling method) section with DLL for further details

NOTE

This mode may not be available on the chip. See the "Supported read modes" section in the chip-specific QuadSPI information for the read modes that this chip supports.

79.10 Data learning

79.10.1 Basic description

Data learning is used to manage varying data valid windows from the flash memory as well as any variations in the chip based on PVT conditions in the DDR mode. QuadSPI provides this feature via the DATA_LEARN instruction for all flash memories, irrespective of whether the flash memory supports it. The DATA_LEARN instruction accepts an operand that defines the number of bits of the known pattern for which the data learning has to be done. The known pattern is provided in the DLPR register.

QuadSPI supports the following data learning:

- QuadSPI supports data learning with DLL enabled only

The following sections explain data learning in detail.

79.10.2 DQS sampling method

The semi-automatic data learning is supported in the DQS sampling method. To start data learning:

1. Configure a known pattern in the Data Learn register inside flash memories that support data learning. The pattern should be selected to have multiple low and high transitions in the data bus.

   NOTE
   Certain flash memories provide data learning as a feature for DDR data reads.

2. Set up a QuadSPI DDR data read sequence, inserting a DATA_LEARN instruction before the READ_DDR instruction. The flash memory returns the data learning pattern in between dummy cycles in every read command. Each I/O gives the same DLP value for every clock edge.

   NOTE
   For flash memories that *do not* support data learning, configure a known location in flash memory with a known pattern. The pattern should not have 0h or FFh included. The pattern should be selected to have multiple low and high transitions in the data bus. Set up a QuadSPI DDR data read sequence, inserting a DATA_LEARN instruction. The address in the SFAR register should point to the known location within the pattern. Configure the known pattern in DLPR[DLPV]. See Programming the data learning pattern in flash memory for details on how the data has to be ordered in memory for correct operation.

3. Select a sampling point. See chip-specific QuadSPI information for selection of the sampling point.
4. Initiate the read via a peripheral transaction.
5. QuadSPI reads the data from the flash memory. It then encounters the DATA_LEARN instruction and samples the incoming data on both edges (rising and falling) of the DQS.

   NOTE
   If the data from the flash memory does not match the data learning pattern, the FR[DLPFF] flag is set. The QuadSPI module reports no sampling point automatically.

6. Repeat steps 2-7 with varying VT conditions for a particular process until FR[DLPFF] is set. The sampling points where no FR[DLPFF] is set signify a valid setting.

In the case of multiple valid settings, the software should select the middle point. The sampling point should be fixed within the above selected point for the next READ transactions.

NOTE
Ensure that QuadSPI is not accessed during calibration.

This feature might be used to auto-calibrate the sampling point for DDR reads, and auto-calibration might be triggered at fixed intervals, or depending on a change in PVT conditions.In case the sampling point needs to be changed based on initiating options (such as, DLL lock status, time period, or software forced interrupt), data learn instruction has to be re-initiated.

The following figure shows data learning in DQS mode.

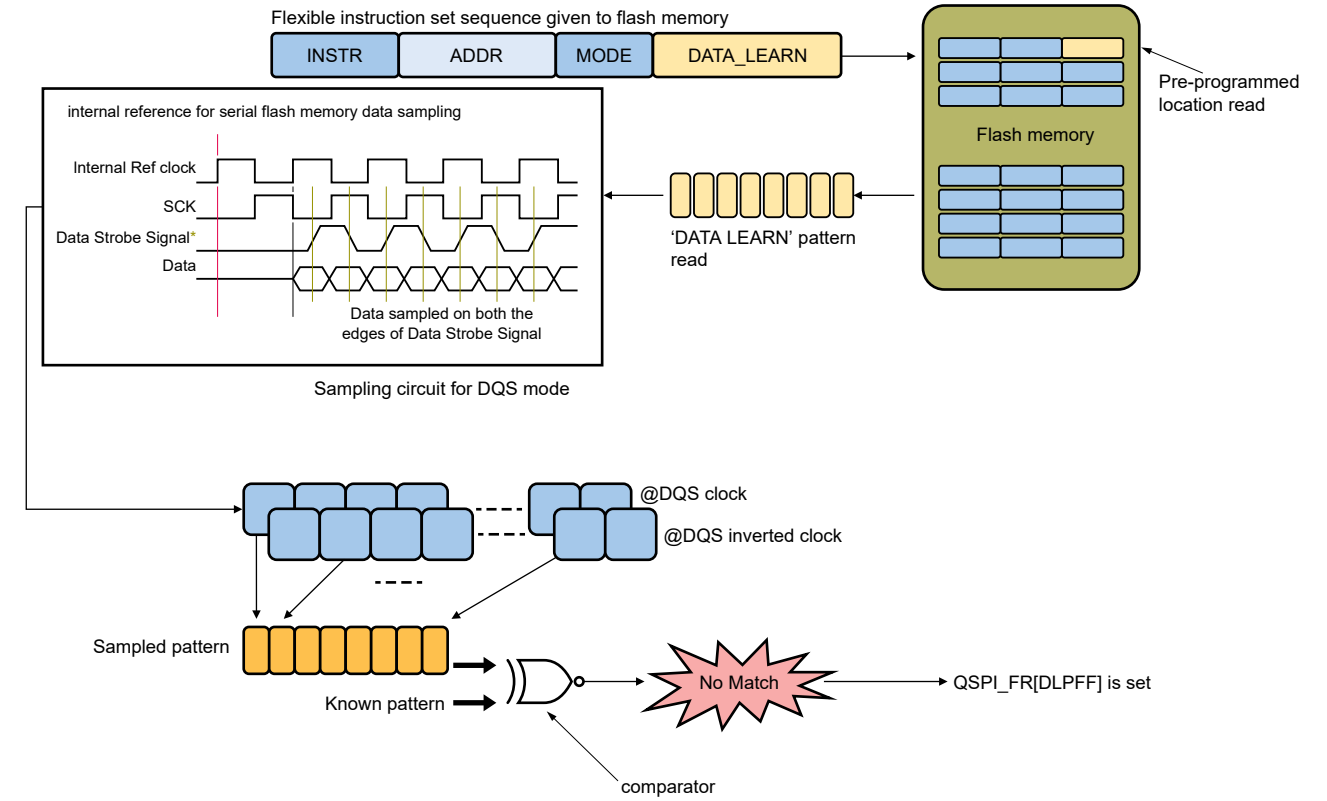

Figure 516. Data learning with DQS sampling method

NOTE

This mode might not be available on the chip. See the chip-specific QuadSPI information for the read modes that this chip supports.

79.10.3 Programming the data learning pattern in flash memory

Example scenario: If the value of DLPR[DLPV] is 43h, QuadSPI controller tries to match the sequence of bits sent on selected data lines with the pattern in DLPR[DLPV]. The following table shows the data programmed in flash memory with endianness taken into consideration.

Table 756. Programming the data learning pattern in flash memory

	Single Pad	Double Pad	Quad Pad	Octal Pad
DLPR IO1 pattern	0x349A	0x349A	0x3514	0x349A
DLPR IO3 pattern	NA	NA	0x349A	0x3514
Flash Pattern	0x2C59	0xF04CC226	0x0DF02D0D 0x00FFF020	0xF708f700 0xF70000FF 0x00FF0008 0x0000FFFF

79.11 DLL and delay chain usage

The DLL is a general-purpose, dynamically adaptive clock delay module. It provides the ability to select a quantized delay (in fractions of the clock period) regardless of on-chip variations such as process, voltage, and temperature (PVT). The DLL is suitable for applications where accurate delay adjustment is required, such as in case of DDR interfaces.

DLL working concept

The DLL control loop consists of a counter, reference delay line, and phase detector which operate on the ref_clock reference clock input. The reference clock (clk_ref) is fed into the reference delay line. After reset, a single delay tap is selected. A phase detector is used to detect the condition where a half shift has occurred. In addition to this, signals are generated to either increment or decrement the counter, which controls the delay line (if the half-phase detect condition is not met). Any changes in the delay of the individual elements of the delay chain (because of PVT) automatically cause the phase detector logic to determine if a change in the counter value is required. After the half-phase shift is detected, an internal lock signal is generated, and after a lock event occurs, the slave delay chain is ready to be updated based on a triggering event.

Slave delay chain programming sequence—

Following is the programming sequence for DLL bypass mode.

1. Program DLLCRA[SLV_EN]=1, DLLCRA[SLV_DLL_BYPASS]=1, and DLLCRA[SLAVE_AUTO_UPDT]=0.
2. Program the following fields to provide the desired DQS delay for sampling: DLLCRA[SLV_FINE_OFFSET], DLLCRA[SLV_DLY_COARSE], and DLLCR[FREQEN]. See the chip-specific QuadSPI information for the supported programming settings.
3. Program DLLCRA[SLV_UPD]=1 to load these values in the slave delay chain.
4. Check the slave delay chain update status by polling DLLSR[SLVA_LOCK]=1 and clear DLLCRA[SLV_UPD] after confirming the update state.

Following is the programming sequence for DLL auto update mode.

1. Program DLLCRA[SLV_EN]=1, DLLCRA[SLV_DLL_BYPASS]=0, and DLLCRA[SLAVE_AUTO_UPDT]=1.
2. Program the DLL configuration by using DLLCRA[DLL_REFCNTR] and DLLCRA[DLLRES]. See the chip-specific QuadSPI information for the supported DLL configuration settings.
3. Program the slave settings to delay DQS by using these fields: DLLCRA[SLV_FINE_OFFSET], DLLCRA[SLV_DLY_OFFSET], and DLLCR[FREQEN]. See the chip-specific QuadSPI information for the supported settings.
4. If offset delay needs to be updated on the slave chain, program DLLCRA[SLV_UPD]=1.
5. Enable DLL by programming DLLCRA[DLLEN]=1 and reset DLLCRA[SLV_UPD]=0. Slave delay chain is updated automatically and can be checked by polling DLLSR[SLVA_LOCK]==1

79.12 Secure flash protection

This secure flash module enforces access control policies based on the MGID, privilege and secure attributes of the IPS transactions. All accesses throughout the flash device need to be monitored to determine the validity of all accesses. If transaction from a given master has appropriate access rights, it is forwarded to flash, else the access is denied, and an error is generated.

There are two level of checks present in this module, based on MDAD and FRAD descriptors programmed. First level checks the input transactions based on secure attribute and MGID associated with that transaction which are checked according to MDAD. Second level check selects the appropriate FRAD based on address range of transaction. And each FRAD allows the transaction to pass through only when secure, privilege and other MGID related attributes are matching. Else the transaction is not forwarded and IPS bus error/interrupt is generated. Flash regions can be programmed to cover the entire address space to provide a default set of access permissions. For flash read transactions only first level of check is enabled.

Software can bypass both or anyone of these checks by writing to MGC[GVLDFRAD], MGC[GVLDMDAD] and MGC[GVLD] fields.

The IPS masters should write on QuadSPI register (SFAR, IPCR and TBDR) addresses for generating transfers to flash. SFP block monitors these IPS transfers and checks if the write is being done on SFAR or IPCR registers and forwards them for MDAD and FRAD checks. If the transaction passes both checks then it is passed through to QuadSPI register else bus error or interrupt is

generated. FRAD check is only done for flash write transactions not for read. Actual write on QuadSPI SFAR and IPCR register is done by SFP module only after the transaction passes MDAD and FRAD checks. There is only a single IPS slave interface which can be used for QuadSPI IPS register access and SFP IPS register access.

An IPS master transaction is secure if IPS_NONSECURE_ACCESS attribute is set to 0 for that transaction. An IPS master transaction is privileged if IPS_SUPERVISOR_ACCESS attribute is set to 1 for that transaction.

QuadSPI SFP related register sets are present here.

79.12.1 MDAD

These descriptors form the first level of checks on the input IPS transaction. There are two target group queues (TG0 and TG1) present in SFP block and each of these queues can be programmed with different set of MGAD descriptors checks in TG*n*MDAD registers. These registers are under access control and can only be programmed by privilege masters. These descriptors (one or both) should be programmed before start of any flash transaction else any IPS write on SFAR, IPCR or TBDR registers will generate an IPS bus error. After programming the target group descriptor the TG*n*MDAD[VLD] should be set to 1 for that register.

There are two target group queues (TG0 and TG1) so two transactions by different master ID can be stored inside SFP block while one of them is being processed by QuadSPI.

79.12.1.1 MDAD checks

- Secure check – This is decided by the TG*n*MDAD[SA] field of the MDAD descriptor. If the fields are set to 01 then queue is reserved for only non-secure transactions. If set to 10 then queue is reserved for only secure transactions. If the bits are set to 11 then this check is bypassed.
- MasterID check – This check compares themasterID of the input transaction with the MID match value set inTG*n*TG*n*MDAD[MIDMATCH]fields and allows only matching transactions inside the queue. There are 6 mask fields (TG*n*TG*n*MDAD[MASK]) inside the descriptor. If the mask type (TG*n*TG*n*MDAD[MASKTYPE]) is set to 0 then the input transactions master ID is ANDed with the mask bits before comparing with the MID match value. If the mask type is set to 1 then the input master ID is ORed with the masks bits and then compared with the MID match bits. Multiple master IDs can be allowed inside the queue using this mask.

When an IPS write is done to SFAR or IPCR registers then SFP block checks the attributes with MDAD descriptors of both the queues. If the attributes match with descriptor of any queue, then the value is written inside that queue and master ID is assigned to that queue. The queue is considered locked once the SEQID bits of IPCR register are written. So software should ensure that IPCR SEQID bits are written only after SFAR and other IPCR bits like DATSZ are written in that queue. The queue will be unlocked when flash transfer is completed for that transaction.

Once a master ID is assigned to a queue then transactions with only that master ID are allowed inside the queue. Any write of SFAR/IPCR is mapped to this queue even if other queue is free. So same master ID cannot have transaction on both queues at a time. The data in the queue is cleared once the flash transaction is finally completed by the QuadSPI.

The data path for input IPS writes to SFAR or IPCR registers are shown in the following figure.

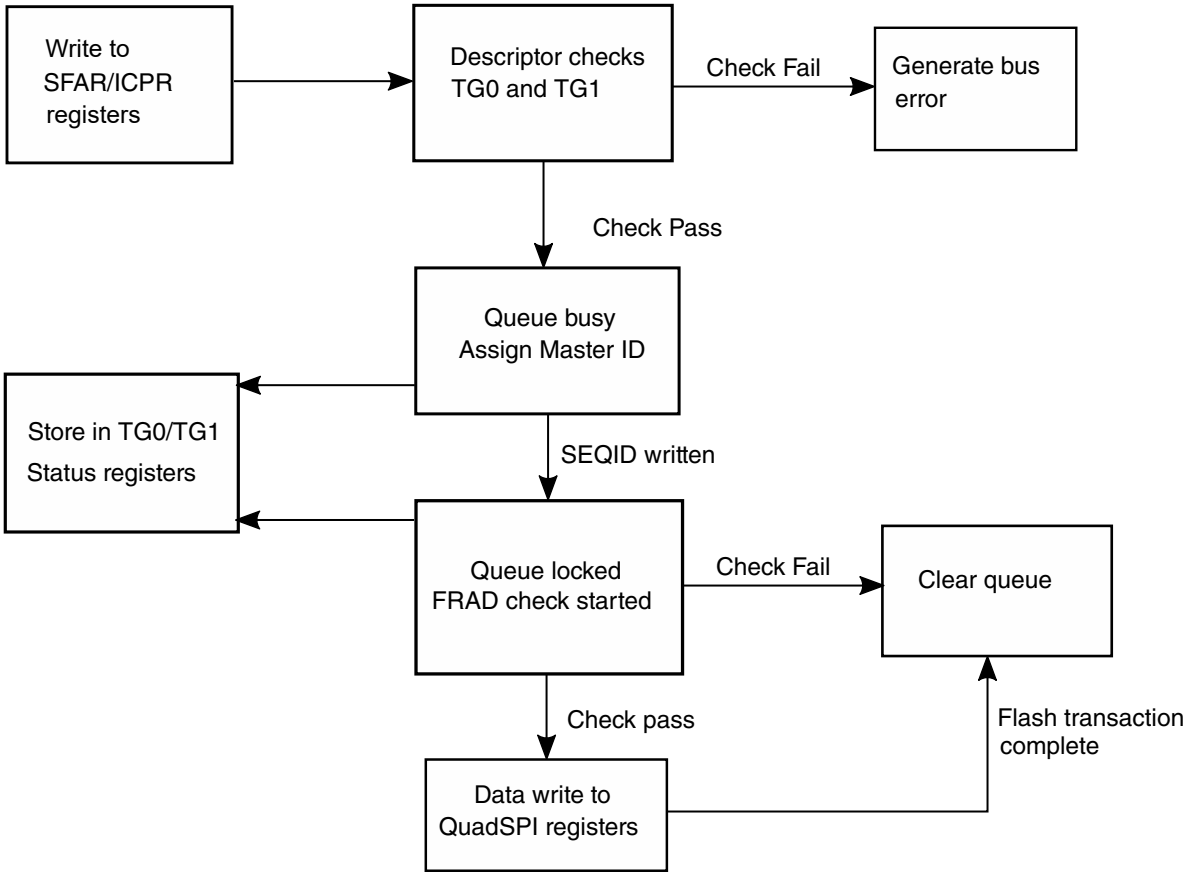

Figure 517. Data path for input IPS write to QuadSPI SFAR or IPCR registers

If the SFAR write passes first level of MDAD checks then the value is written in SFP register TG*n*SFAR and valid bit is set in TG*n*SFARS register and queue is considered as busy. Similarly when ICPR write passes the checks, its value is written into TG*n*IPRCS register and TG*n*IPRCS[VLD] field is set to 1 and queue is considered as locked. It is mandatory that IPCR is written only after SFAR has been written for a queue and queue is busy. If IPCR is written before SFAR then it will result in IPS transfer error. Master should ensure that it completes the programming sequence for flash access request (write SFAR and IPCR with SEQID) so that target queue is not left after writing SFAR or IPCR without the SEQID. Both queues TG0 and TG1 are processed in round robin arbitration. The queue receiving the data first is processed first and next queue is processed after the first transfer completes.

NOTE

TBDR register write is not allowed until the SFAR and IPCR entries of that master has passed MDAD and FRAD checks and the transaction is queued for writing to QuadSPI. If TBDR registers are written before arbitration win, transfer error will be generated. IPS master can read FSMSTAT register to check the status of their transaction. TBDR access is allowed when FSMSTAT[VLD] field is set and for the master whose master ID matches with fields [11:8] of this register, and field [1:0] are set to 01 or 10. IPCR and SFAR registers are forwarded to QuadSPI only after the TX buffer is filled till watermark level in case of write transactions. IPCR should be written only after SFAR has been written successfully to a queue.

79.12.1.2 Error conditions

The error conditions for first level of MDAD checks and the response is given in table below. These error conditions can occur when SFAR, IPCR or TBDR registers are being written.

NOTE

Queue is considered busy if it has been written successfully once with any of the values SFAR, IDATSZ or PAR.
Queue is considered locked when SEQID has been written successfully by passing MDAD checks.

Table 757. MDAD check error conditions

Error condition	Response	Common/Queue error
None of the queue descriptors are programmed	IPS transfer error is generated	Common error
Both queues are locked	IPS transfer error is generated	Common error
Both queues are busy and another master writes whose master ID is not matching with either queue.	IPS transfer error is generated.	Common error
Queue busy and same master writes SFAR or IPCR registers with wrong security attribute	IPS transfer error is generated and queue is cleared (SFAR and IPCR needs to be written again for transfer to start).	Queue error
Queue is locked and same master writes	IPS transfer error is generated	Common error
If master ID of transaction doesn't qualify MID check of any of the queues	IPS transfer error is generated	Common error
If both the queues are empty and security attribute of transaction doesn't match with any of the queues	IPS transfer error is generated	Common error
TBDR register is written before SFAR and IPCR SEQID qualifies MDAD checks	IPS transfer error is generated	-
If none of FRAD descriptors are programmed	IPS transfer error is generated	Common error
IPCR is written before SFAR	IPS transfer error is generated	Common Error - If the transaction doesn't matches the security attribute check or MID check of any MDAD. No common or queue error - If it matches security and MID attribute of any queue.

When a common error is generated its details are latched in IPSERROR register and corresponding error field is set to 1. This register will tell if the transaction failed because of queue locked, MID mismatch or security failure along with the master ID of that transaction. This register will keep the last error transaction latched unless cleared by writing 1 to CLR bit of this register. Then from next cycle onwards this register can latch new errors. Common error will also be generated if none of the FRAD descriptors are programmed. In case a queue is busy and same master writes IPCR or SFAR with wrong security attributes the queue is cleared, the Target Group n SFAR Status (TG0SFARS - TG1SFARS) valid bit goes low. In this case the master should write the SFAR an IPCR again for proper transaction to start.

In case of queue error the details are latched in Target Group n IPCR Status (TG0IPCRS - TG1IPCRS) or Target Group n SFAR Status (TG0SFARS - TG1SFARS) registers. These registers will also keep the error status latched until cleared by writing 1 to CLR bit of respective registers.

79.12.2 FRAD

These descriptors form the second level check for IPS flash write and flash erase transactions. IPS read transaction are not processed by this level of check and are passed through after MDAD checks. There are 8 FRADs which can be programmed by privilege masters. So the access checks can be programmed for up to 8 unique address ranges. Each of the address range

is equipped with different access attribute checks and based on this write access can be controlled for the flash region. These descriptors must be programmed before starting transactions on flash.

After programming the FRAD*n*_WORD0, FRAD*n*_WORD1, FRAD*n*_WORD2 and FRAD*n*_WORD3 registers, FRAD*n*_WORD3[VLD] field should be written 1. SFP block doesn't consider the FRAD descriptors which are not valid. If none of the FRAD are programmed, then error interrupt will be generated if enabled, and transaction is not forwarded to QuadSPI.

There is a descriptor lock feature to prevent spurious changes to the FRAD. FRAD*n*_WORD3[LOCK] can be programmed to make all FRAD registers as read only or to allow write access to all or some masters with specific master ID.

79.12.2.1 FRAD checks

- Address range checks – Start and end address for FRAD region are programmed in FRAD*n*_WORD0 and FRAD*n*_WORD1 registers. Start address of IPS flash transaction written in SFAR register and data size programmed in IPCR register, is used to check if the transaction lies within any of the FRAD address ranges. This address range match will be used to select the corresponding FRAD from which other access checks will be done. The start and end address are programmed around 64 KB boundary so 16 MSB are only used for range check..

  The data size should not be programmed as 0 in IPCR register for normal data transfers to flash and actual size should be programmed. In the cases where only flash instruction has to be send and no data has to be written in TBDR register, this DATSZ can be programmed as 0. In case the DATSZ is programmed as 0 in IPCR, SFP module blocks the write access to TBDR register and if any write is done then that generates IPS transfer error.

- Exclusive access lock – Exclusive master access lock can be enabled over any flash address defined under a FRAD. The master ID of the master which enables/owns the exclusive access is captured in FRAD*n*_WORD2[EALO] fields. Once enabled, the exclusive lock can be released only by the same master which enabled the lock by writing on FRAD*n*_WORD3[EAL] fields. The exclusive write access permissions of a flash region are decided as given in table below:

Table 758. Exclusive access lock

FRAD*n*_WORD3[EAL]	Write permissions
00	No lock. The write permissions are decided as set in FRAD*n*_WORD2[MDnACP] fields for respective master domain.
10	Write permissions are revoked for all masters. Any write transaction coming to this flash address region will not be forwarded through and will result in an error.
11	Write permissions are revoked for all masters except the master ID matching the ID specified by FRAD*n*_WORD2[EALO] fields.

- Flash region privilege checks – If the FRAD*n*_WORD3[EAL] fields are set to 00 then flash write access permissions for any IPS master is decided based on the settings done in FRAD*n*_WORD2[MDnACP] fields as given in table below. MD0ACP permission checks are done for transaction coming through target group 0 queue (TG0) and MD1ACP permission checks are for transactions coming through target group 1 queue (TG1).

Table 759. Flash region privilege checks

MDxACP value	Privilege access	Secure access	Write access
111	No	No	Not allowed
	No	Yes	Not allowed
	Yes	No	Allowed
	Yes	Yes	Allowed
110	No	No	Allowed
	No	Yes	Allowed

Table continues on the next page...

Table 759. Flash region privilege checks (continued)

MDxACP value	Privilege access	Secure access	Write access
	Yes	No	Allowed
	Yes	Yes	Allowed
101	No	No	Not allowed
	No	Yes	Not allowed
	Yes	No	Not allowed
	Yes	Yes	Allowed
100	No	No	Not allowed
	No	Yes	Allowed
	Yes	No	Not allowed
	Yes	Yes	Allowed
0xx	-	-	Not allowed

If any transaction fails FRAD check then error interrupt is generated if enabled.

FRAD status registers keep the details of last transaction which lie within the address range of that respective FRAD and will be updated only when a new transaction comes which falls within the same address range.

Flash Region Compare Address Status (FRAD0_WORD4 - FRAD7_WORD4) register stores the flash start address that was compared and Flash Region Compare Status Data (FRAD0_WORD5 - FRAD7_WORD5) contains the master ID, privilege and secure attributes of the transaction. The transaction details are stored in FRAD register for which the address compare check passed. These status registers are not updated in case of read transfers or when FRAD check is disabled. For example, if the transaction address lies in the range set in FRAD2_WORD0 and FRAD2_WORD1 then the transaction details will be stored in FRAD2_WORD4 and FRAD2_WORD5 registers and valid field [30] will be set. If transaction fails, the security or privilege attribute check for the corresponding FRAD then error field [29] is set in FRADx_WORD5 status register. This bit and other transaction details will remain latched unless cleared by writing '1' to W1C bit of corresponding FRAD in ERRSTAT register.

If transaction address doesn't match any of the FRAD address range or if matches with multiple FRAD address ranges, then also error interrupt is generated. But for no FRAD match, the details will not be stored in any of the FRAD status registers.

FRAD checks are done only for flash write transactions, flash read transactions are passed through to QuadSPI if MDAD checks are passed. At least one FRAD region should be made valid (if the FRAD check is enabled from MGC register) for flash read instructions to go through even when FRAD check is not done for read instructions. SFP module checks if a transaction is read or write from the SEQID written in IPCR register and LUT table programmed inside QuadSPI. Master Read Command (MRC) register shows the read command code which SFP block identifies. There are two command codes which are predefined READ_DDR and READ commands. Software can program two other command code as per its convenience by writing into fields [21:16] or [29:24] and then writing respective valid bit as 1.

79.12.2.2 Error conditions

Any transaction passing the MDAD checks will be checked for FRAD checks and can lead to following error scenarios.

Table 760. Error conditions

Error condition	Response
None of the FRAD are programmed	IPS transfer error will be generated and status will be latched in IPS_ERROR register

Table continues on the next page...

Table 760. Error conditions (continued)

Error condition	Response
Transaction address doesn't fall within any of the FRAD address range	Error interrupt will be generated if enabled
Transaction match with multiple FRAD address range	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Transaction passes FRAD address check but fails privilege or security checks	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Transaction passes FRAD address check but range was locked by EAL bits	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Read transaction	No FRAD check will be done and no error will be generated for FRAD failure. But if FRAD check is enabled in MGC then at least one FRAD should be valid else it will give error during SFAR/IPCR write

79.12.2.3 Atomic commands considerations

For security reasons, the atomic commands (where flash's internal configuration region is accessed) like flash erase etc. should always be programmed in last 6 SEQID locations of LUT. FRAD0 has access to all the LUT locations including these last 6 SEQID. Remaining FRAD regions will not allow write access if the IPCR SEQID is set for any of the last 6 locations of LUT. It will result in FRAD access error and it will set in FRAD status registers. Also the software must set the FRAD0 MDACP to 101 so that write access is allowed only for secure privilege masters. This is done to ensure that no other master can use the atomic commands like flash erase to change the contents of flash. So when any master wants to use these atomic command programmed in last 6 locations of LUT it will have to write FRAD0 start address in SFAR and keep IPCR DATSZ such that it falls under FRAD0 address region and MDACP programmed in FRAD0 are checked.

For flash configuration in case of dual-die the software needs to change the address range of FRAD0 accordingly so that address goes to second die. Similar consideration to be taken in case of dual flash where Port A and B are being used.

79.12.3 TBDR register write lock

SFP module keeps the TBDR write locked for IPS transactions by default. When a IPS master writes SFAR and IPCR transactions and this transaction passes MDAD and FRAD checks then the accesses are unlocked for that master ID. Lock and unlock procedure is shown with an example in figure below:

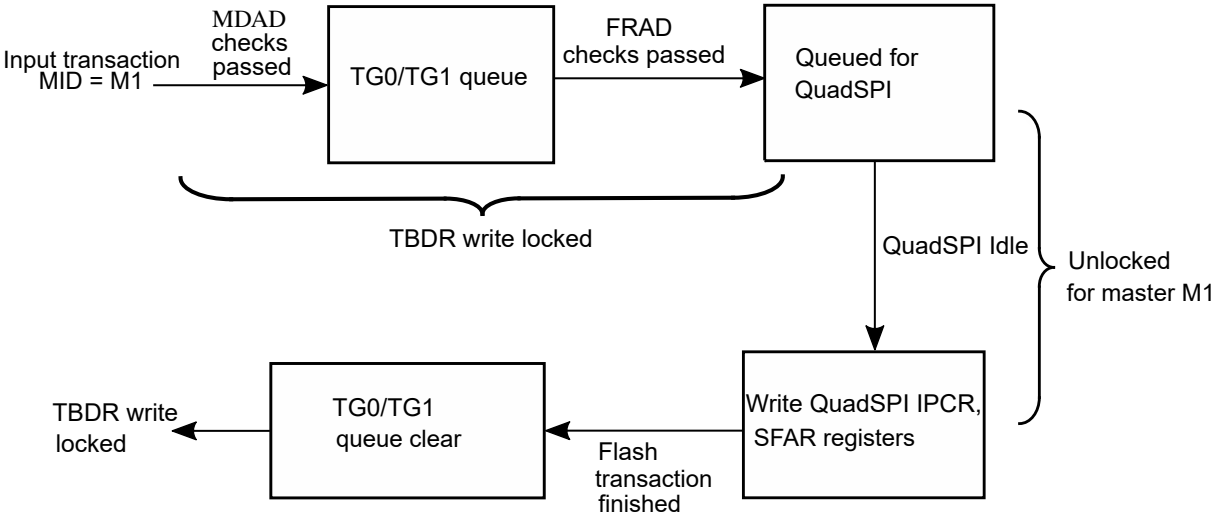

Figure 518. TBDR lock and unlock procedure

If any master writes on TBDR register when it is not unlocked for that master ID it will result in IPS transfer error. IPS master should ensure that it writes the TBDR register once QuadSPI registers have been written by the SFP module. This can be checked by reading FSM Status (FSMSTAT). Bits [11:8] of this register tells which master ID is currently active, and if the value of bits [1:0] is 01 or 10 and bit 31 is set as 1, then the TBDR lock is open for write transactions. It is advisable that for write transactions where IDATSZ is non zero, master clears the TBDR buffer from any residue data and program the TBCT[WMRK] watermark once its request is granted in arbitration (FSMSTAT bit [1:0] are 01). In case of transfers having IDATSZ programmed as 0 the TBDR register remains locked and data can't be written to this register. In case DMA is being used to fill the TBDR buffer, program RSER[TBFDE] field to 1 only when write access is granted and TBDR access is unlocked after checking FSMSTAT[STATE] field. Once DMA completes the TBDR write reset, this field is set back to 0. After this, the SFP will write SFAR and IPCR to QuadSPI triggering the flash transfer. It should be made sure that the DMA should have same master ID as the master which won the arbitration.

79.12.4 Transaction status registers

SFP module has two registers (FSM Status (FSMSTAT) and FlashSeq Request (FLSEQREQ)) which shows the current and last transaction status. These registers are updated only after MDAD and FRAD check are passed.

- FSM Status (FSMSTAT) register shows the current transaction which is queued for QuadSPI when valid field [31] is set. Field [16] of this register if set to 1 then it is a non-read instruction sequence and it is set to 0 then it means that this is a read sequence. Fields [11:8] show the master ID from which this transaction is generated. Fields [1:0] show the current state of active transaction when valid field [31] is set.

  The figure below shows the IPS transaction flow inside SFP block along with various values of bits [1:0]:

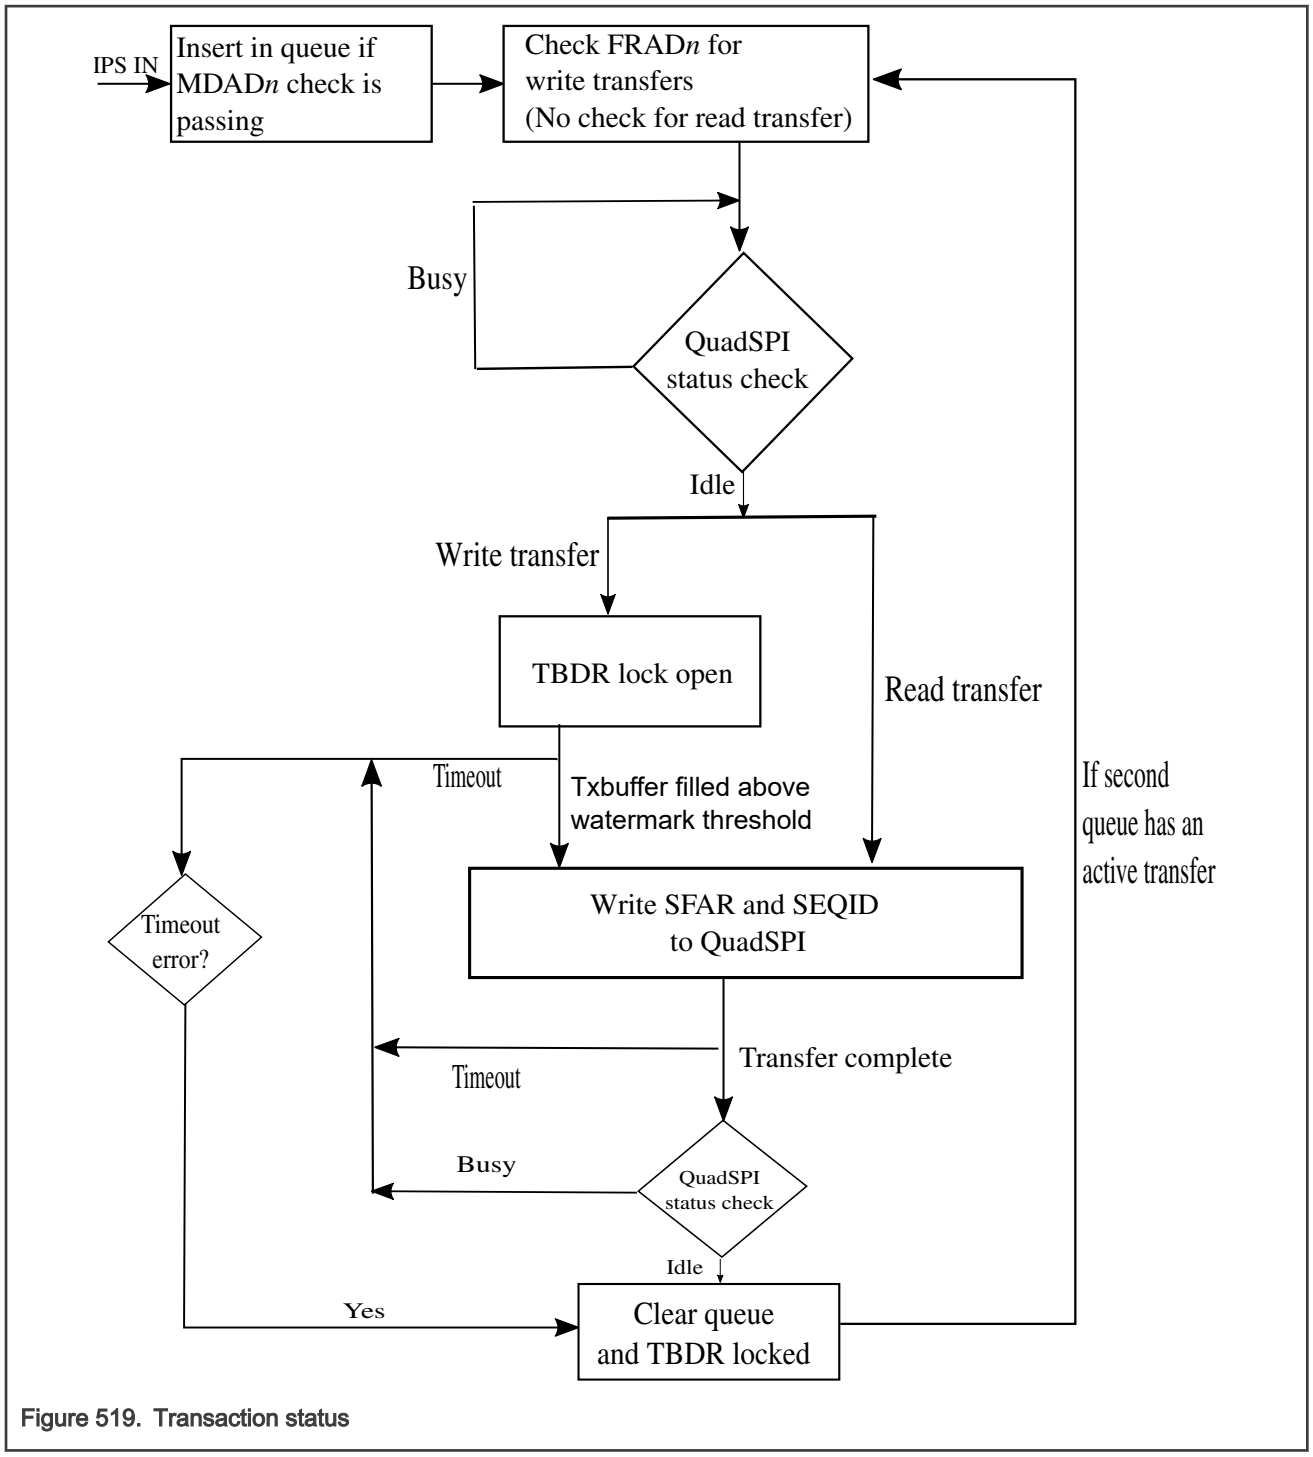

Figure 519. Transaction status

NOTE

If the DATSZ programmed in TG0/TG1 IPCR register is more than the TX buffer watermark threshold value (256-Watermark programmed in TBCT) then it waits for threshold to cross before writing the SFAR and IPCR registers to QuadSPI. Else SFP block waits for one entry to be written to TBDR register and after that it writes the SFAR and IPCR to QuadSPI thus triggering the transfer. In case of read transfers, SFAR and IPCR are written as soon as QSPI is IDLE.

NOTE

QuadSPI is considered IDLE if transaction is finished at flash, No DMA and interrupt pending and RX data is completely read. In case RX data is pending it can be cleared by writing to MCR[CLR_RXF]. Refer to section Timeout error for more details.

FSM state values in FSM Status (FSMSTAT) for different states are in the following table:

Table 761. FSMSTAT register field details

FSMSTAT register fields	
VLD	0 - No IPS transfer is queued for launch to QuadSPI 1 - IPS transfer is queued or running in QuadSPI
STAT	00 - QuadSPI is busy with AHB transfer, any DMA transfer is pending, RDBFL has residue data or any interrupt is pending. 01 - TBDR lock is open. QuadSPI considers IPS transfer. AHB transfer should not start. 10 - TX buffer filled above threshold. Write transfer is triggered. SEQID is written. 11 - Read transfer is triggered. SEQID is written.

For flash write transfers which passes MDAD and FRAD checks and QuadSPI is not busy with any previous transfer, TBDR lock is opened and bits [1:0] shows value of 01. Once the IPS master fills the TX buffer till the level where free entries in TX buffer are less than the watermark threshold set in TX Buffer Control Register (TBCT) and SR[TXWA] flag is de-asserted, SFP block writes the SFAR and IPCR entries to QuadSPI registers and transaction is triggered. To avoid underrun, program the watermark accordingly for size of the data to be transferred. This programming can be done when TBDR access is allowed after arbitration is granted. TBCT Watermark can be programmed as 256-(IDATSZ/4-1) in most of the scenarios. If the DATSZ entry written in IPCR is less such that TX buffer can never be filled till watermark threshold, in such cases SFP block does not wait for the TBCT[WMRK] to trigger and writes the SFAR and ICPR registers as soon as one data entry is written to TBDR register. When the SFAR and IPCR register are written, bits [1:0] are set to 10. In case of flash memory read transfers SFAR and IPCR entries are written to QuadSPI as soon as QuadSPI is IDLE and bits [1:0] are set to 11. QuadSPI is considered IDLE only if no AHB/IPS transfer is ongoing, any DMA transfer is not pending, RDBFL doesn't have residue data and any interrupt is not pending (FR[TFF], FR[TBFF], FR[TBUF], FR[RBDF], FR[RBOF], FR[ABOF], FR[AIBSEF], FR[AITEF], , , FR[IPIEF], , FR[ILLINE], ,). Valid bit [31] goes to 0 once the IPS transfer is completed. IPS master should clear the TX buffer before writing to TBDR register to ensure that no data from previous transaction is left in TX buffer.

If the IPS transaction has passed the MDAD and FRAD checks but QuadSPI is busy with some AHB transfer, then the bits [1:0] are set to 00. Other than ongoing AHB transfer QuadSPI can be busy because of other reasons also like if any TXDMA or RXDMA pending, if read buffer has data pending or if any QuadSPI interrupt is enabled and pending for servicing. So IPS master should ensure that no interrupt is pending or previous read transfer is completed. If the QuadSPI remains busy for a longer time it may result in timeout error.

Software must take care that no AHB transaction is launched when any IPS transaction is ongoing, TBDR lock is open or IPS transaction is getting executed on QuadSPI. It can be checked by reading this FSM status register. if the valid bit is 1 and bits [1:0] are set to 01, 10 or 11 then no AHB transfer should be generated towards QuadSPI.

For any IPS initiated RW transaction which needs two separate transactions at flash interface, like Write-Enable transaction followed by Write-data transaction (Data-Learn flash transaction followed by Read-data transaction) at flash interface must be joined together with JMP_2_SEQ instruction.

- FlashSeq Request (FLSEQREQ) register holds the details of transaction which was last send to QuadSPI. After a flash transaction is completed this register is updated and its valid field [31] is set to 1. This register holds the command type (read or write), transaction master ID (fields [3:0]), target group queue (TG0 or TG1) from which this transaction passed in field [4], privilege and secure attributes for the transaction, SEQID (fields [19:16]) and number of flash descriptor FRAD within whose address range the transaction lies (fields [14:12]).

This register also contains a timeout error field [27] which is set when a timeout error occurs, and transaction is aborted. When the error occurs this register keeps the status latched unless it is cleared by writing 1 to clear field [29].

79.12.5 Timeout error

MTO register can be programmed with a timeout value above which the transaction should be aborted. When the transaction passes MDAD and FRAD level checks and QuadSPI is idle (no AHB transaction is ongoing, no DMA transfer is pending, RDBFL doesn't have any residue data from last transfer and (FR[TFF], FR[TBFF], FR[TBUF], FR[RBDF], FR[RBOF], FR[ABOF], FR[AIBSEF], FR[AITEF], , , FR[IPIEF], , FR[ILLINE], ,) interrupt is not pending) this counter is started. If the transaction is not completed before this timeout counter reaches the value programmed in MTO register the transaction is considered aborted by SFP and an error interrupt is generated if enabled. The error bit is also set in FLSEQREQ register along with the transaction details. After the timeout error, next transaction is written to QuadSPI register which was queued in another target group queue once SR[BUSY] flag goes low.

79.12.6 Arbitration lock

The arbitration lock feature is used to lock the arbitration for a particular queue. This lock can be requested by a master by writing '1' into IPCR[ARB_LOCK] field. Once the transaction passes both the checks (MDAD & FRAD) and wins the arbitration, this lock will be granted. After this, the transaction from the other queue will not be granted unless the arbitration is unlocked by previous queue. The master which locked the arbitration can unlock it by writing '1' to IPCR[ARB_UNLOCK] field. Once the transaction with unlock bit 1 passes the MDAD and FRAD checks, it will unlock the arbitration. After this transaction is finished, the other queue will be granted the arbitration which was waiting.

This arbitration lock feature can be used by software while doing any transaction to flash which may result in a waiting period. For example, in case of NOR flash, after a write is issued to flash there is a waiting period (TPP) for which the flash is inaccessible. In this case, the software should ensure that while writing this SEQID to IPCR register it should lock the arbitration so that transaction coming to other queue is not passed to flash controller which may result in failure. Once the software ensures that waiting period at flash is over, it can read the flash configuration/status registers to confirm. And after getting confirmation, it can send another read command to same configuration register with IPCR[ARB_UNLOCK] field set to '1'. This will ensure that the transaction waiting in another queue are granted. If the flash being used does not have a waiting period attached with transactions, then this ARB_LOCK field can be always kept to 0.

In case software uses this LOCK functionality RWW support will not be available. Because in this case, all the transaction from other queue which was blocked from arbitration will be blocked irrespective of read or write access. So, RWW support (read can go through even when flash is in waiting state) will not be available. The master which has arbitration lock granted can still send read accesses to flash during the waiting period in case the flash supports it.

79.12.7 Soft reset consideration with SFP

If there is any pending transaction in MDAD queue, do not assert QuadSPI reset bits unless you observe unexpected behavior like no response from the module. In that case, assert QSPI reset twice.

In case the soft reset is being used for QSPI, software should take some considerations so that correct functionality is maintained. if the soft reset is asserted when a transaction is being executed by SFP (FSM_STATE [1:0] bits are 01, 10 or 11) then this transaction will be aborted. Different conditions that can occur in case of soft reset are listed in table below:

Table 762. Soft reset conditions

Condition at time of soft reset	FSM state register at time of soft reset	Result	Timeout scenario
Some AHB transaction was ongoing and SFP/IPS is in waiting state.	FSM_STATE[1:0] = 00	After the soft reset if de-asserted the SFP will schedule its transaction over QSPI. FSM_STATE[1:0] will change to other values than 00. Software can fill TBDR in case it is a write transfer or start reading from RBDR.	In this case software doesn’t writes to TBDR or read from RBDR it will result in timeout error.

Table continues on the next page...

Table 762. Soft reset conditions (continued)

Condition at time of soft reset	FSM state register at time of soft reset	Result	Timeout scenario
QSPI was IDLE and SFP transaction has been arbitrated. TBDR is being filled and SFAR, IPCR are not currently written to QSPI.	FSM_STATE[1:0] = 01	Currently TBDR was being filled after soft reset all the entries in TBDR are flushed. So it is expected from software that it will start filling TBDR from start after the reset has de-asserted. SFP will write SFAR and IPCR to QSPI once its normal conditions are met (when number of available spaces in the TX buffer is greater than or equal to the value provided by TBCT[WMRK] or single TBDR write in case watermark check is disabled)	Timeout will occur if TBDR is not filled again after the soft reset is lifted.
SFP has written just SFAR to QSPI IPCR is not written yet. (For a read transfer or write transfer with data size 0)	FSM_STATE[1:0] = 01	After the soft reset is lifted the SFP will write ICPR to QSPI module and FSM_STATE will change to 11 (read) or 10(write). Transaction will finish normally.	Timeout conditions will be same as that for normal transfer.
SFP has written just SFAR to QSPI IPCR is not written yet. (Write data size is non 0)	FSM_STATE[1:0] = 01	After soft reset is lifted the SFP will write IPCR to QSPI module once software fill TBDR (from start) and FSM_STATE will change to 10.	Timeout conditions will be same as that for normal transfer.
SFP has written SFAR and IPCR to QSPI.	FSM_STATE[1:0] = 10 or 11	After the soft reset is de-asserted the current transaction will be deemed aborted. FSM_STATE valid will go low as transfer has finished.	No timeout.

So to conclude in case the soft reset is asserted when FSM_STATE[31] bit is 1 and state bits are 10 or 11 current transaction will be aborted & the next transaction will proceed as normal. In case the state bits are 00 or 11 then it is advisable that software doesn't writes into TBDR after the reset is de-asserted and waits for timeout error to be generated to know when current ongoing SFP transaction is aborted. After clearing the timeout error a new transaction can be launched to SFP or if already a new transaction is present in another queue it will be arbitrated.

79.12.8 Error Interrupt Enable

INT_EN register allow software to disable or enable the interrupt signal generation in case of any of the listed error conditions. This interrupt is generated on 'ipi_int_ored' interface signal of QuadSPI.

- Time out error (INT_EN[TO_ERR])
- IPCR register write error (INT_EN[TG*n*IPCR])
- SFAR register write error (INT_EN[TG*n*SFAR])
- IPS common error (INT_EN[IPS_ERR])
- FRAD access error (INT_EN[FRAD*n*ACC])
- No FRAD address range match error (INT_EN[FRADMTCH])

If the respective field is set to 1 for any of the error conditions, then the interrupt signal is set to 1 when that error occurs and it remains set until the error is cleared by writing 1 to error clear bit as listed in register descriptions.

79.13 Memory map and register definition

This section provides the memory map and register definitions for the QuadSPI module.

79.13.1 Register write access

Following are the write access restriction terms that apply to all the registers:

- Register write access restriction

  For each register field, the write access conditions are specified in the detailed register description.

  The following table provides a description of the write access conditions. If, for a specific register bit or field, none of the given write access conditions is fulfilled, any write attempt to this register bit or field is ignored without any notification. The values of the bits or fields are not changed.

  The condition term [A or B] indicates that the register or field can be written to if at least one of the conditions is fulfilled.

Table 763. Register write access restrictions

Condition	Description
Anytime	No write access restriction
Disabled mode	Write access only if MCR[MDIS] = 1
Normal mode	Write access only if the module is in the normal mode

- Register write access requirements

  You can access all registers using 8-bit, 16-bit, and 32-bit wide operations. For some of the registers, at least a 16-bit or 32-bit wide write access is required to ensure correct operation. This write access requirement is stated in the detailed register description for each affected register.

79.13.2 QuadSPI register descriptions

This section provides the memory map and register definitions for the QuadSPI module.

Access to the following addresses does not result in a transfer error:

- 64h
- 138h
- 168h
- 188h
- 18Ch
- 198h

79.13.2.2 Module Configuration Register (MCR)

Offset

Register	Offset
MCR	0h

Function

This register holds configuration data associated with the QuadSPI operation.

NOTE

When out of reset, after first initial MCR programming and exiting module disable mode (that is, when the value of MCR[MDIS] is 0), you must write 1 to MCR[SWRSTSD] and release it after six (three system and three flash memory) clock cycles.

Special write-access is permitted in different modes:

- DQS_FA_SEL: Disabled mode
- ISD3FA, ISD2FA: Disabled mode
- All other fields: Anytime

23 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
22 —	Reserved
21-20 —	Reserved
19 —	Reserved
18 —	Reserved
17 ISD3FA	Idle signal drive IOFA[3] flash memory A Determines the logic level that the IOFA[3] output of the QuadSPI module is driven to in the inactive state. See Driving flash memory control signals in single and dual modes for details. 0b - IOFA[3] is driven to logic L 1b - IOFA[3] is driven to logic H
16 ISD2FA	Idle signal drive IOFA[2] flash memory A Determines the logic level that the IOFA[2] output of the QuadSPI module is driven to in the inactive state. See Driving flash memory control signals in single and dual modes for details. 0b - IOFA[2] is driven to logic L. 1b - IOFA[2] is driven to logic H.
15 —	Reserved
14 MDIS	Module disable Allows the clock to the non-memory mapped logic in the QuadSPI to be stopped. 0b - Enable QuadSPI clocks 1b - Allow external logic to disable QuadSPI clocks
13 —	Reserved
12 DLPEN	Data learning pattern enable Write 1 to this field to enable data learning mechanism.
11 CLR_TXF	Clear TX FIFO/buffer This is a self-clearing field that invalidates the TX buffer content.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE Software must wait for at least five system cycles and three flash cycles after writing '1' to this field. 0b - No action 1b - Read and write pointers of the TX buffer are reset to 0 and TBSR[TRCTR] is reset to 0.
10 CLR_RXF	Clear RX FIFO This is a self-clearing field that invalidates the RX buffer content. 0b - No action 1b - Read and write pointers of the RX buffer are reset to 0 and RBSR[RDBFL] is reset to 0.
9 —	Reserved
8 VAR_LAT_EN	Variable latency Is used to enable the variable latency feature in the controller. This field is valid for HyperRAM where data strobe acts as an output from the memory during the command and address (CA) cycles of a read or write transaction. This is to indicate whether additional initial access latency is needed to perform a dynamic memory refresh operation. For details, see HyperRAM support. 0b - Fixed latency: Twice + 1 latency enable 1b - Variable latency: "Once" or "twice + 1" the initial latency based on data strobe during the CA phase. If enabled, you need to ensure that the value of FLSHCR[TCSS] is >= 2.
7 DDR_EN	DDR mode enable Enables the DDR mode 0b - 2x clock disabled for SDR instructions only 1b - 2x clock enabled for DDR instructions. Note: 2x clock - This is twice the SCKF clock used to shift the TX data by 90 degree.
6 DQS_EN	DQS enable Is valid for both the SDR and DDR modes. For details, see DQS sampling method. 0b - Reserved. Do not program 0 to this field. 1b - DQS enabled. The incoming data is sampled on both the edges of the DQS input when the value of MCR[DDR_EN] is 1; else, on only one edge when MCR[DDR_EN] is 0.
5 —	Reserved
4 DQS_OUT_EN	DQS as an output

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Is valid when data strobe is also used as an output from controller during the write data phase. This is valid for HyperRAM where the data strobe acts as a Read Write Data Strobe (RWDS). For details, see HyperRAM support. 0b - DQS as an output from controller is disabled. 1b - DQS as an output from controller is enabled.
3-2 —	Reserved
1 SWRSTHD	Software reset for AHB domain 0b - De-assert Software reset 1b - AHB domain flops are reset. This field does not reset configuration registers. It is advisable to reset both the serial flash memory domain and AHB domain at the same time. Resetting only one domain might lead to side effects. **NOTE** The software resets need the clock to be running to propagate to the design. The value of MCR[MDIS] should be 0 when the software reset bits are asserted. Also, before they can be deasserted again (by setting MCR[SWRSTHD] to 0), it is recommended to set the value of MCR[MDIS] to 1. After the software resets have been deasserted, the normal operation can be started by setting MCR[MDIS] to 0. **NOTE** Software must wait for at least three system cycles and three flash cycles after changing the value of this field.
0 SWRSTSD	Software reset for serial flash memory domain 0b - De-assert Software reset 1b - Serial flash memory domain flops are reset. This field does not reset configuration registers. It is advisable to reset both the serial flash memory domain and AHB domain at the same time. Resetting only one domain might lead to side effects. **NOTE** The software resets need the clock to be running to propagate to the design. The value of MCR[MDIS] should therefore be 0 when the software reset bits are asserted. Also, before they can be deasserted again (by specifying 0 as the value for MCR[SWRSTSD]), it is recommended to specify 1 as the value for MCR[MDIS]. After the software resets are deasserted, the normal operation can be started by specifying 0 as the value for MCR[MDIS]. **NOTE** Software must wait for at least three system cycles and three flash cycles after changing the value of this field.

79.13.2.3 IP Configuration Register (IPCR)

Offset

Register	Offset
IPCR	8h

Function

This register provides all the configuration required for an IP-initiated command, which can be triggered by writing in the SEQID field of this register. If the SEQID field is written successfully, a new command to the external serial flash memory is initiated per the sequence pointed to by this field. See Normal mode for details on command triggering and command execution.

Special write-access is permitted if:

- SR[IP_ACC]=0

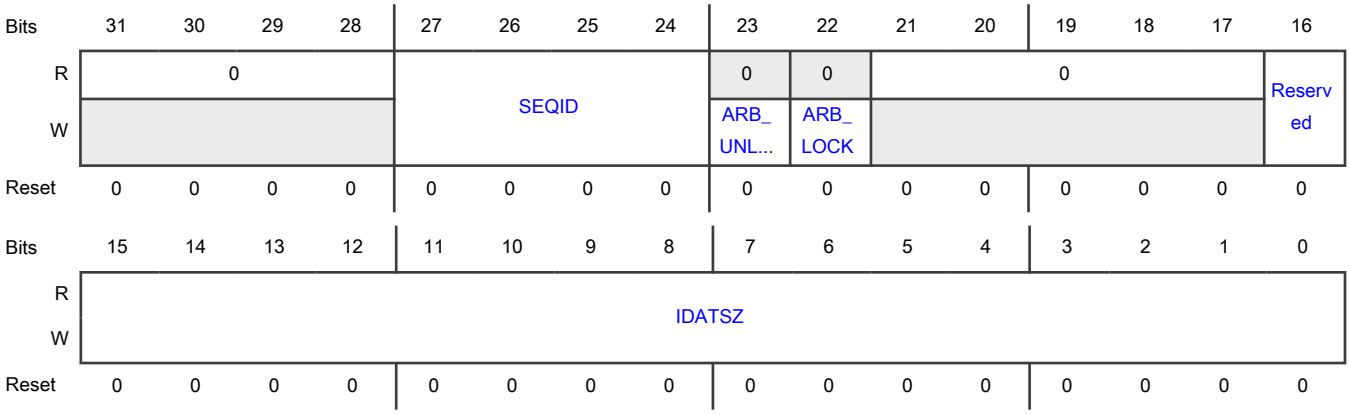
NOTE

Only one of the fields should be written '1' at a time out of ARB_LOCK and ARB_UNLOCK. If both the fields are written '1' at same time then it will invert the lock status. If the arbitration was already locked, it will unlock it and vice-versa.

NOTE

If MDAD and FRAD checks are enabled in MGC register but none of the MDAD and FRAD descriptors are valid, then any write on this register will generate a bus transfer error

Diagram



Fields

Field	Function
31-28 —	Reserved
27-24 SEQID	Points to a sequence in the LUT This field contains the sequence index of the LUT. See LUT for details.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Each sequence index can accommodate up to 10 instructions (2 instructions per register). In case of read command, a write to this field triggers a transaction on the serial flash memory interface if QSPI SFM is IDLE. In case of write command, a write to this fields unlocks the TBDR access if QSPI SFM is not busy. Refer to section Secure flash protection for more details
23 ARB_UNLOCK	Arbitration Unlock Writing 1 to this bit unlocks the arbitration. Writing 0 will have no effect. The arbitration unlock will be done only if the transaction passes both MDAD and FRAD checks. To lock the arbitration write 1 to ARB_LOCK bit. This bit is always read as 0.
22 ARB_LOCK	Arbitration Lock Writing 1 to this bit locks the arbitration for that specific target queue. Writing 0 will have no effect. The arbitration lock will be granted only if the transaction passes both MDAD and FRAD checks. To unlock the arbitration write 1 to ARB_UNLOCK bit. This bit is always read as 0.
21-17 —	Reserved
16 —	Reserved
15-0 IDATSZ	IP data transfer size This field defines the data transfer size, in bytes, of the IP command.

79.13.2.4 Flash Memory Configuration Register (FLSHCR)

Offset

Register	Offset
FLSHCR	Ch

Function

This register contains the timings that are specific to the flash memory device. The QuadSPI controller must meet these timings for the device to function correctly.

Special write-access is permitted if:

- SR[AHB_ACC] = 0
- SR[IP_ACC] = 0

Diagram

17-16 —	Reserved
15-12 —	Reserved
11-8 TCSH	Serial flash memory CS hold time This hold time is in terms of serial flash memory clock cycles, and it must be greater than or equal to two flash memory clock cycles . Refer the chip datasheet for the exact value.
7-4 —	Reserved
3-0 TCSS	Serial flash memory CS setup time This setup time is in terms of serial flash memory clock cycles, and it must be greater than or equal to two flash memory clock cycles. Refer the chip Datasheet for the exact value.

79.13.2.5 Buffer 0 Configuration Register (BUF0CR)

Offset

Register	Offset
BUF0CR	10h

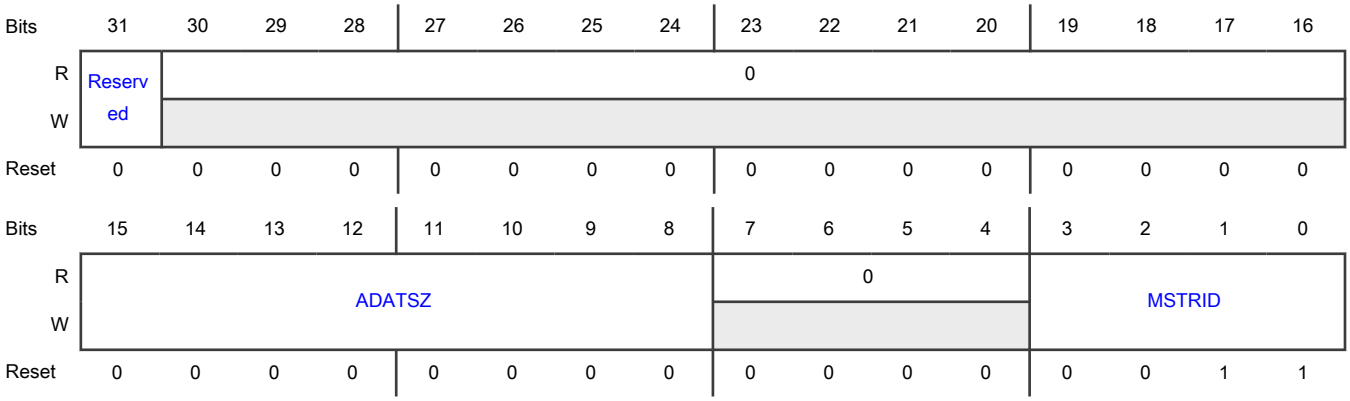
Function

This register provides the configuration for any read access routed to buffer0, which happens when the master ID of the incoming AHB request matches BUF0CR[MSTRID]. Any buffer "miss" leads to a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31 —	Reserved
30-16 —	Reserved
15-8 ADATSZ	AHB data transfer size Defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. For example, a value of 0x2 sets transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. The software should ensure that this transfer size is not greater than the size of the buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 0 Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

79.13.2.6 Buffer 1 Configuration Register (BUF1CR)

Offset

Register	Offset
BUF1CR	14h

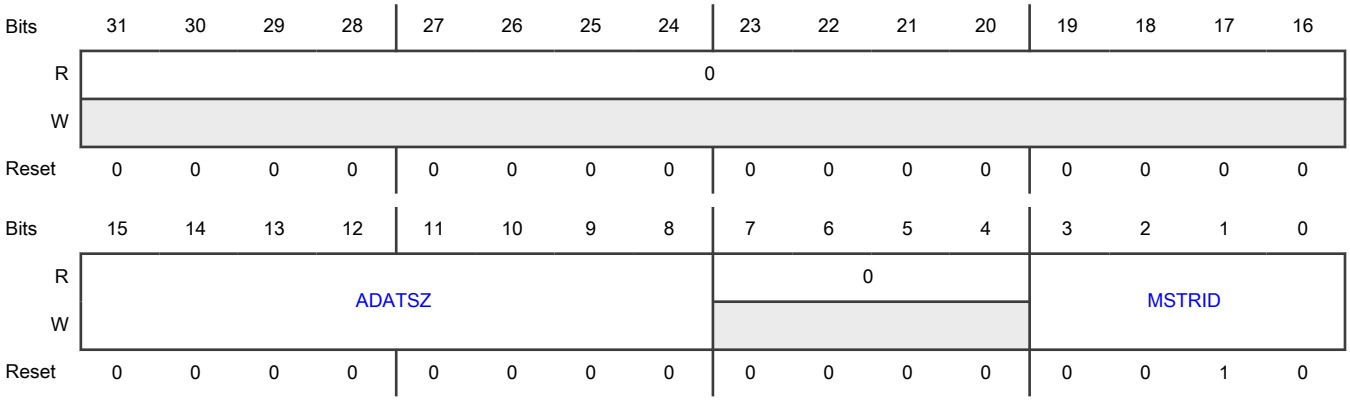
Function

This register provides the configuration for any access routed to buffer 1, which happens when the master ID of the incoming AHB request matches the MSTRID field of this register. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-16 —	Reserved
15-8 ADATSZ	AHB data transfer size This field defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. For example, a value of 0x2 sets the transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. Software should ensure that this transfer size is not greater than the size of this buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 1

Table continues on the next page...

Table continued from the previous page...

Field	Function
	Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

79.13.2.7 Buffer 2 Configuration Register (BUF2CR)

Offset

Register	Offset
BUF2CR	18h

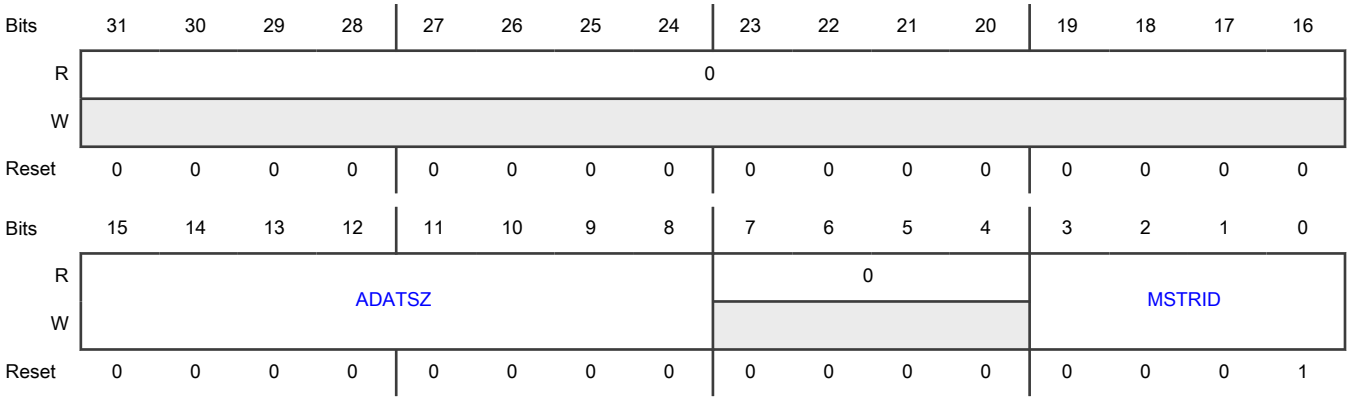
Function

This register provides the configuration for any access routed to buffer 2, which happens when the master ID of the incoming AHB request matches the MSTRID field of this register. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-16 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-8 ADATSZ	AHB data transfer size This field defines the read data transfer size in 8 bytes of an AHB triggered read access to the serial flash memory. For example, a value of 0x2 sets transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. The software should ensure that this transfer size is not greater than the size of this buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID The ID of the AHB master associated with BUFFER2. Any AHB read access with this master ID is routed to this buffer. It must be ensured that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

79.13.2.8 Buffer 3 Configuration Register (BUF3CR)

Offset

Register	Offset
BUF3CR	1Ch

Function

This register provides the configuration for any access to buffer 3.

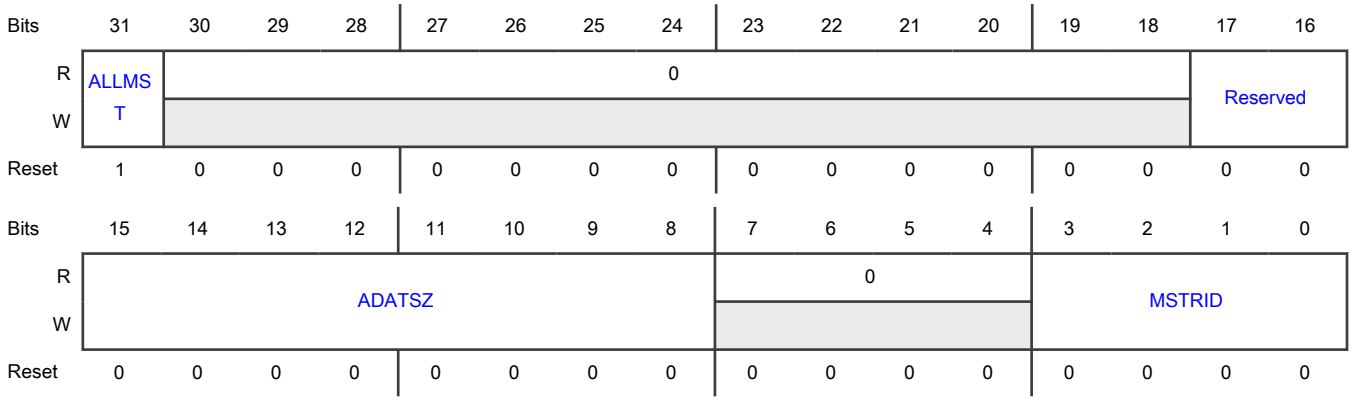
An access is routed to buffer 3 when the master ID of the incoming AHB request matches the MSTRID field of BUF3CR. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

In case the value of the ALLMST field is not 1, any such transaction (where master ID does not match any of the MSTRID fields) is returned with an ERROR response.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31 ALLMST	All master enable When set, buffer3 acts as an all-master buffer. Any AHB access with a master ID not matching with the master ID of buffer0, buffer1, or buffer2 is routed to buffer3. When set, the MSTRID field of this register is ignored.
30-18 —	Reserved
17-16 —	Reserved
15-8 ADATSZ	AHB data transfer size Defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 3. Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

79.13.2.9 Buffer Generic Configuration Register (BFGENCR)

Offset

Register	Offset
BFGENCR	20h

Function

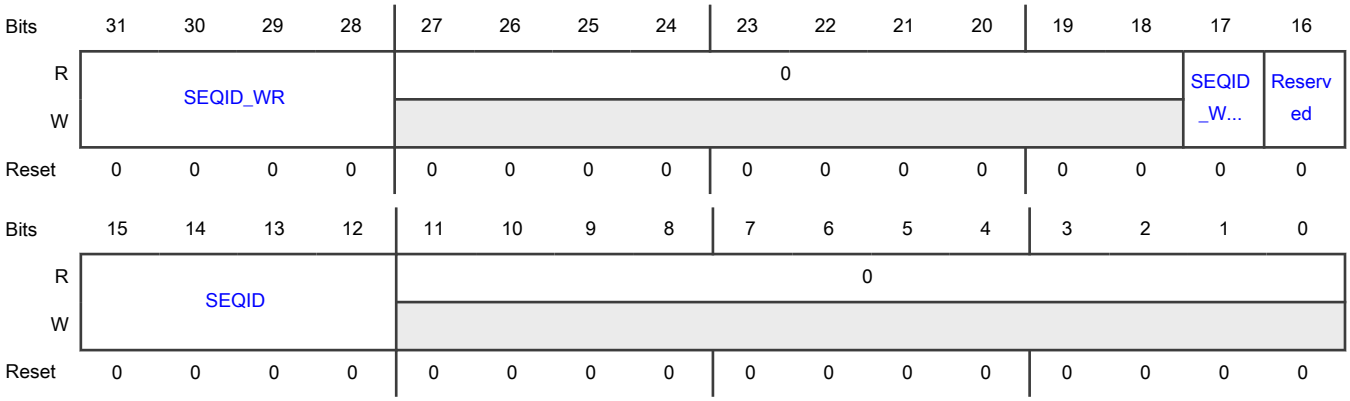
This register provides generic configuration to any of the buffer accesses. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by the SEQID field.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

This register is access controlled and can only be programmed by privilege masters.

Diagram



Fields

Field	Function
31-28 SEQID_WR	Write Sequence ID This field points to write seq-id of LUT and would be selected in case of AHB write transaction, if SEQID_WR_EN==1.
27-18 —	Reserved
17 SEQID_WR_EN	Enable Write Sequence ID
16 —	Reserved
15-12	Points to a sequence in the LUT.

Table continues on the next page...

Table continued from the previous page...

Field	Function
SEQID	This field contains the sequence index of the LUT. and would be selected in case of AHB read transaction (and AHB write transactions if SEQID_WR_EN==0).. See LUT. **NOTE** If the sequence pointer differs in the new and the previous sequences, you should reset it. See sequence pointer clear register for more information.
11-0 —	Reserved

79.13.2.10 SOC Configuration Register (SOCCR)

Offset

Register	Offset
SOCCR	24h

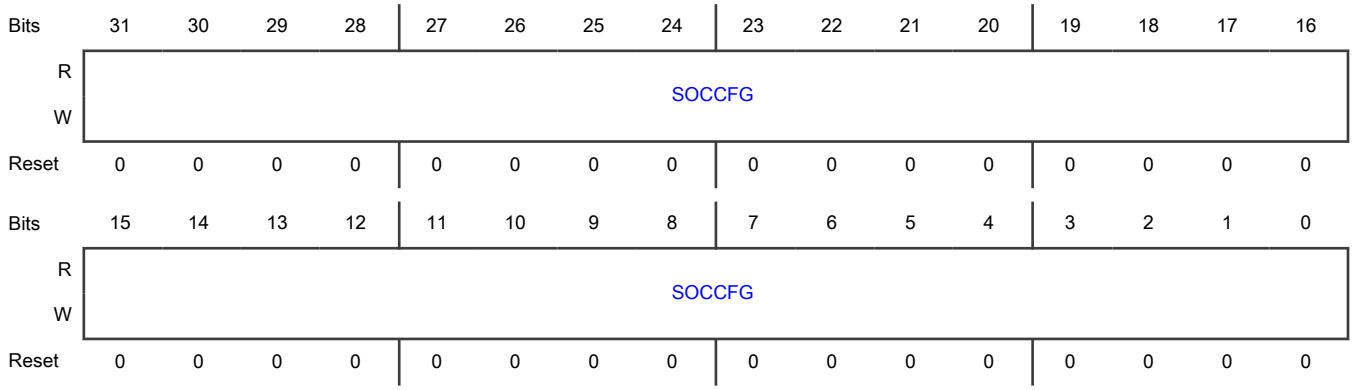
Function

This register is programmed at the chip level for QuadSPI configuration. For details, see chip-specific QuadSPI information.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-0 SOCCFG	SOC configuration This field configuration is specific to chip. For details, see chip-specific QuadSPI information.

79.13.2.11 Buffer 0 Top Index Register (BUF0IND)

Offset

Register	Offset
BUF0IND	30h

Function

This register specifies the top index for buffer 0, which defines its size. Note that the three LSBs of this register are set to 0. This ensures that the buffer is 64-bit aligned because each buffer entry is 64-bits long.

The register value should be set to the desired number of bytes. For example, setting BUF0IND[31:3] to 0 gives 0 bytes, setting the value to 1 gives 8 bytes, and so on.

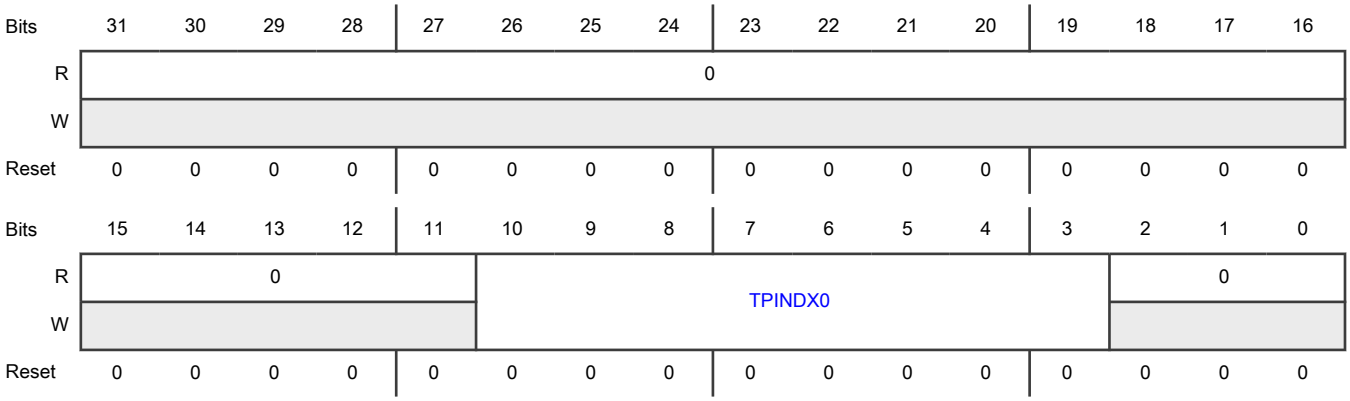
The size of buffer 0 is the difference between BUF0IND and 0.

The software must ensure that the value of TPINDX0 is not greater than the size of buffer 0.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-11 —	Reserved
10-3 TPINDX0	Top index of buffer 0
2-0 —	Reserved

79.13.2.12 Buffer 1 Top Index Register (BUF1IND)

Offset

Register	Offset
BUF1IND	34h

Function

This register specifies the top index of buffer 1, which defines its size. Note that the three LSBs of this register are set to 0. This ensures that the buffer is 64-bit aligned because each buffer entry is 64-bits long.

The size of buffer 1 is the difference between BUF1IND and BUF0IND. The register value should be entered in bytes. For example, if BUF0IND = 0x100, then setting BUF1IND = 0x130 sets the size of buffer 1 to 0x30 bytes.

The software must ensure that the value of TPINDX1 is not greater than the size of buffer 1.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

BUF2IND	38h

Function

This register specifies the top index of buffer 2, which defines its size. Note that the three LSBs of this register are set to 0. This ensures that the buffer is 64-bit aligned because each buffer entry is 64-bits long.

The size of buffer 2 is the difference between BUF2IND and BUF1IND. The register value should be entered in bytes. For example, if BUF1IND = 0x130 then setting BUF2IND = 0x180 sets the size of buffer 2 to 0x50 bytes.

The software must ensure that the value of TPINDX2 is not greater than the size of buffer 2.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

79.13.2.14 AHB Write Configuration Register (AWRCR)

Offset

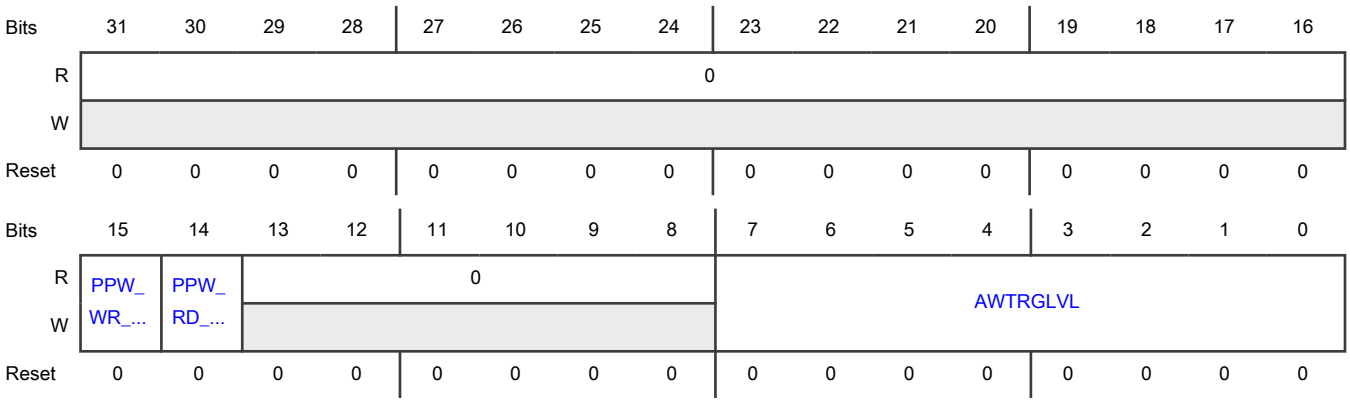
Register	Offset
AWRCR	50h

Function

Special write-access is permitted if:

- SR[AWRACC] = 0

Diagram



Fields

Field	Function
31-16 —	Reserved
15 PPW_WR_DIS	Page program wait write disabled 0b - Enables subsequent writes 1b - Disables subsequent writes to the flash memory. After the first write transaction, AHB write is returned with an error response.
14 PPW_RD_DIS	Page program wait read disabled 0b - Enables subsequent reads 1b - Disables subsequent reads to the flash memory. After the first write transaction, AHB read is returned with an error response.
13-8 —	Reserved
7-0	AHB write trigger level

Table continues on the next page...

Table continued from the previous page...

Field	Function
AWTRGLVL	Defines a trigger level of TX FIFO in terms of a 4-byte entry. AHB write to the flash memory is triggered when either of the following happens: • TX FIFO crosses the level defined by this field • AHB transaction completes This is done to prevent an under run in the flash memory. For HyperRAM, this field must be set to 0. For details, see HyperRAM support

79.13.2.15 DLL Flash Memory A Configuration Register (DLLCRA)

Offset

Register	Offset
DLLCRA	60h

Function

This register configures DLL and slave delay chain for flash memory A.

The value of the DLLEN field must be 1 after all reference (FREQEN, DLL_REFCNTR, DLLRES, SLAVE_AUTO_UPDT) delay chain configurations are programmed.

See DLL and delay chain usage for the programming sequence.

NOTE

See the chip data sheet for information on programming register fields.

NOTE

Please see the chip specific section of QuadSPI DLLCRA register for delay elements data

Diagram

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31 DLLEN	DLL enable 0b - DLL reference logic remains in reset and should be 0 for at least three flash memory clock cycles for reset. 1b - Enables DLL logic. Set it to 1 after all the configuration for DLLCR reference settings is complete.
30 FREQEN	Frequency enable 0b - Selects delay chain for low frequency of operation 1b - Selects delay chain for high frequency of operation
29-28 —	Reserved
27-24 DLL_REFCNTR	DLL reference counter Select the "n+1" interval of DLL phase detection and reference delay updating interval (minimum recommended value = 1).
23-20 DLLRES	DLL resolution Minimum resolution for DLL phase detector to remain locked/unlocked based on flash memory clock jitter. The minimum value is 2, and should be programmed to a more suitable value, such as 6.
19-16 SLV_FINE_OFFSET	Fine offset delay elements in incoming DQS This field sets the number of fine offset delay elements up to 16 in incoming DQS, and the default must be 1 element.
15 —	Reserved
14-12 SLV_DLY_OFFSET	T/16 offset delay elements in incoming DQS This field sets the number of T/16 offset delay elements in incoming DQS; default is 0.
11-8 SLV_DLY_COARSE	Delay elements in each delay tap This field sets the number of delay elements in each delay tap. The field is used to overwrite DLL-generated delay values and works when the value of SLV_DLL_BYPASS is 1. Note : Please refer to the QuadSPI datasheet for more details.
7-5 —	Reserved
4 DLL_CDL8	DLL CDL8 Enable 0b - DLL is implemented to support within 2x variation 1b - DLL is implemented to support within 3x variation (BCS -> WCS)

Table continues on the next page...

Table continued from the previous page...

Field	Function
3 SLAVE_AUTO_UPDT	Slave chain update This field automatically updates the slave chain as soon as DLL is locked. 0b - Auto-update feature is disabled. 1b - Auto-update feature is enabled.
2 SLV_EN	Slave enable 0b - DLL slave logic remains in reset, and its value should be 0 for at least three flash memory clock cycles for reset. 1b - Enables DQS slave delay chain, and should be 1 before any slave configuration settings take place.
1 SLV_DLL_BYPASS	Slave DLL bypass This field enables selection of the number of delays in each slave delay tap. 0b - Disables manual selection of coarse delays in the slave delay chain. 1b - Enables selection of number of delays in each slave delay tap, based on DLLCRA[SLV_DLY_COARSE].
0 SLV_UPD	Slave update You must program this field only after slave delay chain configuration takes place. 0b - Disables any further update on DQS slave delay chain. 1b - Updates the DQS slave delay chain with either ref-delay or bypass slave delay value, and should be set in the absence of the DQS clock.

79.13.2.16 Parity Configuration Register (PARITYCR)

Offset

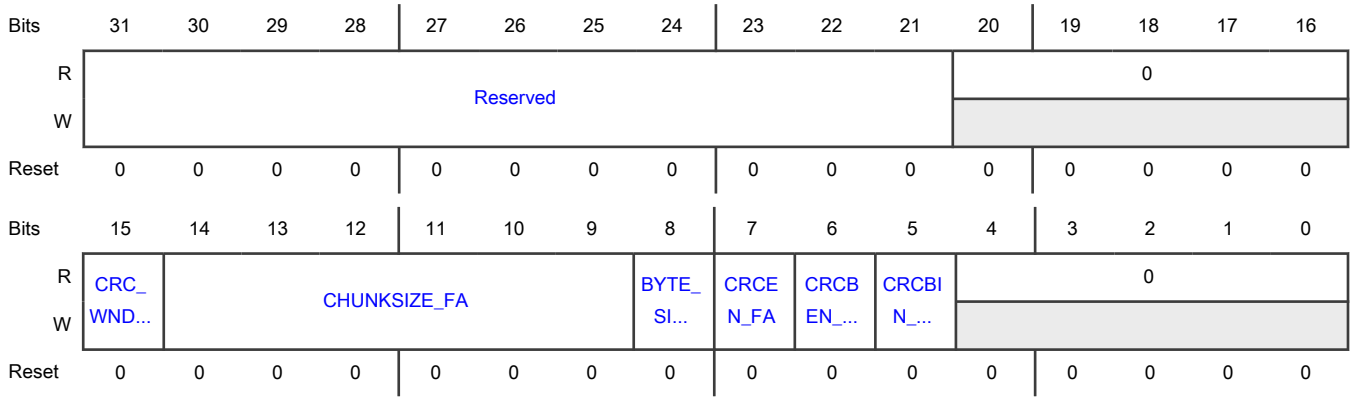
Register	Offset
PARITYCR	6Ch

Function

This register replicates the parity related configuration programming performed on the flash memory configuration registers.

You must write 1 to PARITYCR[CRCEN_FA] and PARITYCR[CRCEN_FB] after all parity configuration bits are programmed. However, you can program PARITYCR[BYTE_SIZE_FA] and PARITYCR[BYTE_SIZE_FB] at any time.

Diagram



Fields

Field	Function
31-21 —	Reserved
20-16 —	Reserved
15 CRC_WNDW_FA	CRC address window configuration 0b - Calculates parity (CRC) over fixed address window within the denoted flash memory A chunk size boundary. 1b - Calculates parity (CRC) over incremental window of flash memory A chunk size, irrespective of address.
14-9 CHUNKSIZE_FA	Chunk size for flash memory A Defines the chunk size (in terms of 4 bytes) after parity is inserted and compared by the QuadSPI controller for flash memory A. Values 0x1, 0x2, and so on indicate 4 bytes, 8 bytes, and so on.
8 BYTE_SIZE_FA	Byte size for flash memory A This field can be programmed any time. It enables single-byte, read/write parity with flash memory A configuration register. The field overrides the chunk size used for flash memory data array. You must write 1 to this field before any read/write operation on the flash memory internal registers. And you must write 0 to this field before reading flash memory data array.
7 CRCEN_FA	CRC parity checker logic 0b - Disables parity mechanism. In case of parity error, set it to 0 to clear parity error. Only supported for DDR Octal commands. 1b - CRC parity checker logic for flash memory A read paths. Configure this field after programming CHUNK_SIZEA, CRCBEN_FA and CRCBIN_FA.
6 CRCBEN_FA	Adds CRC bar parity from flash memory A output to QuadSPI controller

Table continues on the next page...

Table continued from the previous page...

Field	Function
5 CRCBIN_FA	Adds CRC bar parity to flash memory A input from QuadSPI controller
4-0 —	Reserved

79.13.2.17 Serial Flash Memory Address Register (SFAR)

Offset

Register	Offset
SFAR	100h

Function

The module automatically translates this address on the memory map to the address on the flash memory. When operating in a 24-bit mode, only bits 23-0 are sent to the flash memory. In the 32-bit mode, bits 27-0 are used with bits 31-28 driven to 0 when the value of SFACR[CAS] is 0. For example, if the value of SFACR[CAS] is 3, then bits 26-3 are sent to the flash memory as its page address in case flash memory is operating in a 24-bit mode. The total number of address bits requested by the flash memory, as its page and column address, must not be more than 32 bits. See Table 765 for the mapping between the access mode and the SFAR content and Normal mode for details on command triggering and command execution. The software must ensure that the serial flash memory address provided in the SFAR register lies in the valid flash memory address range, as defined in Table 765.

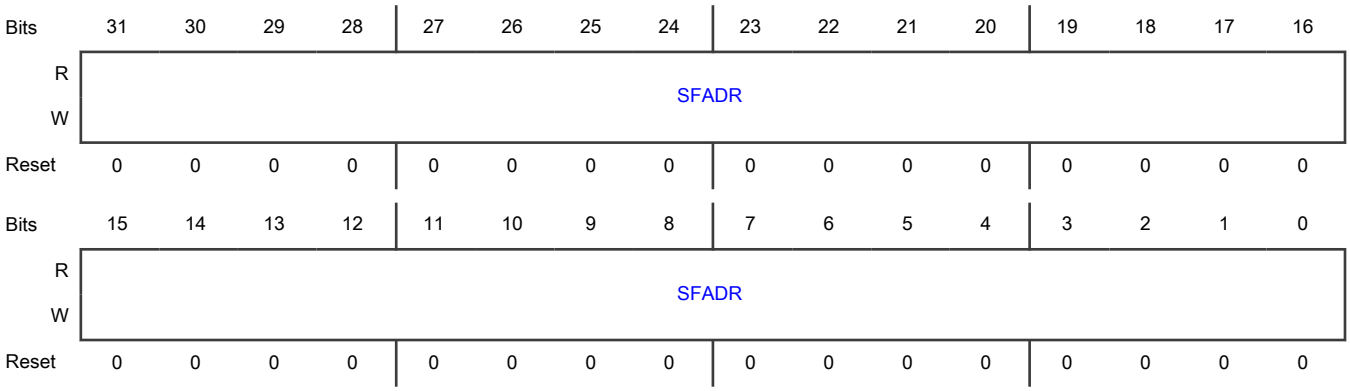
Special write-access is permitted if:

- SR[IP_ACC] = 0

NOTE

If MDAD and FRAD checks are enabled in MGC register but none of the MDAD and FRAD descriptors are valid, then any write on this register will generate a bus transfer error

Diagram



Fields

Field	Function
31-0 SFADR	Serial flash memory address

79.13.2.18 Serial Flash Memory Address Configuration Register (SFACR)

Offset

Register	Offset
SFACR	104h

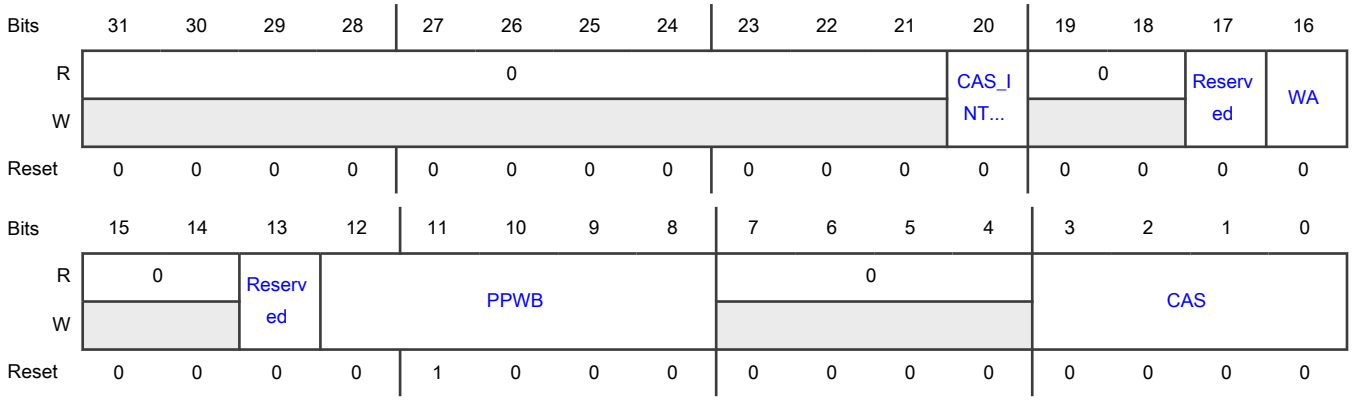
Function

This register contains the address requirements that are specific to serial flash memory. These requirements must be configured according to the connected flash memory, for the controller to function properly. The module automatically translates the address of SFAR on the memory map or the incoming address on the AHB bus to the column address on the flash memory. For example, if a flash memory needs 3 bits as its column address, then only the lower three bits of the SFAR/AHB address are sent to the flash memory as its column address. The software should ensure that the serial flash memory address provided in SFAR or the incoming AHB address lies in the valid flash memory address range.

Special write-access is permitted if:

- SR[IP_ACC] = 0
- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-21 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
20 CAS_INTRLVD	CAS Interleaving 0b - CAS interleaving is disabled 1b - CAS interleaving is enabled
19-18 —	Reserved
17 —	Reserved
16 WA	Word addressable Defines whether the serial flash memory is a byte addressable flash memory or a word addressable flash memory. According to the configuration of this field, the address is remapped to the flash memory interface. See Address scheme for details. 0b - Byte addressable serial flash memory mode 1b - Word (2-byte) addressable serial flash memory mode
15-14 —	Reserved
13 —	Reserved
12-8 PPWB	Page program boundary Flash memory-specific page program boundary size should be programmed in Log2 (size in bytes) format. The default is 8 = log2(256) for a 256-byte page program size.
7-4 —	Reserved
3-0 CAS	Column address space Defines the width of the column address. If the column address is, for example, [2:0] of SFAR/AHB address, then CAS must be 3. If there is no column address separation in any serial flash memory, the value of this field must be specified as 0.

79.13.2.19 Sampling Register (SMPR)

Offset

Register	Offset
SMPR	108h

Function

This register allows configuration of how the incoming data from the external serial flash memory devices is sampled in the QuadSPI module.

NOTE

See the chip data sheet for programming the register fields.

Special write-access is permitted in the disabled mode.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

79.13.2.20 RX Buffer Status Register (RBSR)

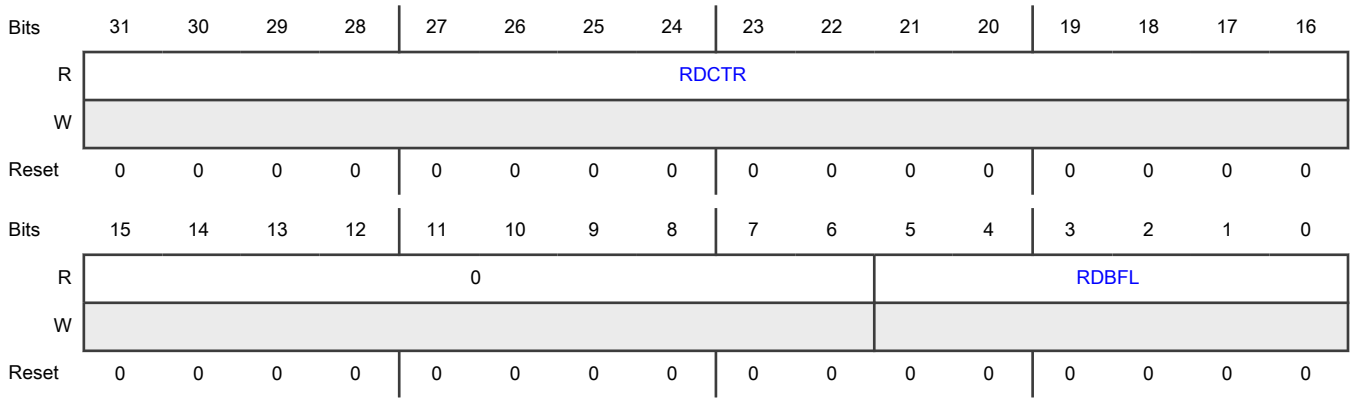
Offset

Register	Offset
RBSR	10Ch

Function

This register contains information related to the receive data buffer.

Diagram



Fields

Field	Function
31-16 RDCTR	Read counter Indicates the number of 4-byte entries removed from the RX buffer. For example, a value of 0x2 indicates that 8 bytes have been removed. It is incremented by the number (RBCT[WMRK] + 1) on RX buffer POP event. The RX buffer can be popped using DMA or FR[RBDF]. The RSER[RBDDE] defines which pop should be pursued. For details, see AHB RX Data Buffer Register (ARDB0 - ARDB31) and Data Transfer from the QuadSPI Module Internal Buffers.
15-6 —	Reserved
5-0 RDBFL	RX buffer fill level Indicates the number of 4-byte entries available in the RX buffer. For example, a value of 0x2 indicates 8 bytes are available.

79.13.2.21 RX Buffer Control Register (RBCT)

Offset

Register	Offset
RBCT	110h

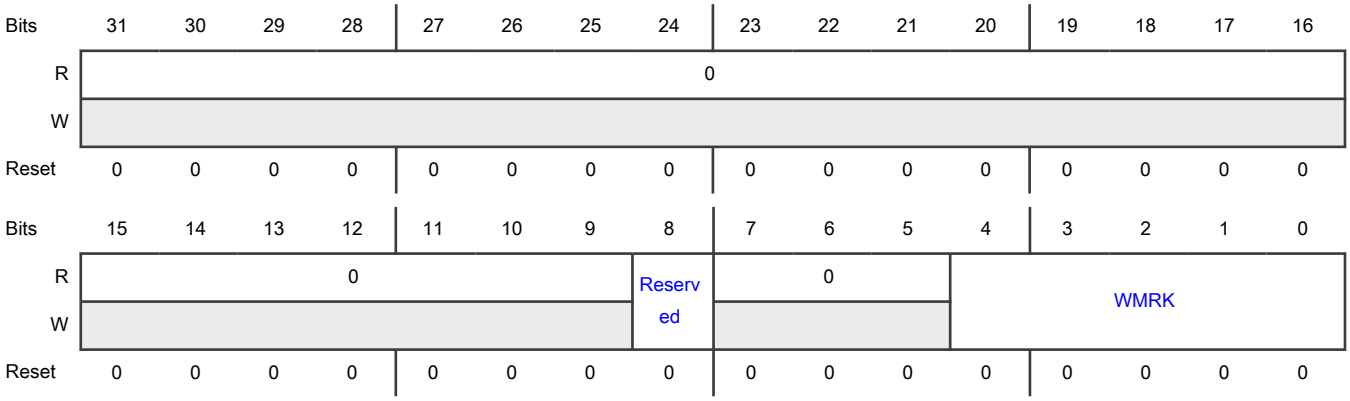
Function

This register contains control data related to the receive data buffer.

Special write-access is permitted if:

- SR[IP_ACC] = 0

Diagram



Fields

Field	Function
31-9 —	Reserved
8 —	Reserved
7-5 —	Reserved
4-0 WMRK	RX buffer watermark This field determines when the readout action of the RX buffer is triggered. When the number of valid entries in the RX buffer is equal to or greater than the number provided by (WMRK+1), the SR[RXWE] flag is asserted. The value should be entered as the number of 4-byte entries minus 1. For example, a value of 0x0 sets the watermark to 4 bytes, 1 to 8bytes, 2 to 12 bytes, and so on. For details, see DMA usage. **NOTE** This field should never be programmed above 31 because there are only 32 memory mapped RBDR registers. If watermark is programmed above 31, data above 32 words will be lost.

14 SLVA_LOCK	Slave high lock status High-frequency slave delay chain locked. The field is configured when the slave decoder is updated with DLLCRA[SLV_UPD] and is reset after you configure SLV_UPD to 0.
13 DLLA_RANGE_ERR	DLL master delay chain The value 1 indicates that DLL master delay chain is working out of delay range because of incorrect DLL configuration.
12 DLLA_FINE_UNDERFLOW	Fine delay chain underflow The value 1 indicates that fine delay chain underflow has occurred.
11-8 —	Reserved
7-4 DLLA_SLV_FINE_VAL	Fine delay cells in slave delay chain This value indicates the total number of fine delay cells (1 delay unit) selected in the slave delay chain.
3-0 DLLA_SLV_COARSE_VAL	Coarse delay cells in slave delay chain This value indicates the total number of coarse delay cells (16 delay units) selected in the slave delay chain.

79.13.2.24 Data Learning Configuration Register (DLCR)

Offset

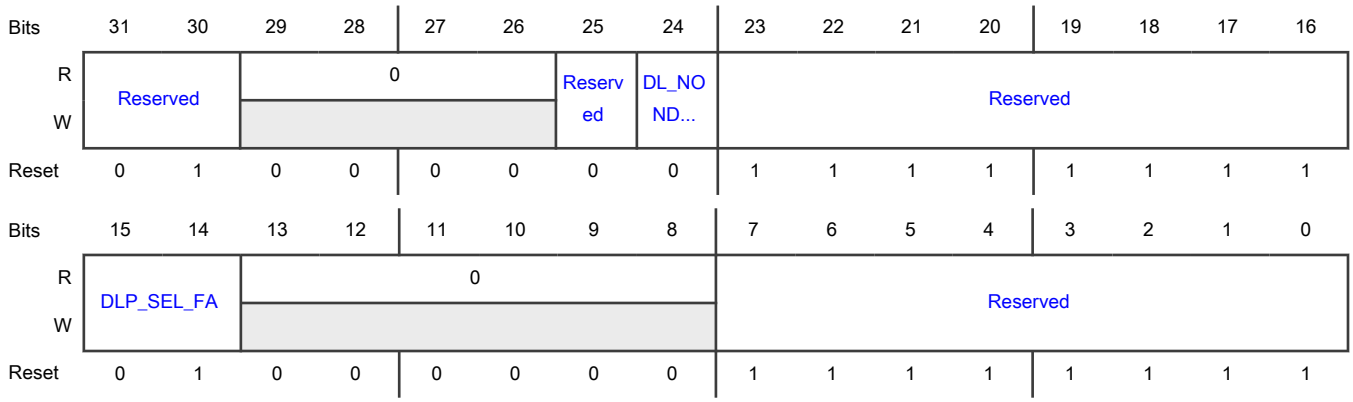
Register	Offset
DLCR	130h

Function

This register is used for programming the data learning settings.

- A flash memory device that supports data learning but cannot provide more than 10 bits of data learn pattern must be considered as non-DLP Flash. For Non-DLP flash devices, you must read at least 16 bits data learn pattern from a known location.
- You must program different learning pattern on the two data pins–IO1 and IO3. This is required to accommodate pessimistic data skew between the different IO lines.

Diagram



Fields

Field	Function
31-30 —	Reserved
29-26 —	Reserved
25 —	Reserved
24 DL_NONDLP_FLSH	Data learning enabled for non-DLP flash memory Configure the value of this field as 1 to enable data learning for flash memories that do not provide a data learning pattern. For a non-DLP flash memory, execute a one-time data learning through the IPS to select a tap before an AHB read operation.
23-16 —	Reserved
15-14 DLP_SEL_FA	Selects pattern matching IO pads 00b - Pattern matching is ignored. This is only for debugging purpose and should not be programmed. 01b - IO1 is used for matching

7-0 NEG_EDGE	DLP negative edge match signature for flash memory A

79.13.2.26 TX Buffer Status Register (TBSR)

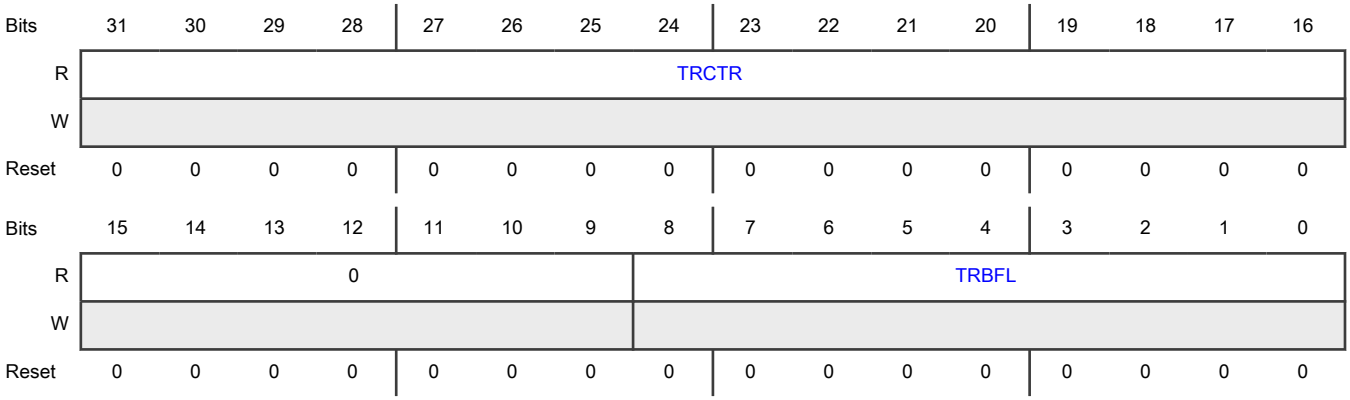
Offset

Register	Offset
TBSR	150h

Function

This register contains information related to the transmit data buffer.

Diagram



Fields

Field	Function
31-16 TRCTR	Transmit counter This field indicates how many entries of 4 bytes have been written into the TX buffer by host accesses. It is reset to 0 when a 1 is written to MCR[CLR_TXF]. It is incremented on each write access to the TBDR register when another word has been pushed onto the TX buffer. When it is not cleared, the TRCTR field wraps around to 0. See TX Buffer Data Register (TBDR) for details.

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-9 —	Reserved
8-0 TRBFL	TX buffer fill level This field contains the number of entries of 4 bytes each available in the TX buffer for the QuadSPI module to transmit to the serial flash memory device. The value of this field can reach maximum up to the total TX buffer size.

79.13.2.27 TX Buffer Data Register (TBDR)

Offset

Register	Offset
TBDR	154h

Function

This register provides access to the circular TX buffer of depth 256, so the total size is 256 * 4 bytes. This buffer provides the data written into it as write data for the page programming commands to the serial flash memory device. See Table 729 for the byte ordering scheme. A write transaction on the flash memory with data size of less than 32 bits leads to the removal of one data entry from the TX buffer. The valid bits are used and the rest of the bits are discarded.

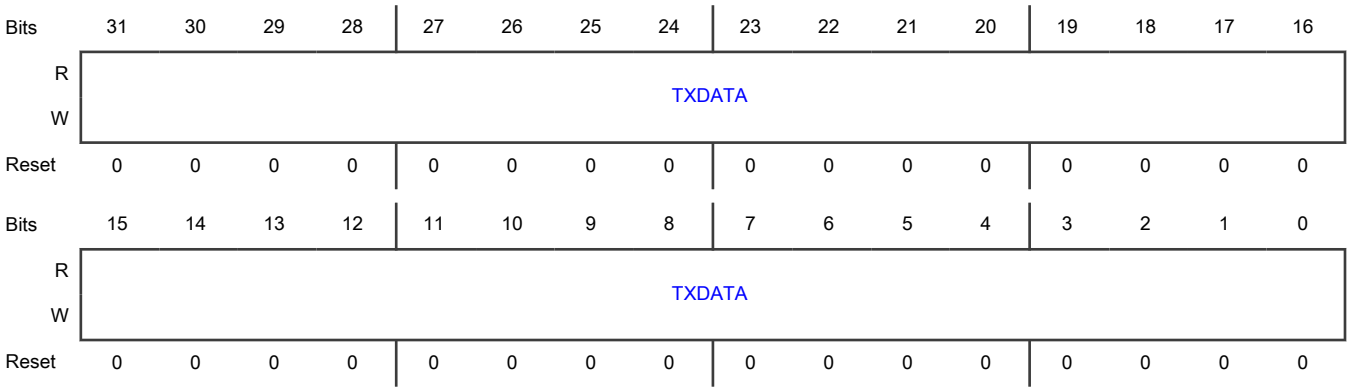
Special write-access is permitted if:

- SR[TXFULL] = 0

NOTE

This register can only be written when write access is granted by SFP block else bus transfer error is generated on write. Please refer to section TBDR register write lock

Diagram



Fields

Field	Function
31-0 TXDATA	TX data On write access, the data is written to the next available entry of the TX buffer and TBSR[TRBFL] is updated accordingly. On a read access, the last data written to the register is returned.

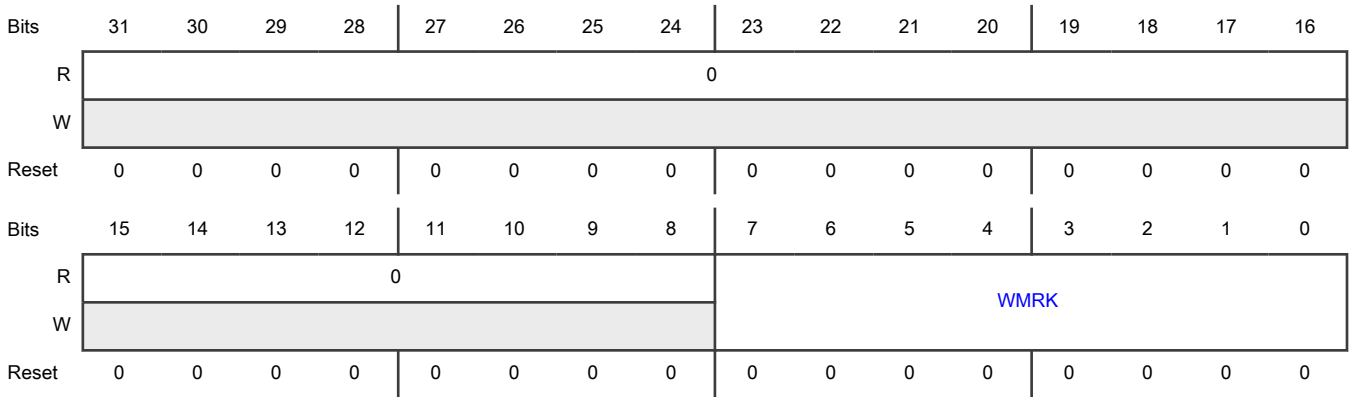
79.13.2.28 TX Buffer Control Register (TBCT)

Offset

Register	Offset
TBCT	158h

Function
This register contains control information for transmit data buffer.

Diagram



Fields

Field	Function
31-8 —	Reserved
7-0 WMRK	Watermark for TX buffer Determines the watermark for the TX buffer When the number of available space in the TX buffer is greater than or equal to the number provided by WMRK (number of 4-byte entries), SR[TXWA] is asserted. For example, a value of 0x1 sets the watermark to 4 bytes, 0x2 sets it to 8 bytes, 0x3 sets it to 12 bytes, and so on. For details, see DMA usage.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	WMRK = 0 is invalid. **NOTE** For IPS write with SFP enabled, this field must be programmed as per formula to prevent TX underflow: If data size in words >1, watermark=(TX FIFO size in words - data size in words) +1, If data size in words =1, watermark=(TX FIFO size in words - data size in words)

79.13.2.29 Status Register (SR)

Offset

Register	Offset
SR	15Ch

Function

This register provides all the available status information about SFM command execution and arbitration, the RX buffer, TX buffer, and the AHB buffer.

Diagram

AHB0FUL	Asserted when the AHB 0 buffer is full
10 AHB3NE	AHB 3 buffer not empty Asserted when the AHB 3 buffer contains data
9 AHB2NE	AHB 2 buffer not empty Asserted when the AHB 2 buffer contains data
8 AHB1NE	AHB 1 buffer not empty Asserted when the AHB 1 buffer contains data
7 AHB0NE	AHB 0 buffer not empty Asserted when the AHB 0 buffer contains data
6 AHBTRN	AHB access transaction pending Asserted when there is a pending request on the AHB interface. See Flash memory mapped AMBA bus.
5 —	Reserved
4 AWRACC	AHB write access Asserted when AHB write access is enabled
3 —	Reserved
2 AHB_ACC	AHB read access Asserted when the currently executed transaction is initiated by the AHB bus
1 IP_ACC	IP access Asserted when transaction currently executed is initiated by the IP bus
0 BUSY	Module busy Asserted when module is currently busy handling a transaction to an external flash memory device

79.13.2.30 Flag Register (FR)

Offset

Register	Offset
FR	160h

Function

This register provides all available flags about SFM command execution and arbitration, which may serve as the source for the generation of interrupt service requests. Note that the error flags in this register do not relate directly to the execution of the transaction in the serial flash memory device itself but only to the behavior and conditions visible in the QuadSPI module.

Special write-access is permitted in the enabled mode.

Fields

Field	Function
31 DLPFF	Data learning pattern failure flag This field is set when the DATA_LEARN instruction is encountered in a sequence, but no sampling point is found for the data learning pattern.
30 —	Reserved
29 —	Reserved
28 DLLABRT	DLL abort 1b - This field is set whenever DLL is unlocked while reading data from the flash memory.
27 TBFF	TX buffer fill flag Before writing to the TX buffer, this field should be cleared. Then, it should be read back. If it is set, the TX buffer can include more data. If the field remains cleared, the TX buffer can be considered as full. See TX buffer operation for details.
26 TBUF	TX buffer underrun flag This field is set if the module tries to pull data when the TX buffer is empty.. The IP command leading to the TX buffer underrun is continued (data sent to the serial flash memory device is undefined). Here, a valid underrun means that it should have occurred during the transaction so that few bytes (that is, less than 4

Table continues on the next page...

Table continued from the previous page...

Field	Function
	bytes) are left in FIFO and the remaining are filled with "FFFFh". This field does not set if transfer is less than 128 bits. The application must clear the TX buffer in response to this event by writing a 1 to MCR[CLR_TXF]. The application must clear the TX buffer in response to this event by writing a 1 to MCR[CLR_TXF].
25 —	Reserved
24 DLLUNLCK	DLL unlock 1b - This field is set whenever DLL unlock event occurs, irrespective of flash memory access.
23 ILLINE	Illegal instruction error flag This field is set when an illegal instruction is encountered by the controller in any of the sequences. As soon as the field is set, you must assert MCR[SWRSTSD] and MCR[SWRSTHD]. That is, reset the flash memory and AHB domain after reconfiguring the correct sequence instruction. See Table 727 for a list of legal instructions.
22-21 —	Reserved
20 —	Reserved
19-18 —	Reserved
17 RBOF	RX buffer overflow flag This field is set when no more data can be pushed into the RX buffer from the serial flash memory device. The IP command leading to this condition is continued until the number of bytes in IPCR[IDATSZ] are read from the serial flash memory device. The content of the RX buffer remains unchanged.
16 RBDF	RX buffer drain flag This field is set if SR[RXWE] is asserted. Writing 1 to this field triggers one of the following actions: • If the RX buffer has up to RBCT[WMRK] valid entries, then the flag is cleared. • If the RX buffer has more than RBCT[WMRK] valid entries and the RSER[RBDDE] field is not set (flag driven mode), an RX buffer POP event is triggered. The flag remains set if the RX buffer contains more than RBCT[WMRK] valid entries after the RX buffer POP event is complete. The flag is cleared if the RX buffer contains less than or equal to RBCT[WMRK] valid entries after the RX buffer POP event is complete.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	See the "Receive Buffer Drain Interrupt or DMA Request" section in Normal mode interrupt and DMA requests for details.
15 AAEF	AHB abort error flag This flag can be set when AHB transaction in ongoing and any of the below conditions occur which may result in AHB error response (HRESP) generation: • When Software abort is asserted from SPTRCLT[ABRT_CLR] during AHB read. • During data learning pattern failure if any AHB transaction is ongoing. (FR[DLPFF]) • CRC or ECC error from flash memory during AHB transaction. (FR[CRCAEF]) • If AIBSEF flag is set during the AHB transfer. (FR[AIBSEF]) Software should clear this flag and other related flags in FR register (mentioned in points above) before initiating any new AHB transfer.
14 AITEF	AHB illegal transaction error flag This is set whenever there is no response generated from QuadSPI to AHB bus in case of an illegal transaction and the watchdog timer expires. The timer value is considered as a parameter.
13 AIBSEF	AHB illegal burst size error flag This is set whenever the total burst size (size x beat) of an AHB transaction is greater than the prefetch data size, which is defined by BUFxCR[ADATSZ] or data size mentioned in the sequence pointed to by the SEQID field in case ADATSZ = 0. See HBURST support with AHB read details on HBURST feature.
12 ABOF	AHB buffer overflow flag This is set when the size of the AHB access exceeds the size of the AHB buffer. This condition can occur only if BUFxCR[ADATSZ] is programmed incorrectly. The AHB command leading to this condition is continued until the number of entries according to BUFxCR[ADATSZ] have been read from the serial flash memory device. The content of the AHB buffer is not changed.
11 —	Reserved
10 CRCAEF	Sets when there is CRC or ECC error for flash memory A 0b - CRCEF interrupt is not generated. 1b - CRCEF interrupt is generated.
9 —	Reserved
8 PPWF	Page-program wait flag after flash memory write flag This field indicates page-program wait flag after flash memory write.
7 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
6 IPIEF	IP command trigger could not be executed error flag This is set when the SR[IP_ACC] and SR[AWRACC] fields are set (that is, an IP triggered command is currently executing) and any of the following conditions occurs: • Write access to the RBCT
5 —	Reserved
4 —	Reserved
3-1 —	Reserved
0 TFF	IP command transaction finished flag This field is set after the QuadSPI module completes a running IP command. If an error occurs, and the related error flags are valid in the same clock cycle, the TFF flag is asserted.

79.13.2.31 Interrupt and DMA Request Select and Enable Register (RSER)

Offset

Register	Offset
RSER	164h

Function

This register provides enables and selectors for the interrupts in the QuadSPI module.

NOTE

Each field of the FR enabled as source for an interrupt prevents the QuadSPI module from entering the Stop mode or Module Disable mode when this flag is set.

Special write-access is permitted in the "Anytime" mode.

79.13.2.32 Sequence Pointer Clear Register (SPTRCLR)

Offset

Register	Offset
SPTRCLR	16Ch

Function

This register provides fields to reset the IP and buffer sequence pointers. The sequence pointer contains the index of instructions within the LUT entry that is to be executed next. For example, if the LUT entry ends on a JMP_ON_CS value of 2, the index is stored as 2.

The software should reset the sequence pointers defined by JMP_ON_CS operand whenever the sequence ID is required to be changed by updating the SEQID field in the IPCR or BFGENCR.

Diagram

Field	Function
31-26 —	Reserved
25-24 —	Reserved
23-20 —	Reserved
19 —	Reserved
18 —	Reserved
17 PREFETCH_DIS	Prefetch disable This field should be configured to disable the prefetch mechanism of receiver. It is not based on dynamic programming. Therefore, it should be programmed initially at once. When this field is set, then during an ongoing flash memory read, any subsequent AHB read is checked for buffer hit. However, after the end of flash memory read, as soon as chip select is deasserted, any subsequent AHB read results in flushing of the current AHB buffer data and issues fresh flash memory transaction if the AHB buffer data is not updated with the flash memory.
16 ABRT_CLR	Flash memory Abort/AHB buffer clear This is a dynamic field. Writing a 1 to it, irrespective of the prefetch disable, clears the AHB buffer pointers and also aborts any ongoing flash memory transaction (if any) and rejects any ongoing AHB read with an error response (if any). QuadSPI sets this field to 0 after clearing the AHB buffer pointers.
15-9 —	Reserved
8 IPPTRC	IP pointer clear This is a self-clearing field. 1b - Clears the sequence pointer for IP accesses as defined in IPCR.
7-1 —	Reserved
0 BFPTRC	Buffer pointer clear This is a self-clearing field. 1b - Clears the sequence pointer for AHB read accesses as defined in BFGENCR.

79.13.2.33 Serial Flash Memory A1 Top Address Register (SFA1AD)

Offset

Register	Offset
SFA1AD	180h

Function

This register provides the address mapping for serial flash memory A1. The difference between SFA1AD[TPADA1] and AMBA_BASE defines the size of the memory map for serial flash memory A1.

Special write-access is permitted if:

- SR[IP_ACC] = 0
- SR[AHB_ACC] = 0

Diagram

R W	DLPV															
Reset	0	0	1	1	0	1	0	0	0	1	0	0	0	0	1	1

Fields

Field	Function
31-0 DLPV	Data learning pattern value This value is used for data learning in the DDR and DQS modes. For example, if you request for more than 32 bits of data learning, the value is repeated in the register. For example, if 64-bit data learning is requested by any flash memory and the value of DLPR is aa55_3443, then the 64-bit value is aa55_3443_aa55_3443. This value is used for data learning in SDR/DDR modes along with DATA_LEARN instruction. Different patterns can be matched at selected IOs. That is, IO1 and IO3 using DLCR[DLP_SEL_FA], DLPR[31:16] for IO3, and DLPR[15:0] for IO1. DLP pattern for IO1 and IO3 should be stored, bit-wise, in the little endian format. For details, see Data learning.

79.13.2.36 Flash Memory A Failing Address Status Register (FAILA_ADDR)

Offset

Register	Offset
FAILA_ADDR	194h

Function

This register provides the flash memory address where data learning or parity error has occurred.

79.13.2.37 RX Buffer Data Register (RBDR0 - RBDR31)

Offset

For a = 0 to 31:

Register	Offset
RBDRa	200h + (a × 4h)

Function

These registers provide access to individual entries in the RX buffer. See Table 729 for the byte ordering scheme.

RBDR0 corresponds to the actual position of the read pointer within the RX buffer. The number of valid entries available depends on the number of RX buffer entries implemented and on the number of valid buffer entries available in the RX buffer.

Example 1 - RX buffer filled completely with 32 words: In this case, the address range for valid read access extends from RBDR0 to RBDR31 RBDR63.

Example 2 - RX buffer filled with five valid words: RX buffer fill level of RBSR[RDBFL] is 5. In this case, access to RBDR4 provides the last valid entry.

Any access beyond the range of valid RX buffer entries provides undefined results.

0 LOCK	Lock LUT Locks the LUT when the following conditions are met: • This register is written just after the LUT Key Register (LUTKEY). • The LUT key register is written with the 0x5AF05AF0 key.

79.13.2.40 LUT Register (LUT0)

Offset

Register	Offset
LUT0	310h

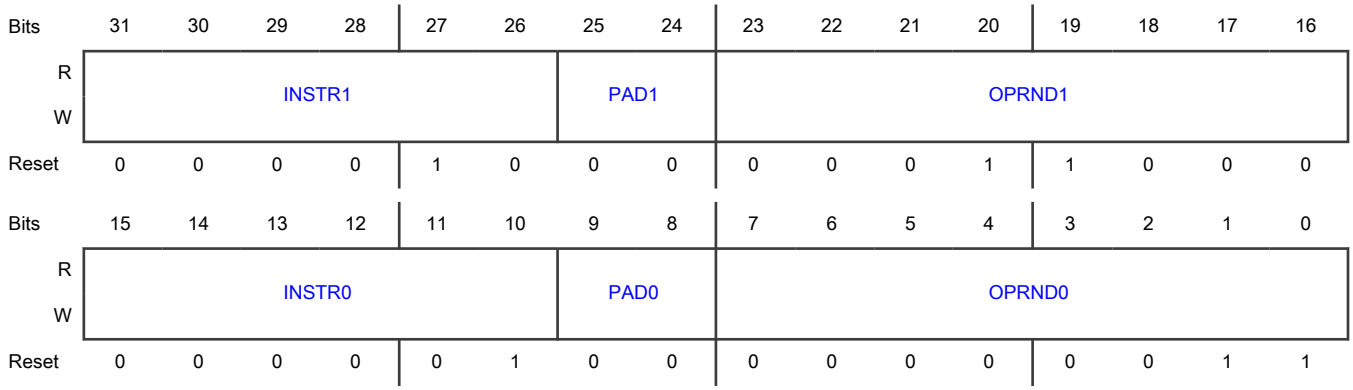
Function

A sequence of instruction-operand pairs may be pre-populated in the LUT according to the device connected on board. Each instruction-operand pair is of 16 bits (2 bytes) each. Every sequence preprogrammed by Program Sequence Engine in the LUT is referred to by its index. The LUT registers act as lookup tables for sequences of instructions. The programmable sequence engine executes the instructions in these sequences to generate a valid serial flash memory transaction. There are a total of 80 LUT registers. These 80 registers are divided into groups of 5 registers that make a valid sequence. Therefore, LUT[0], LUT[5], LUT[10] ..... LUT[75] are the starting registers of a valid sequence. Each of these sets of 5 registers can have a maximum of 10 instructions. Reset value of the register shown below is only applicable to LUT2 to LUT79. A maximum of 16 sequences can be defined at one time. See LUT that describes the LUT registers in detail.

Special write-access is permitted if the LUT is unlocked.

This register is access controlled and can only be programmed by privilege masters. Last six LUT SEQID locations should be used for programming SEQID for atomic commands (where flash's internal config region is accessed) like flash erase etc. where data transfer is not required. These 6 SEQID can be send to QSPI using only FRAD0 and can't be qualified using any other FRAD. For details, see Atomic commands considerations.

Diagram



Fields

Field	Function
31-30 —	Reserved
29-24 EALO	Exclusive Access Lock Owner When FRAD*n*_WORD3[EAL] = 11, this field indicates the domain/master ID that owns the exclusive access lock.
23-6	Reserved

Table continues on the next page...

<table>
<tr><th>Field</th><th>Function</th></tr>
<tr><td>—</td><td></td></tr>
<tr><td>5-3: MD1ACP
2-0: MD0ACP</td><td>Master Domain Access Control Policy
This field define the access restrictions for respective Master Domain 0 and 1 corresponding to this FRAD region. Write permissions are decided based on secure and privilege attributes of current transaction. Read access is not restricted. This field can not be programmed if MDAD registers are not valid. If EAL is being written in same cycle (10 or 11), or if FRAD_WORD3 [LOCK] bits are written as 11. If LOCK bits are written as 10 then this field can be programmed only if Master ID matches the ID check of respective MDAD queue. If MDAD descriptor is not valid then respective MDxACP also becomes read-only.
Table 764. Field value mapping

<tr><td>100</td><td>Read/Write</td><td>Read/Write</td><td>Read</td><td>Read</td></tr>
<tr><td>0xx</td><td>Read</td><td>Read</td><td>Read</td><td>Read</td></tr>
</table>
NOTE
The software must program the value 101 for MDACP fields for FRAD0 as this FRAD has access to all the atomic instructions. For details, see Atomic commands considerations.</td></tr>
</table>

79.13.2.46 Flash Region Lock Control (FRAD0_WORD3 - FRAD7_WORD3)

Offset

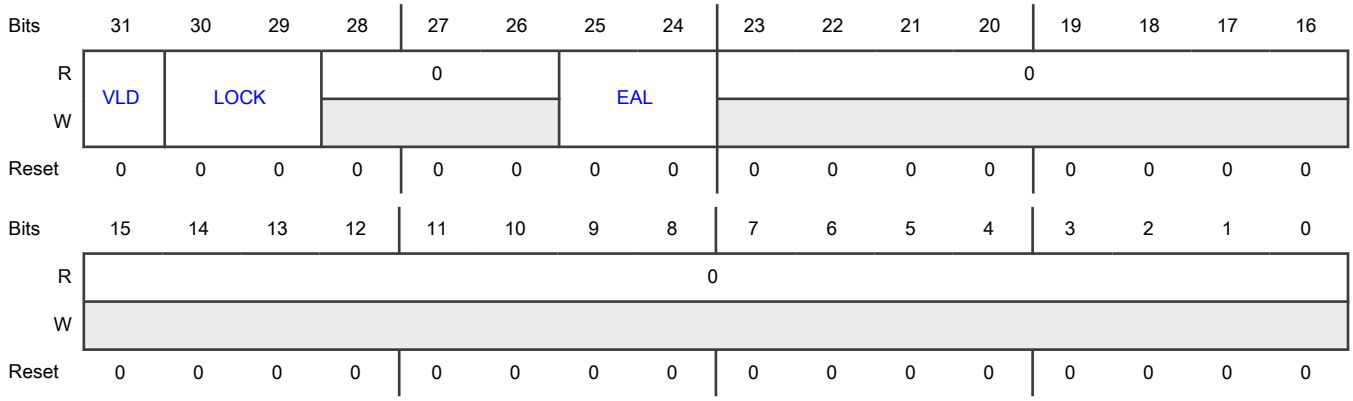
For n = 0 to 7:

Register	Offset
FRADn_WORD3	80Ch + (n × 20h)

Function

This register is access controlled and can only be programmed by privilege masters.

Diagram



Fields

Field	Function
31 VLD	Valid This field indicates whether the FRAD Descriptor for a specific flash region is valid. This field can not be written in same cycle if EAL field is being written as 10 or 11. **NOTE** You must enable this field after programming FRAD0_WORD0, FRAD0_WORD1, FRAD0_WORD2 and FRAD0_WORD3 registers. 0b - FRAD-Assignment is invalid 1b - FRAD-Assignment is valid
30-29 LOCK	Descriptor Lock This field enables masking of accidental write on FRAD registers. Lock is enabled/disabled by Secure/ Privileged master. Lock functionality does not affects the EAL bits of FRAD. They can still be written even if FRAD descriptors are locked. 00b-01b - Lock disabled. Descriptor registers can be written by any master 10b - Lock enabled. Descriptors are read-only. MDnACP fields can be programmed only by the master with ID matching the MID check of their respective Target group MDAD. If the Target group MDAD is not valid then MDnACP fields also become read-only. 11b - Lock enabled. Descriptor registers are read-only.
28-26 —	Reserved
25-24 EAL	Exclusive Access Lock This field provides exclusive write lock over a FRAD region based on MD*n*ACP. 00b - No lock. Write permissions available for all masters based on their MDxACP evaluation. 01b - NA

Table continues on the next page...

Table continued from the previous page...

Field	Function
	10b - Lock enabled. Write permissions revoked for all domains. It can only be changed to 11b and can't directly be changed to 00b. 11b - Lock enabled. Exclusive write permission for master with master ID given in FRADn_WORD3[EALO] fields based on its MDxACP evaluation. Write disabled for other masters. Exclusive lock can be taken by a master only if it its ID matches the master ID check of any of the MDAD target queue, which is valid. MDxACP field corresponding to that target queue is not programmed as 0b. when a master writes 11b on this field it will be written only if above condition is met and then the master ID will be stored in FRADn_WORD3[EALO]. No transfer error will be generated in case the master does not satisfies the check.
23-0 —	Reserved

79.13.2.47 Flash Region Compare Address Status (FRAD0_WORD4 - FRAD7_WORD4)

Offset

For n = 0 to 7:

Register	Offset
FRADn_WORD4	810h + (n × 20h)

Function

This register is access controlled and can only be programmed by privilege masters.

NOTE

Any write access to these registers will result in bus transfer error

Fields

Field	Function
31-0 CMP_ADDR	Capture Address This field indicates the 32-bit start address of the last transaction which lies inside the address range of this FRAD descriptor.

79.13.2.48 Flash Region Compare Status Data (FRAD0_WORD5 - FRAD7_WORD5)

Offset

For n = 0 to 7:

Register	Offset
FRADn_WORD5	814h + (n × 20h)

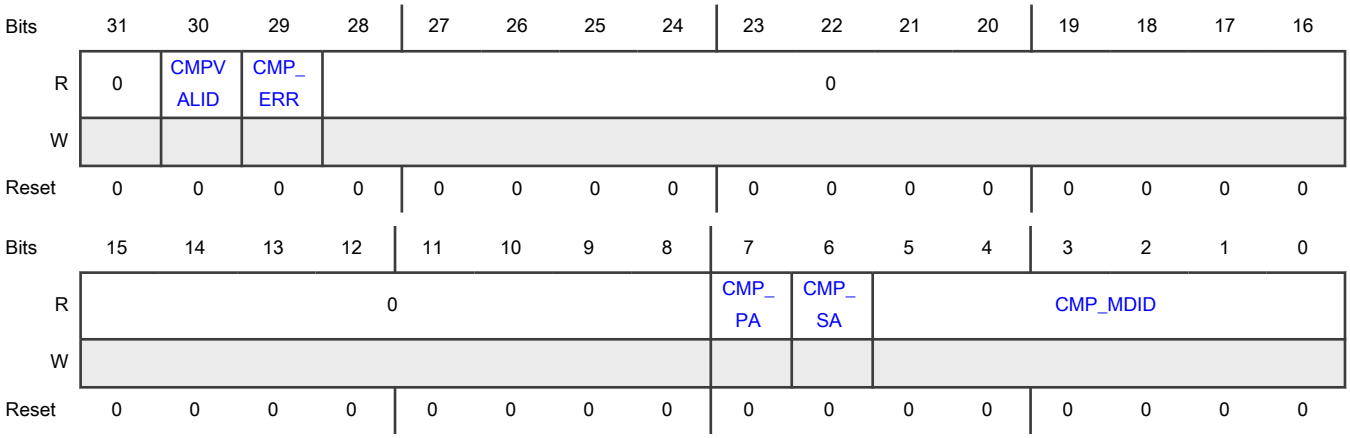
Function

This register is access controlled and can only be programmed by privilege masters.

NOTE

Any write access to these registers will result in bus transfer error

Diagram



Fields

Field	Function
31 —	Reserved
30 CMPVALID	Comparison Valid This field indicates the validity of flash region specific comparison check.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Access result/status not available 1b - Access result/status is available
29 CMP_ERR	Comparison Error This field indicates the error status (based on secure/privilege attributes checked with MDxACP permissions or exclusive access lock as programmed in FRAD) for flash region specific comparison check for last transaction. When this field is set, it can be cleared by writing '1' to W1C field of ERRSTAT register. It will update new value only after the error field has been cleared. 0b - No error 1b - Access error
28-8 —	Reserved
7 CMP_PA	Capture Privilege Attribute Capture Privilege attribute of last transaction which passed the address check for this FRAD. 0b - Non-privilege transaction 1b - Privilege transaction
6 CMP_SA	Capture Secure Attribute Capture Secure attribute of last transaction which passed the address check for this FRAD. 0b - Non-secure transaction 1b - Secure transaction
5-0 CMP_MDID	Capture MDID Value Capture master ID (MDID) value of the last transaction which passed the address check for this FRAD.

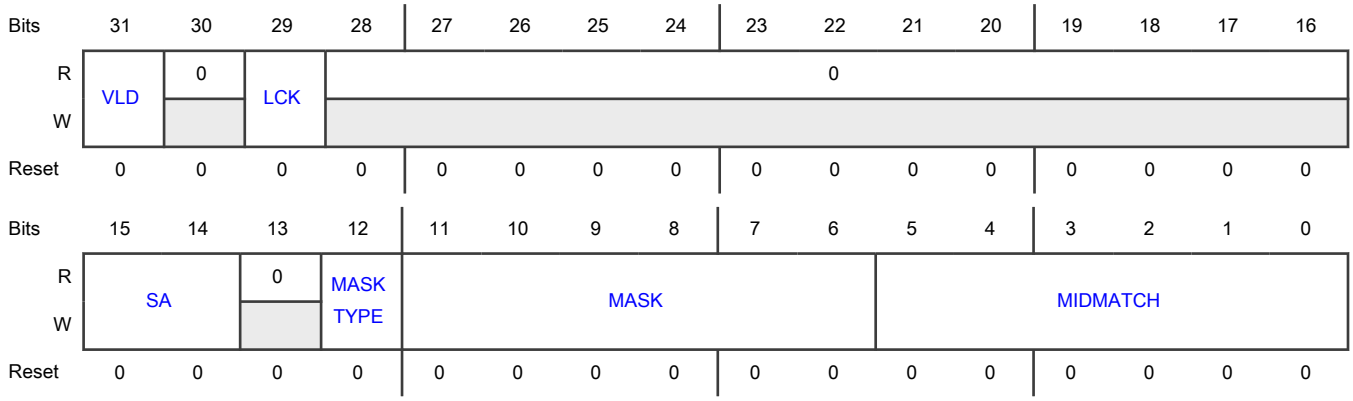
79.13.2.49 Target Group n Master Domain Access Descriptor (TG0MDAD - TG1MDAD)

Offset

Register	Offset
TG0MDAD	900h
TG1MDAD	910h

Function
This register is access controlled and can only be programmed by privilege masters.

Diagram



Fields

Field	Function
31 VLD	Valid Indicates whether MDAD Descriptor for the target group *n* is valid. 0b - MDAD-Assignment is invalid 1b - MDAD-Assignment is valid
30 —	Reserved
29 LCK	Descriptor Lock This field provides a means to make the MDAD descriptor read-only. 0b - Lock disabled. Registers can be written. 1b - Lock enabled. Registers are read-only.
28-16 —	Reserved
15-14 SA	Secure Attribute Defines the secure attribute selection criteria for entry into descriptor queue.. 00b - NA. This option should not be used. Allows the bus attribute for this master to non-secure only 01b - Allow the bus attribute for this master to non-secure only 10b - Allow the bus attribute for this master to secure only 11b - Allow the bus master's attribute: Both secure and non-secure
13 —	Reserved
12	Mask Type

Table continues on the next page...

Table continued from the previous page...

Field	Function
MASKTYPE	0b - ANDed mask 1b - ORed mask
11-6 MASK	Mask Defines the 6-bit mask value for the ID-Match comparison
5-0 MIDMATCH	Master ID Reference Specifies the reference value of the Master-ID (MID) for MID-comparison

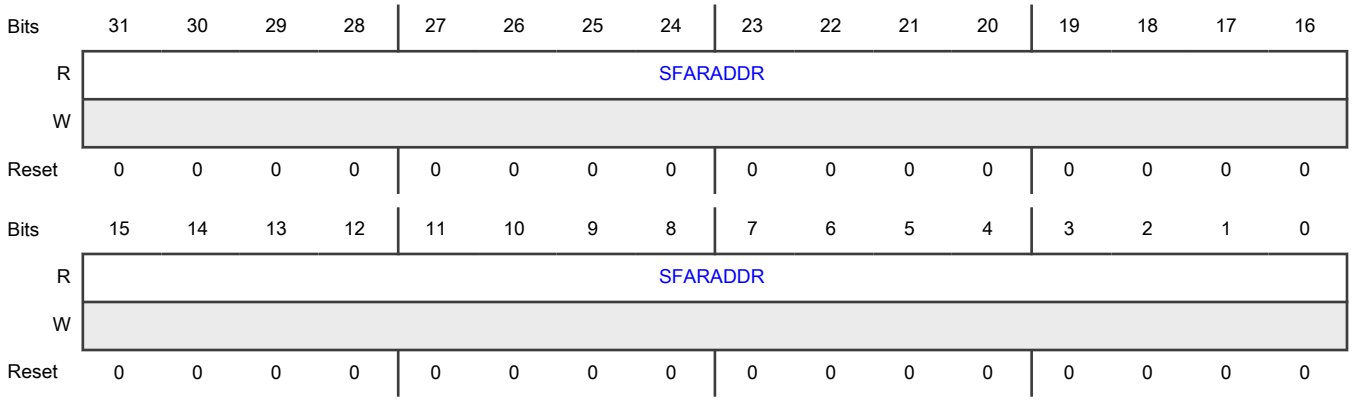
79.13.2.50 Target Group n SFAR Address (TG0SFAR - TG1SFAR)

Offset

Register	Offset
TG0SFAR	904h
TG1SFAR	914h

Function
Flash memory start address of the transaction in this target group queue.

Diagram



Fields

Field	Function
31-0 SFARADDR	SFAR Address Flash memory start address of the transaction which qualified into this target group queue.

79.13.2.51 Target Group n SFAR Status (TG0SFARS - TG1SFARS)

Offset

Register	Offset
TG0SFARS	908h
TG1SFARS	918h

Function

Target group *n* SFAR status.

NOTE

This register can only be read if the master reading the register passes the security checks set in TGnMDAD[SA] fields or if MDAD descriptor is not valid. Else this register will be read as 0. It will also read as 0 if TGnMDAD[SA] bits in descriptor are set as 00.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	0			PA	0	SA	0				TG_MID					
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31 VLD	Valid Indicates whether the SFAR Address for the target group *n* is valid and queue is busy. This bit will not be set when ERR bit is set. 0b - SFAR-Assignment is invalid 1b - SFAR-Assignment is valid
30 ERR	Error Indicates whether the SFAR address stored by a Master is with required access attributes for this target group descriptor. 0b - SFAR with required attributes 1b - SFAR without required attributes

Table continues on the next page...

Table continued from the previous page...

Field	Function
29 CLR	Clear Clears the SFAR Status register. This register can only be cleared by the master having security attribute defined by TG*n*MDAD[SA]. After clearing if there is any valid transaction present in MDAD queue, it will again get updated in this register else it will be cleared. It will not be cleared if TGxMDAD[SA] bits are set to 00.
28-13 —	Reserved
12 PA	Privileged Attribute Privilege attribute of the master which wrote the SFAR register. 0b - Non-privileged 1b - Privileged
11 —	Reserved
10 SA	Secure Attribute Secure attribute of the master which wrote the SFAR register. 0b - Non-secure 1b - Secure
9-6 —	Reserved
5-0 TG_MID	Transaction Master ID Indicates the Master-ID of a transaction which programmed the SFAR registers with required attributes.

79.13.2.52 Target Group n IPCR Status (TG0IPCRS - TG1IPCRS)

Offset

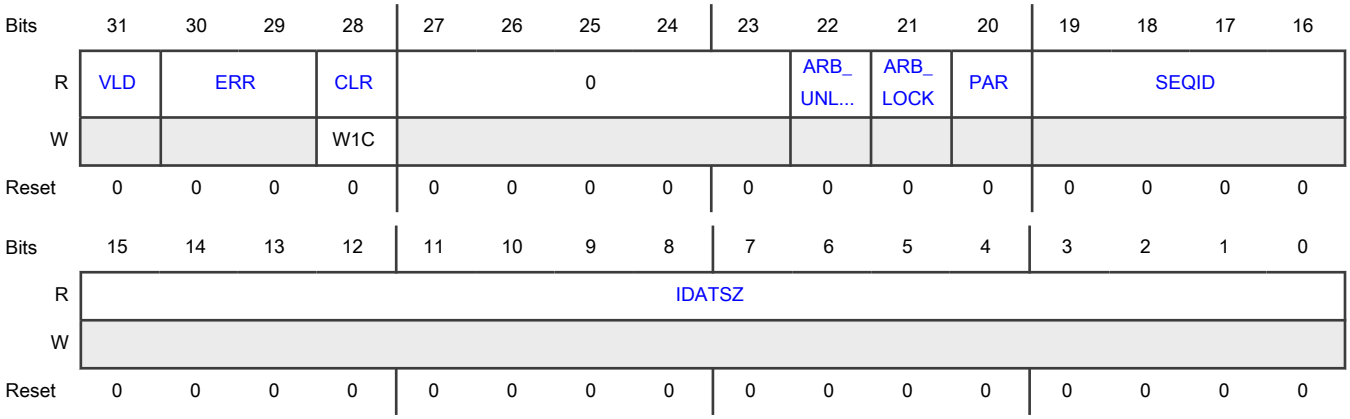
Register	Offset
TG0IPCRS	90Ch
TG1IPCRS	91Ch

Function
Target group *n* IPCR status.

NOTE

This register can only be read if the master reading the register passes the security checks set in TGnMDAD[SA] fields or if MDAD descriptor is not valid. Else this register will be read as 0. It will also read as 0 if TGnMDAD[SA] bits in descriptor are set as 00.

Diagram



Fields

Field	Function
31 VLD	Valid Indicates whether the IPCR-IDATZ, IPCR-SEQID and PAR stored in this target group queue is valid and queue is locked. This bit will not be set in case ERR is set. 0b - IPCR-assignment is invalid 1b - IPCR-assignment is valid and queue is locked.
30-29 ERR	Error Indicates whether the IPCR stored by a Master with required access attributes wrt target group MDAD 00b - IPCR programming with required attributes 01b - IPCR-DATZ programming without required attributes 10b - IPCR-SEQID programming without required attributes 11b - IPCR-DATZ and SEQID both programming without required attributes
28 CLR	Clear Clears the status in IPCR Status register. This register can only be cleared by the master having security attribute defined by TGnMDAD[SA]. After clearing if there is any valid transaction present in MDAD queue it will again get updated in this register else it will be cleared. It will not be cleared if TGxMDAD[SA] bits are set to 00.
27-23 —	Reserved
22	Arbitration Unlock

Table continues on the next page...

Table continued from the previous page...

Field	Function
ARB_UNLOCK	Specifies if the arbitration unlock is requested for TGn. 0b - No effect 1b - Arbitration unlock is requested
21 ARB_LOCK	Arbitration Lock Specifies if the arbitration lock is requested for TGn. 0b - No effect 1b - Arbitration lock is requested
20 PAR	Parallel Mode Enable Value Indicates the parallel mode enable value programmed in the target group queue.
19-16 SEQID	SEQID Value Indicates the SEQID value programmed in target group queue.
15-0 IDATSZ	IDATSZ Value Indicates the IDATSZ value programmed in target group queue.

79.13.2.53 Master Global Configuration (MGC)

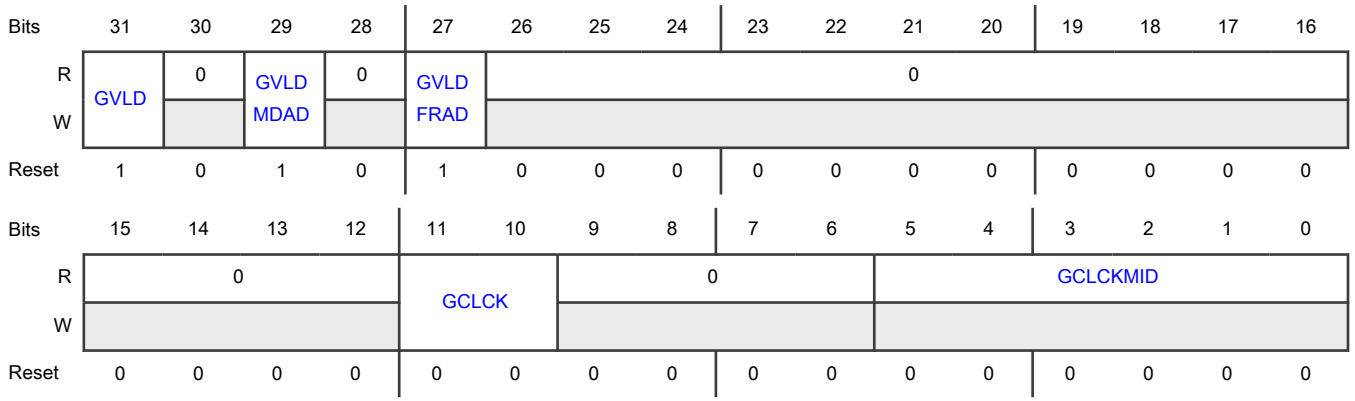
Offset

Register	Offset
MGC	920h

Function

This register is access controlled. It can only be programmed by master with master ID equal to 000011b. For MGC, MRC and MTO registers access checks master ID is being used. For transaction level checks inside MDAD and FRAD domain IDs are being used.

Diagram



Fields

Field	Function
31 GVLD	Global Valid access control 0b - Access controls are disabled. No descriptor comparison check. All transactions are allowed. 1b - Access controls are enabled.
30 —	Reserved
29 GVLDMDAD	Global Valid MDAD 0b - MDADs are disabled 1b - MDADs are enabled
28 —	Reserved
27 GVLDFRAD	Global Valid FRAD 0b - FRADs are disabled 1b - FRADs are enabled
26-12 —	Reserved
11-10 GCLCK	Global Configuration Lock This field provides a mechanism to limit write access to descriptors specific registers (MGC, MRC and MTO registers). 00b - Global Lock disabled. Registers can be written based on individual register access attribute. 01b - NA 10b - Lock enabled. Only the global configuration lock owner can write to the registers. 11b - Lock enabled. All registers are read only until unlocked
9-6 —	Reserved
5-0 GCLCKMID	Global configuration Lock Owner Status This fields specifies the 6-bit Master-ID of Global configuration Lock owner (which set MGC[GCLCK]=10). Input value of Global Master-ID is provided by sideband signals.

79.13.2.54 Master Read Command (MRC)

Offset

Register	Offset
MRC	924h

Function

This register is access controlled. It can only be programmed by master with master ID equal to 000011b.

NOTE

In case of Sequence Auto Join instruction in LUT, SFP will parse only first sequence. Second sequence will not be parsed for checking Read commands.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15 —	Reserved
14-12 FRAD	Flash Region Descriptor Number Flash Region specific number (FRAD) of last executed FlashSeq request. This will remain 0 in case of read transfers.
11 —	Reserved
10 ARB_LOCK	Arbitration Lock Arbitration lock status for last completed request. 0b - Arbitration was not locked 1b - Arbitration was locked
9 PA	Privilege Attribute Privilege attribute of last executed FlashSeq request. 0b - Non-privilege Transaction 1b - Privilege Transaction
8	Secure Attribute

Table continues on the next page...

Table continued from the previous page...

Field	Function
SA	Secure attribute of last executed FlashSeq request. 0b - Non-secure Transaction 1b - Secure Transaction
7 —	Reserved
6 REQ_TG	FlashSeq Request Target Group Target group queue from which last executed transaction passed. 0b - TG0 1b - TG1
5-0 REQ_MID	FlashSeq Request Master ID Indicates the master-ID of last executed FlashSeq request.

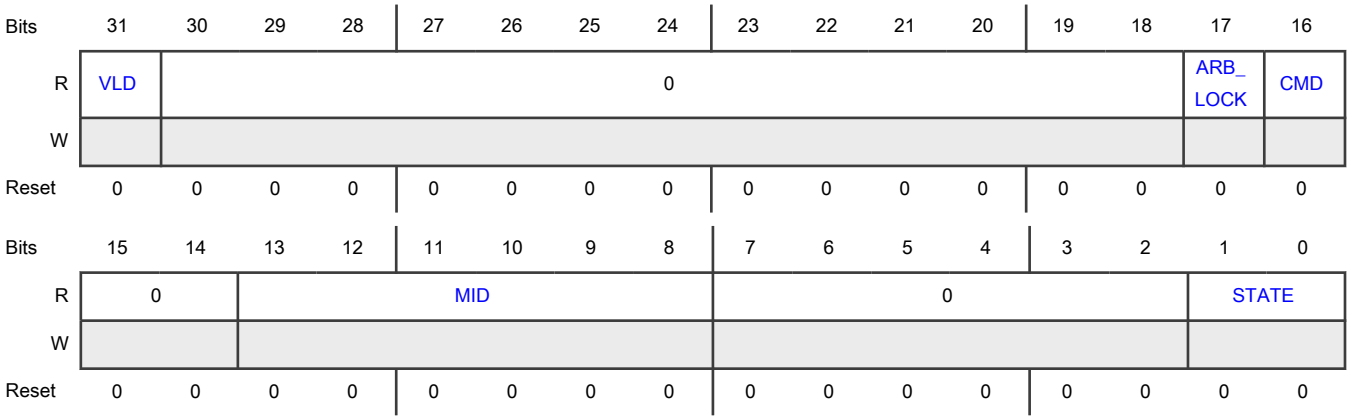
79.13.2.57 FSM Status (FSMSTAT)

Offset

Register	Offset
FSMSTAT	930h

Function
This register is access controlled and can only be programmed by privilege masters.

Diagram



Fields

Field	Function
31 VLD	Valid Indicates whether the FSM Status is valid. 0b - Status is invalid. No IPS transfer is queued. 1b - Status is valid. IPS transfer is queued or execution on QuadSPI.
30-18 —	Reserved
17 ARB_LOCK	Arbitration Lock Arbitration lock status for present request. 0b - Arbitration not locked 1b - Arbitration locked
16 CMD	Command Instruction type of currently initiated Flash transaction on QuadSPI. 0b - Read instruction sequence 1b - Non-read instruction sequence
15-14 —	Reserved
13-8 MID	Master ID Indicates the Master-ID of the currently initiated FlashSeq transaction on QuadSPI.
7-2 —	Reserved
1-0 STATE	FSM State Status 00b - Transaction is Queued, but QuadSPI is busy with AHB transfer, any previous DMA transaction is ongoing, any residue data left in RDBFL or if any interrupt is pending.. 01b - TBDR lock is open. IPS master can write in TBDR. 10b - Write transfer is triggered. SEQID is written to QuadSPI. 11b - Read transfer is triggered. SEQID is written to QuadSPI.

79.13.2.58 IPS Error (IPSERROR)

Offset

Register	Offset
IPSERROR	934h

Function

This register contains the error status of IPS write on SFAR or IPCR registers if they are not qualified for any of the target group queues.

This register is access controlled and can only be programmed by privilege masters.

Diagram

	1b - Transaction does not lie within any FRAD address range and error is generated

79.13.2.60 Interrupt Enable (INT_EN)

Offset

Register	Offset
INT_EN	93Ch

Function

This register is access controlled and can only be programmed by privilege masters.

NOTE

In case Queue Specific Error Interrupt bits (TG0SFAR,TG1SFAR,TG0IPCR,TG1IPCR) are enabled, ensure that the core executing interrupt handler can clear the Queue specific TGxSFARS and TGxIPCRS registers only when core's security attribute matches the queue. In case there is a mismatch in security attribute, you must change the TGMDADx.SA attribute of that queue to match the core SA attribute. After that, core can clear the error and then revert the changes in TGMDADx.SA field.

79.13.3 Serial flash memory address assignment

The serial flash memory address assignment can be modified by writing into Serial Flash Memory A1 Top Address Register (SFA1AD) and Serial Flash Memory A2 Top Address Register (SFA2AD) for device A

Table 765. Serial flash memory address assignment

Parameter	Function	Access mode
QuadSPI_AMBA_BASE ((31:10) - 22 bits)	QuadSPI AHB base address First address of the serial flash memory device as presented to the QuadSPI controller. This might be the base of the serial flash memory in the system address map or it may be a remapping, for instance to 0h, performed by the system. (See the system address map file attached to this document)	
QuadSPI_ARDB_BASE	First address of the QuadSPI Rx buffer on system memory map	

Table continues on the next page...

Table 765. Serial flash memory address assignment (continued)

Parameter	Function	Access mode
TOP_ADDR_MEMA1(TPADA1)	Top address for the external flash memory A1 (the first of the two independent flash memories sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA1 and QuadSPI_AMBA_BASE is routed to serial flash memory A1.
TOP_ADDR_MEMA2(TPADA2)	Top address for the external flash memory A2 (the second of the two independent flash memories sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA2 and TOP_ADDR_MEMA1 is routed to serial flash memory A2.

79.14 Flash memory mapped AMBA bus

QuadSPI_AMBA_BASE defines the address to be used as the start address of the serial flash memory device, as defined by the system memory map. Note that this may be a remapping of the physical address of the serial flash memory in the system. See the system address map for details.

Table 766. QuadSPI AMBA bus memory map

Address	Register name
QuadSPI_AMBA_BASE to (TOP_ADDR_MEMA2 - 1h)	• See Memory-mapped serial flash memory data—individual flash memory mode on flash memory A. • For information about byte ordering, see Table 729 and Table 730.
QuadSPI_ARDB_BASE to... (32 * 4 Byte) QuadSPI_ARDB_BASE + 1FFh	• See AHB RX Data Buffer Register (ARDB0 - ARDB31). • For information about the byte ordering, see Table 729.

NOTE

Any read access to non-implemented addresses provides undefined results.

In individual flash memory modes, the 3/4 address bytes (as programmed in the instruction/operand in the sequence) available for the flash memory address are determined by SFADR[23:0] or SFADR[31:0] as provided in the table shown above.

79.14.1 AHB bus access read considerations

Note that all logic in the QuadSPI module implementing the AHB bus access is designed to read the content of an external serial flash memory device. Therefore, the following restrictions apply to the QuadSPI module with respect to accesses to the AHB bus:

- AHB bus read access types—NONSEQ and BUSY—are fully supported.
- AHB read access type—SEQ—is treated in the same way as NONSEQ. See Flash memory mapped AMBA bus for details.
- Early burst termination is not supported for AHB transactions.
- An AHB error response is provided on occurrence of:
  - Parity error
  - ECC error from flash memory
  - Data learning failure

  Also, interrupts (if enabled) are provided along with the AHB error response.

- An AHB error response occurs when FR[AITEF] bit is set
- An AHB bus stall along with error response occurs when FR[AAEF] bit is set

79.14.2 Memory-mapped serial flash memory data—individual flash memory mode on flash memory A

Starting with address QuadSPI_AMBA_BASE, the content of the first external serial flash memory device is mapped into the address space of the device containing the QuadSPI module. Serial flash memory byte address 0h corresponds to bus address, QuadSPI_AMBA_BASE, in an increasing order. . See the following table for the address mapping. The byte ordering for 32-bit access is provided in Table 729 and for 64-bit read access, the byte ordering is provided in Table 730.

Table 767. Memory-mapped individual flash memory mode—flash memory A address scheme

Memory-mapped address 32-bit access	Memory-mapped address 64-bit access	Serial flash memory byte address	Flash memory device
QuadSPI_AMBA_BASE + 0h	QuadSPI_AMBA_BASE + 0h	0h to 3h	A1
QuadSPI_AMBA_BASE + 4h		4h to 7h	
...	...	...	
TOP_ADDR_MEMA1 - 8h	TOP_ADDR_MEMA1 - 8h	(TOP_ADDR_MEMA1- 8h) to (TOP_ADDR_MEMA1 - 0h4 -0h1)	
TOP_ADDR_MEMA1 - 4h		(TOP_ADDR_MEMA1 - 4h) to (TOP_ADDR_MEMA1 - 0h1)	
TOP_ADDR_MEMA1 + 4h	TOP_ADDR_MEMA1 + 0h	0h to 3h	A2
TOP_ADDR_MEMA1 + 0h4		4h to 7h	
...	...	...	
TOP_ADDR_MEMA2 - 8h	TOP_ADDR_MEMA2 - 8h	(TOP_ADDR_MEMA2 - 8h) to (TOP_ADDR_MEMA2 - 4h - 1h)	
TOP_ADDR_MEMA2 - 4h		(TOP_ADDR_MEMA2 - 4h) to (TOP_ADDR_MEMA2 - 1h)	

The available address range depends on the size of the external serial flash memory device. Any access beyond the size of the external serial flash memory provides undefined results.

For details concerning the read process, see Flash memory read.

79.14.3 ARDB register descriptions

NOTE

See the system memory map in this document for the base address of the QuadSPI AHB RX data buffer.

79.14.3.1 ARDB memory map

QuadSPI_S32K358_ARDB base address: 6800_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h - 7Ch	AHB RX Data Buffer Register (ARDB0 - ARDB31)	32	R	0000_0000h

79.14.3.2 AHB RX Data Buffer Register (ARDB0 - ARDB31)

Offset

For a = 0 to 31:

Register	Offset
ARDBa	0h + (a × 4h)

Function

This register is used to read the buffer content of the RX buffer from successive addresses. ARDB0 corresponds to the RX buffer register entry corresponding to the current value of the read pointer in an increasing order.

The increment of the read pointer depends on the access scheme (DMA or flag-driven). See Flash memory read, RX buffer, data read through register interface, and AHB read for the description of successive accesses to the RX buffer content. See Byte Ordering of Serial Flash Memory Read Data for the byte ordering scheme.

Valid address range accessible in the ARDB*n* range depends on the number of RX buffer entries implemented and on the number of valid buffer entries available in the RX buffer.

- Example 1 - RX buffer filled completely with 32 words: In this case, the address range for valid read access extends from ARDB0 to ARDB31 .
- Example 2 - RX buffer filled with five valid words; RX buffer fill level RBSR[RDBFL] is 5. In this case, an access to ARDB4 provides the last valid entry.

Chapter 80
Quad Serial Peripheral Interface (QuadSPI) for S32K388 and S32K389

80.1 Chip-specific QuadSPI information

80.1.1 QuadSPI configuration

Table 768. QuadSPI instances

Instance	S32K388/S32K389	S32K310/S32K311/S32K312
QuadSPI	Yes	No

Table 769. QuadSPI configuration details

Configuration	S32K388/S32K389
QuadSPI Tx FIFO size	256 words
QuadSPI Rx FIFO size	32 words
Look Up Table Size	16 words
Rx Buffer	1024 Bytes

For supported data rates, see device Datasheet.

NOTE

- Boot from QuadSPI is not supported but execution from external memory is supported.
- SoC generate secure access from all CM7 core to QuadSPI.

Table 770. Features supported

Feature	S32K388/S32K389
AHB Write	No
Data learning feature	No
DLL	Yes
OTFAD (On-the-fly-AES-decryption engine)	No
DDR mode	No
HyperRAM	No
HyperFlash	No
External DQS (Data Strobe)	No
Boot from QuadSPI interface	No

The following block diagram depicts the QuadSPI Flash A Interface.

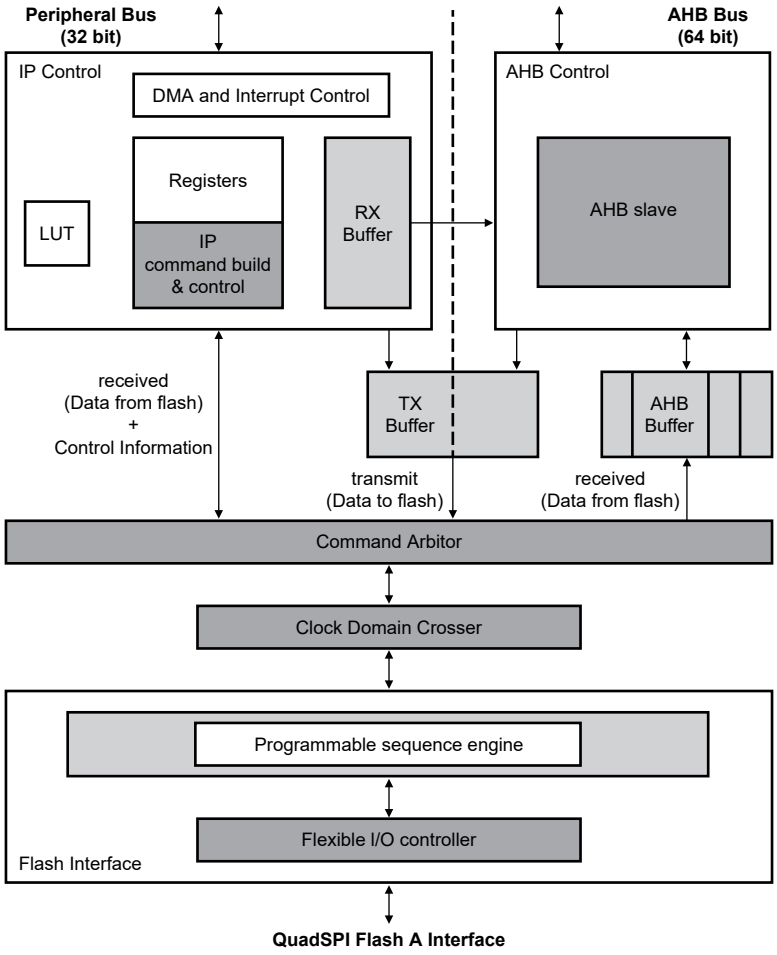

Figure 520. Block diagram

80.1.2 Supported read modes

The table below provides an overview of the QuadSPI read modes.

Table 771. QuadSPI read modes

Read modes		SDR support (QuadSPI_MCR [DDR_EN]=0)	QuadSPI_MCR [DQS_EN]	QuadSPI_MCR [DQS_FA_SEL]	Data learning support	DLL
DQS sampling method	Pad loopback	Yes	1	01	No	Yes

80.1.3 QuadSPI initialization sequence

Following initialization sequence should be followed for proper QuadSPI operation:

- Enable QuadSPI module by MC_ME peripheral clock enable (register PRTNx_COFBy_CLKEN present within MC_ME). Refer MC_ME chapter for peripheral mapping.
- Configure the SIUL2 registers MSCR[OBE] as 1 and MSCR[SSS] as 0 for QuadSPI_SCKFA pin.
- Initialize QuadSPI SCKFA by writing a sequence of 1010 to the SIUL2 register GPDO[PDO_a] for QuadSPI_SCKFA pin.

- Configure the SIUL2 register MSCR[OBE] back as 0 for the pins.
- Initiate a dummy flash read to reset all DQS flops by itself and any crossing from DQS domain to IPS/AHB is taken care by CDC logic.
- Initiate a peripheral software reset to QuadSPI controller by writing to QuadSPI controller's MCR.
- Post this initialization sequence, the QuadSPI will work in intended deterministic manner.

NOTE

QuadSPI initialization is to be done before using QuadSPI after each functional reset.

80.1.4 Pad clock loopback

This chip supports pad clock loopback. The QuadSPI can be configured to use clock loopback to sample input data. SCK is delayed by the SCK pin output delay, plus the SCK pin input delay using pad loopback, and is configured by setting QuadSPI config registers SOCCR[SOCCFG] and MCR[DQS_FA_SEL]. Enabling the loopback version of SCK can improve the setup time of the input data from the Flash.

For details of these register, see QuadSPI register descriptions.

80.1.5 QuadSPI SOC Configuration register SOCCR[SOCCFG] implementation

The QuadSPI SOC Configuration register QuadSPI_SOCCR[SOCCFG] register is used to control dummy loopback pads and obe_pull_timing_relax_b. Below is the description of it's bits:

Table 772. SOCCR[SOCCFG] implementation

Bit	Description
Bit[0]	obe_pull_timing_relax_b : enables the timing relaxation by pulling obe for pad 1 for half cycle, if 0 then enabled else disabled.
Bit[1]	ibe of QSPIA_SCK_DUMMY pad. 0: Disable input receiver 1: Enable input receiver.
Bit[2]	obe of QSPIA_SCK_DUMMY pad. 0: Disable output driver 1: Enable output driver.
Bit[3]	dse of QSPIA_SCK_DUMMY pad. 0: Disable drive strength 1: Enable drive strength.
Bit[4]	pue of QSPIA_SCK_DUMMY pad. 0: Disable internal pullup or pulldown resistor 1: Enable internal pullup or pulldown resistor.
Bit[5]	pus of QSPIA_SCK_DUMMYpad. 0: Enable internal pulldown resistor if pue is set 1: Enable internal pullup resistor if pue is set.
Bit[6]	sre of QSPIA_SCK_DUMMY pad. 0: Disable slew rate control 1: Enable slew rate control.
Bit[31:7]	Reserved

To Enable the Quadspi dummy PAD loopback use following settings

For Flash-A: MCR[DQS_FB_SEL] = 0x2

SOCCR[SOCCFG] = 0x0000000E (ibe=1, obe=1, dse=1 and sre=0)

NOTE

S32K3xx SoCs does not support dual die flashes. Hence, the signal PCSFA2 from QuadSPI is not used.

80.1.6 QuadSPI AHB Buffer write access control

In S32K388/S32K389 the QuadSPI AHB buffer does not support writes. A write to QuadSPI AHB buffer results in error response from QuadSPI.

QuadSPI might behave unexpectedly in case if its AHB buffer is written with QuadSPI MCR[MDIS] =1. In cases wherein QuadSPI is disabled with above MDIS control bit, XRDC must also be appropriately configured to block the accesses to QSPI AHB buffer and indicate an error response.

80.2 Introduction

The QuadSPI module acts as an interface to a single serial flash memory device, with up to four bidirectional data lines.

80.2.1 Features

QuadSPI supports the following features:

- Flexible sequence engine to support various flash memory vendor devices. As there is no specific standard, the module supports various kinds of flash memories from different vendors. See Serial flash memory devices for example sequences.
- Single, dual, and quad modes of operation supported for Quad flash memories
- AHB master to read RX buffer data through AMBA AHB (64-bit width interface) or IPS registers space (32-bit access) and fill TX buffer via IPS registers space (32-bit access)
  - AHB master can be a DMA with a configurable inner loop size
- Multi-master accesses are allowed
  - Flexible and configurable buffer for each master—total available buffer size is 1024 bytes.
- All AHB accesses to flash/RAM memory devices are directly memory mapped to the chip system memory
- Programmable sequence engine to cater to future command/protocol changes and ability to support all existing vendor commands and operations. The software needs to select the corresponding sequence according to the connected flash memory device.
  - Support for all types of addressing

80.2.2 RX buffer push event

To add the valid entries into the RX buffer

By default, each buffer push event adds two entries to the RX buffer because the interface to the serial clock domain is 64 bits in width. Depending on the number of bytes read from the serial flash memory device, it is possible for the very last buffer push event that only one entry is added.

RBSR[RDBFL] is incremented by the number of entries added to the RX buffer.

80.2.3 RX buffer POP event

To remove valid entries from the RX buffer

Each buffer POP event removes (RBCT[WMRK] + 1) valid entries from the buffer. BSR[RDBFL] is decremented by the same number and RBSR[RDCTR] is incremented accordingly.

80.2.4 Block diagram

The following figure shows a block diagram of the QuadSPI module.

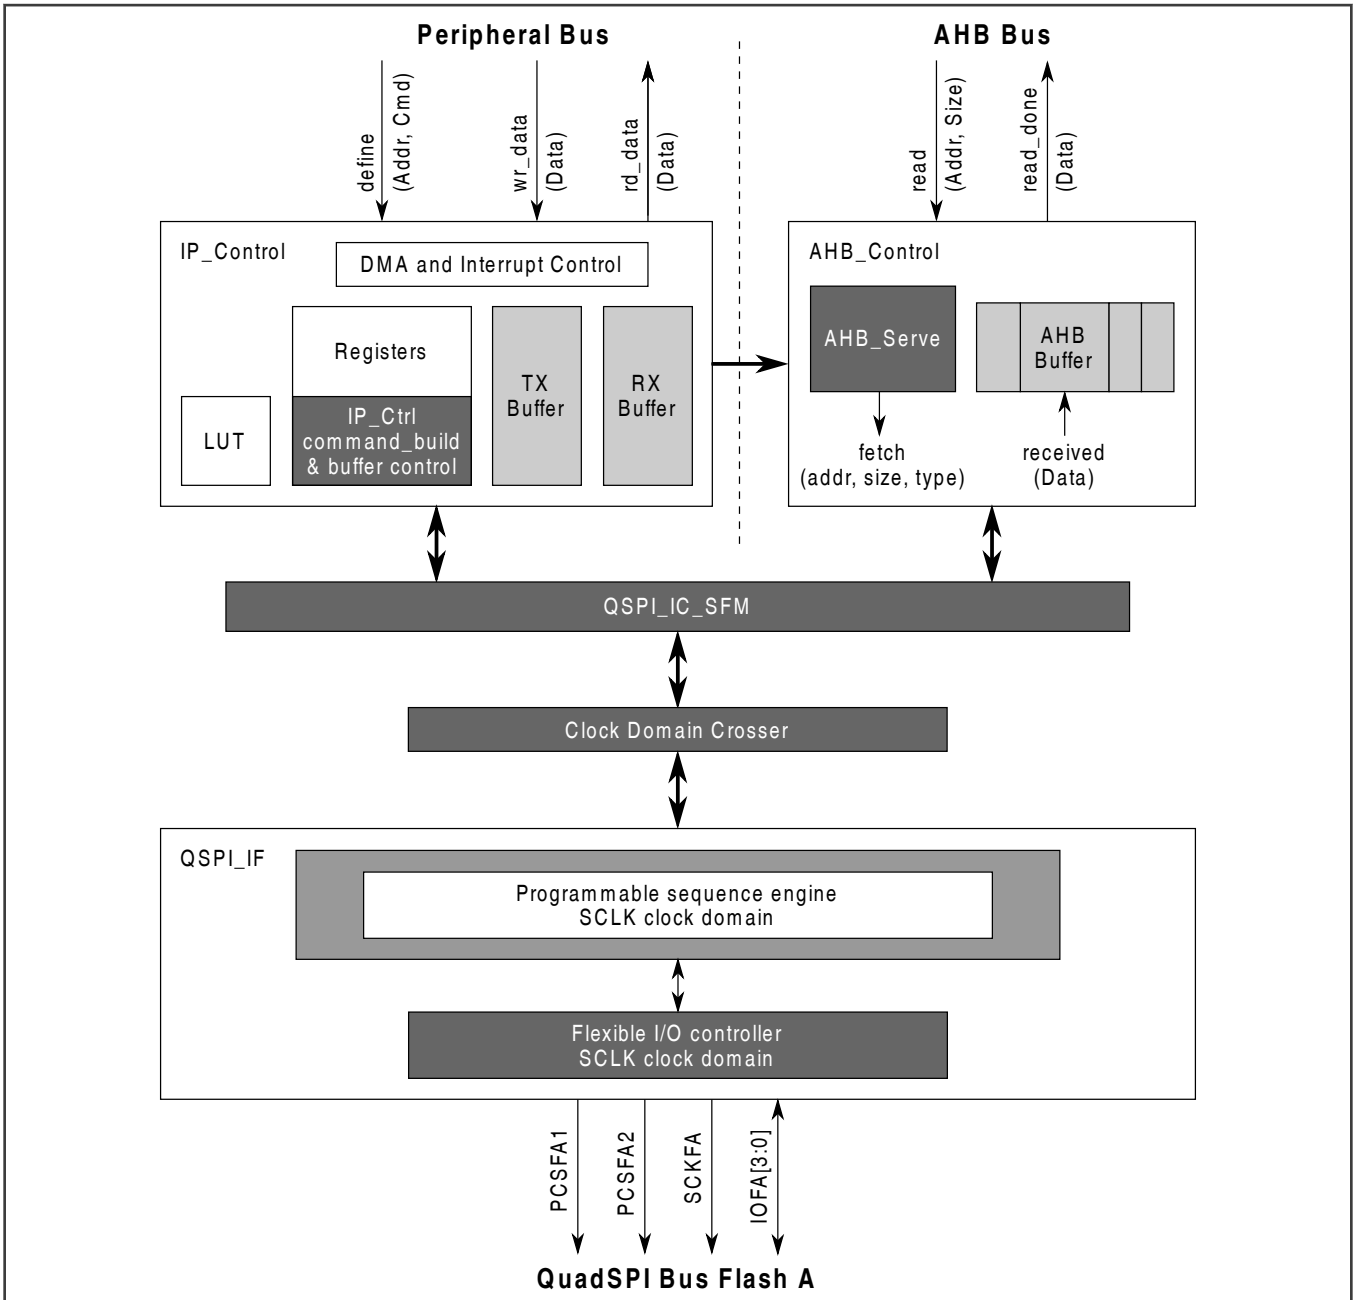

Figure 521. QuadSPI Block Diagram

80.2.5 QuadSPI modes of operation

QuadSPI supports the following modes of operation:

- Normal mode: You can use this mode for write or read accesses to an external serial flash memory device. See Normal mode for details.
  - Serial flash memory write: You can program data into the flash memory through the IP interface only. See Flash memory programming for details.
  - Serial flash memory read: Read the contents of the serial flash memory device. Two separate read channels are available through the RX buffer and AHB buffer. See Flash memory read for details.

- Module Disable mode: You can use this mode for disabling serial flash memory clock and AHB command. The clock to the non-memory mapped logic in QuadSPI can be stopped in the Module Disable mode. The module enters the mode by setting MCR[MDIS].

80.3 External signal description

This section provides the external signal information for the QuadSPI module.

The following table lists the external signals belonging to the module in conjunction with the different modes of operation.

Table 773. Signal properties

Signal name	Function	Direction	Description
PCSFA1	Peripheral Chip Select Flash Memory A1	O	This signal is the chip select for the serial flash memory device A1 that represents the first of the two flash memory devices that share IOFA.
PCSFA2	Peripheral Chip Select Flash Memory A2	O	This signal is the chip select for the serial flash memory device A2 that represents the second of the two flash memory devices that share IOFA.
SCKFA	Serial Clock Flash Memory A	O	This signal is the serial clock output to the serial flash memory device A.
IOFA[3:0]	Serial I/O Flash memory A	I/O	These signals are the data I/O lines to/from the serial flash memory device A. See Driving external signals for details about the signal drive and timing behavior. Note that the signal pins of the serial flash memory device may change their function according to the SFM Command executed, leaving them as control inputs when single and dual instructions are executed. The module supports driving these inputs to dedicated values. In single I/O mode, QuadSPI drives data on IOFA[0] and expects data on IOFA[1].

NOTE

Please refer to chip specific information to check the configuration of QuadSPI block.

80.3.1 Driving external signals

Single/dual/quad instructions

Depending on the serial flash memory device connected to the QuadSPI module, there are instructions using a different number of data lines:

- Single pad: Single line I/O with one data out and one data in line to/from the serial flash memory device
- Dual pad: Dual line I/O with two bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPI module
- Quad pad: Quad line I/O with four bidirectional I/O lines, driven alternatively by the serial flash memory device or the QuadSPImodule

The different phases of the serial flash memory access scheme are shown in the following figure.

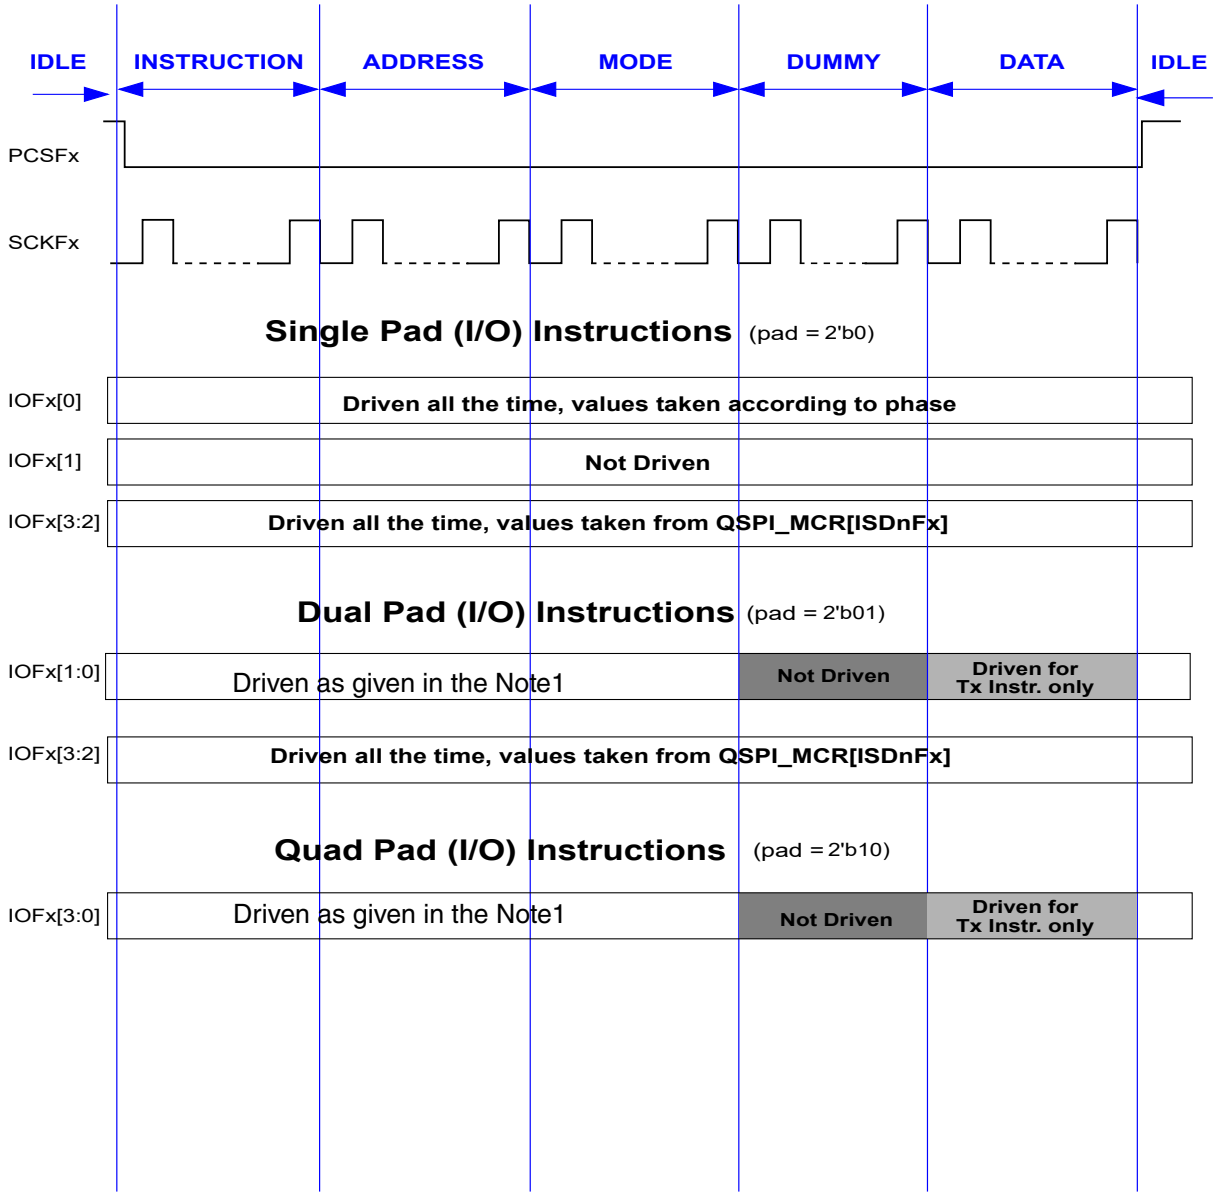

Figure 522. Serial flash memory access scheme

Note1:The IOs are driven from QuadSPI as per the number of pads configured for ongoing phase.

Note:The lines status will change based on command mode in case of instruction, address and mode phases. It can be either 1,2 or 4 lines

Following are the different phases and the I/O driving characteristics of the QuadSPI module:

- Idle: Serial flash memory device not selected – no interaction with the serial flash memory device and the IOFx signals are driven.
- Instruction: Serial flash memory device selected – the instruction is sent to the serial device and all the IOFx signals are driven.
- Address: Serial flash memory address is sent to the device – all the IOFx signals are driven and this phase is not applicable for all SFM commands.
- Mode: Mode bytes are sent to the serial flash memory device – all the IOFx signals are driven and this phase is not applicable for all SFM commands.

- Dummy: Dummy clocks are provided to the serial flash memory device. See Figure 522 for the IOFx signals driven. The actual data lines required for the SFM command executed are not driven for data read commands.

NOTE

— This phase is not applicable for all the SFM commands.

— All read commands in Dual pad, Quad pad modes must use a Dummy phase immediately before the Data phase. The Dummy phase pad configuration in the LUT must use the same number of pads as the subsequent Data phase. Note that this restriction is not applicable to Single-pad mode.

- Data: Serial flash memory data are sent to or received from the serial flash memory device. See the preceding figure for the IOFx signals driven. The actual data lines required for the SFM command executed are not driven for data read commands.

NOTE

This phase is not applicable for all the SFM commands.

The PCSFx and SCKFx signals are driven permanently throughout all the phases. In the individual flash memory mode, this applies to the selected flash memory device.

Access to a single, individual serial flash memory device

See Serial flash memory access schemes for details.

Read access to two serial flash memory devices attached to the QuadSPI module in parallel. See Serial flash memory access schemes for details.

80.4 Functional description

This section provides a functional description of the QuadSPI module.

80.4.1 Serial flash memory access schemes

In the individual flash memory mode, all supported commands are available.

80.4.2 Normal mode

This mode allows communication with an external serial flash memory device. Compared to the standard SPI protocol, this communication method uses up to four bidirectional data lines operating at high-data rates. The communication to the external serial flash memory device consists of an instruction code and optional address, mode, dummy, and data transfers. The flexible programmable core engine described below is immune to a wide variety of command or protocol differences in the serial flash memory devices provided by various flash memory vendors.

80.4.2.1 Programmable sequence engine

The core of the QuadSPI module is a programmable sequence engine that works on "instruction-operand" pairs. The core controller executes each programmed instruction sequentially. The complete list of instructions and the corresponding operands are provided in the following table.

Table 774. Instruction set

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
CMD	1d	N={0,1,2}d 0d - One pad 1d - Two pads 2d - Four pads	8-bit command value	Provides the serial flash memory with the SFM command operand (Encoded) on the number of pads specified in STR mode.

Table continues on the next page...

Table 774. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
ADDR	2d		Number of address bits to be sent (for example, 24d => 24 address bits required)	Provide the serial flash memory with address cycles according to the operand on the number of pads specified The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions, if the value of SFACR[CAS] is set to 0. Otherwise, the actual address takes CAS into consideration.
DUMMY	3d		Number of dummy clock cycles (should be <= 64 and > 2 cycles)	Provide the serial flash memory with dummy cycles according the operand The PAD information defines the number of pads in input mode. For example, one pad implies that pad 1 is not driven, rest all are driven. **NOTE** If DLL is enabled and N dummy cycles are needed, you must program two back-to-back DUMMY instructions: DUMMY: N-2 followed by DUMMY:2.
MODE	4d		8-bit mode value	Provide the serial flash memory with 8-bit operand on the number of pads specified
MODE2	5d	N={0,1}d	2-bit mode value	Provide the serial flash memory with 2-bit operand on the number of pads[1] specified
MODE4	6d	N={0,1,2}d	4-bit mode value	Provide the serial flash memory with 4-bit operand on the number of pads[2] specified
READ	7d	N={0,1,2}d 0d - One pad 1d - Two pads 2d - Four pads	Read data size in bytes (for AHB transactions, your application should ensure that data size is a multiple of 8 bytes)	Read data from flash memory on the number of pads specified The data size can be overwritten by writing to the ADATSZ field of the BUFxCR registers for AHB-initiated transactions and to the IDATSZ field of the IP Configuration Register (IPCR) for IPS-initiated transactions.
WRITE	8		Write data size in bytes	Write data on the number of pads specified The data size can be overwritten by writing to the IDATSZ field of IP Configuration Register (IPCR).
JMP_ON_CS[3]	9d	NA	Instruction number	Every time the CS is deasserted, jump to the instruction pointed to by the operand. This instruction allows the programmer

Table continues on the next page...

Table 774. Instruction set (continued)

Instruction	Instruction encoding	Pins	Operand	Action on serial flash memories
				to specify the behavior of the controller when a new read transaction is initiated following a CS deassertion. **NOTE** This instruction is not supported if DLL is enabled.
CMD_DDR	17d	N={0,1,2}d 0d - One pad 1d - Two pads 2d - Four pads	8-bit command value	Provides the serial flash memory with the SFM command operand (Encoded) on the number of pads specified in DTR mode.
CADDR	18d		Number of column address bits to be sent (8d means 8 bits of column address is to be sent)	Provide the serial flash memory with column address cycles according to the operand on the number of pads specified. The actual address to be provided to flash memory depends on the value of SFACR[CAS]. For example, if the value of SFACR[CAS] is 3, then the address to flash memory will be [2:0] of incoming address in case of AHB and the value of SFAR in case of IP. This is appended with 0 if SFACR[CAS] is less than number of pads for a flash memory.
CADDR_DDR	19d		Number of column address bits to be sent(8d means 8 bits of column address is to be sent)	Provide the serial flash memory with column address cycles according to the operand on the number of pads specified at each clock edge of the serial flash memory. The actual address to be provided to flash memory depends on the value of SFACR[CAS]. For example, if CAS is 3, then the address to flash memory will be [2:0] of incoming address in case of AHB and the value of SFAR in case of IP. This is appended with 0 if CAS is less than the number of pads for a flash memory.
STOP[3]	0d	NA	NA	Stop execution; deassert CS

1. For a one-pad instruction, MODE2 takes two serial flash memory clock cycles on the flash memory interface.
2. For a one-pad instruction, MODE4 takes four serial flash memory clock cycles on the flash memory interface. For a four-pad instruction, MODE4 takes one serial flash memory clock cycle on the flash memory interface.
3. Sequence ending with this instruction must have all remaining bits as 0s after it.

The programmable sequence engine allows you to configure the QuadSPI module according to the serial flash memory connected on board. This flexible structure is compatible with new command or protocol changes from different vendors.

80.4.2.2 Flexible read xAHB buffers

To reduce the latency of the reads for AHB masters, the data read from serial flash memory is buffered in flexible AHB buffers. There are four such flexible buffers. The size of each of these buffers is configurable with the minimum size being 0 bytes and maximum size being the size of the complete buffer instantiated (1024 bytes). The size of buffer 0 ranges from 0 to BUF0IND. The size of buffer 1 ranges from BUF0IND to BUF1IND, buffer2 from BUF1IND to BUF2IND and, buffer 3 ranges from BUF2IND to the size of the complete buffer (1024 bytes).

Each flexible AHB buffer is associated with the following:

- An AHB master: Optionally, buffer3 may be configured as an "all master" buffer by writing 1 to BUF3CR[ALLMST]. When buffer3 is configured in such a way, any access from a master not associated with any other buffer is routed to buffer3.

- A datasize field representing the amount of data to be fetched from the flash memory on every missed access.

The master ID of every incoming request is checked and the data is returned or fetched into the corresponding associated buffer. See the chip-specific QuadSPI information for details about master IDs and their corresponding components. Every missed access to the buffer causes the controller to clear the buffer and fetch the BUFxCR[ADATSZ] amount of data from the serial flash memory. As such, you need not configure the buffer size to be greater than ADATSZ because the locations greater than ADATSZ are never used. For any AHB access, the sequence pointed to by BFGENCR[SEQID] is used for the initiated flash memory transaction. The data is returned to the master as soon as the requested amount is read from the serial flash memory. The controller; however, continues to prefetch the rest of the data in anticipation of a next consecutive request. See Figure 523 that shows flexible AHB buffers.

BFGENCR[SEQID] points to an index of the LUT. See LUT for details.

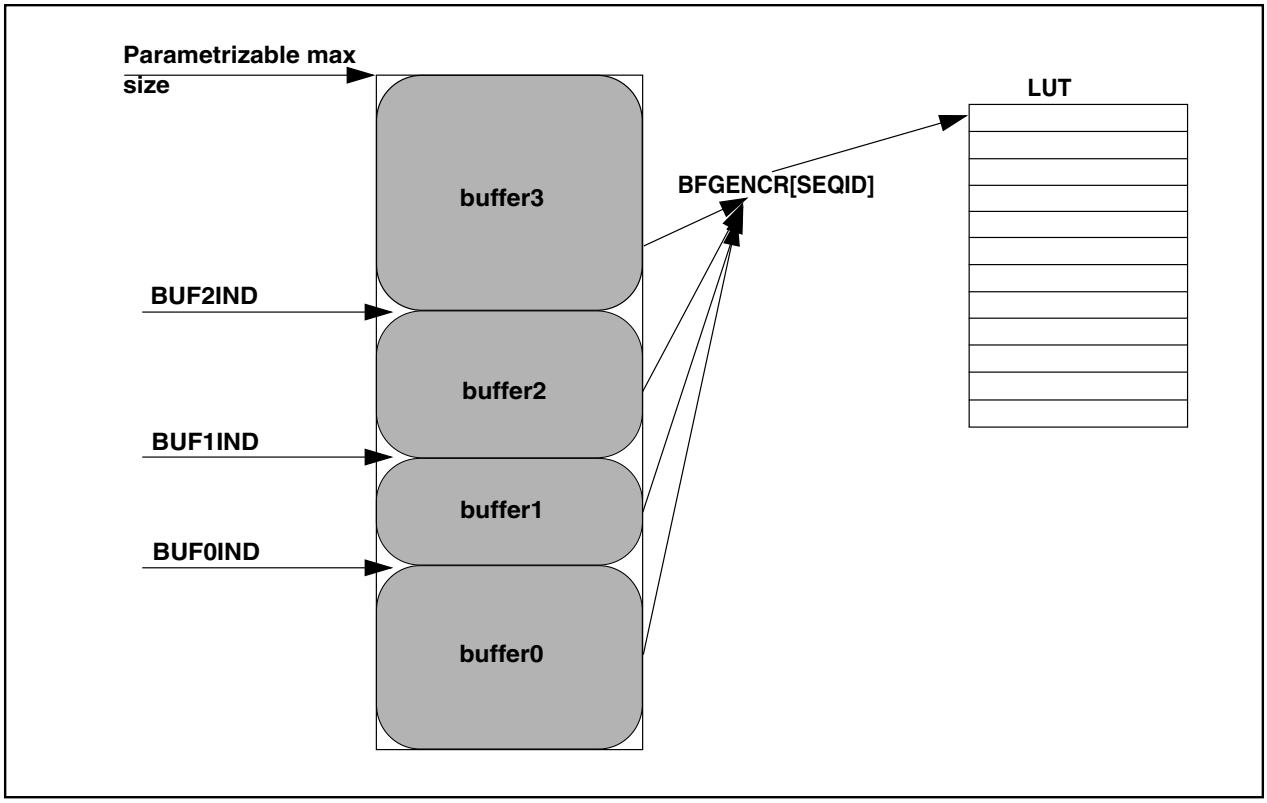

Figure 523. Flexible read AHB buffers

80.4.2.3 Abort mechanism during AHB read

Any ongoing read transaction is aborted if a request from the same master arrives for a location other than the location at which the transaction is going on. The abort can happen at any point of time.

80.4.2.4 HBURST support with AHB read

QuadSPI controller supports HBURST and HSIZE on the AHB read interface. HBURST indicates if the transfer forms part of a burst. Four, eight, and sixteen beat bursts are supported and the bursts might either be incrementing or wrapping. HSIZE indicates the size of the transfer, and supports 8-, 16-, 32-, and 64-bit data sizes. In case of WRAP accesses, QuadSPI generates aligned accesses to serial flash memory if there is no buffer hit for any incoming, non-sequential AHB read access. In case there is a buffer hit, the incoming address in the haddr line is latched as it is. If the total burst size is more than the data prefetch size, an error response is generated and the value of FR[AIBSEF] is configured as 1. The data prefetch size can be defined by BUFxCR[ADATSZ] or data size mentioned in the sequence pointed to by the SEQID field when ADATSZ is programmed as 0. In

case of wrap burst, data prefetch size must be greater than or equal to the wrap burst size + 32 bytes. A few examples are shown in the figure below:

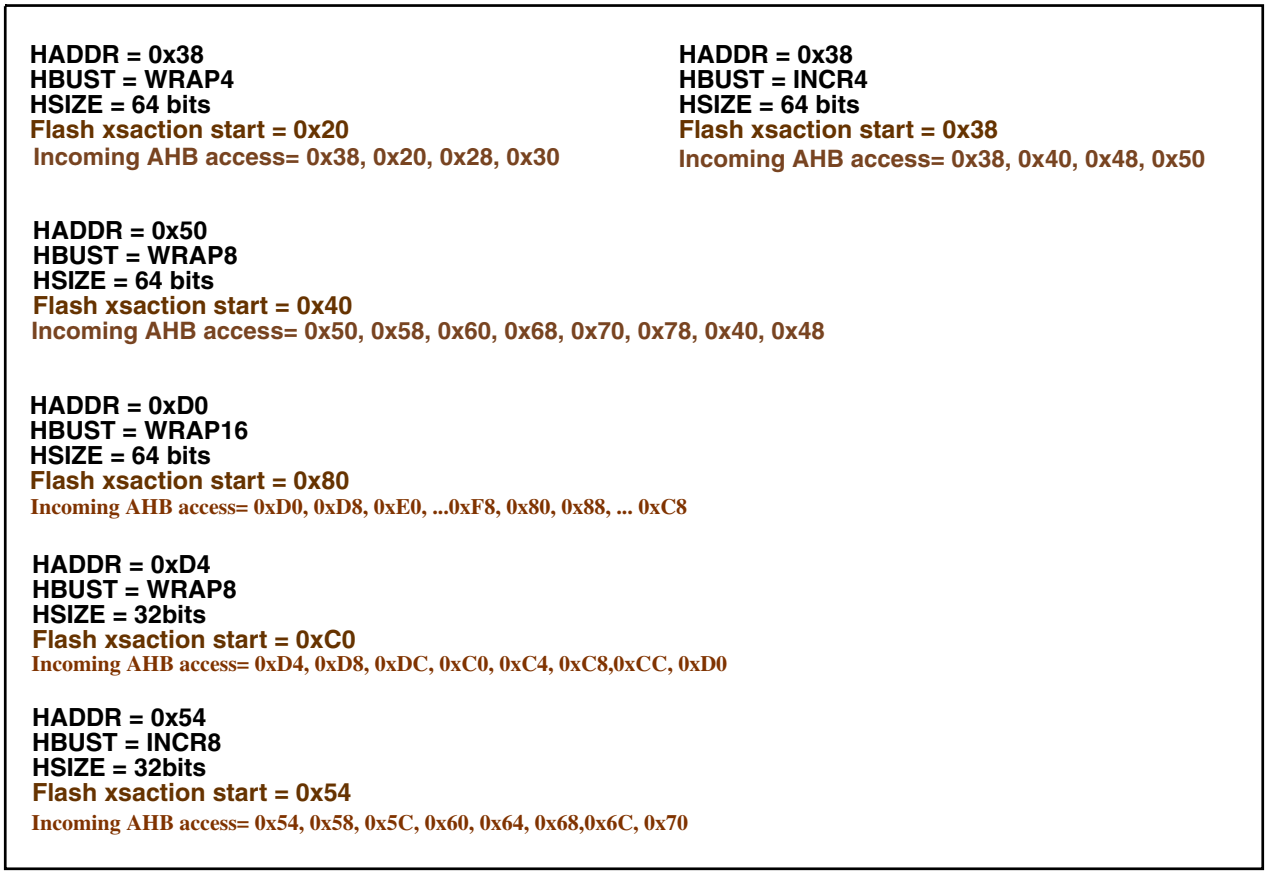

Figure 524. QuadSPI HBURST support

NOTE

The software must take care that the prefetch size should never be set less than the minimum data needed by any external interface to start processing.

NOTE

Whenever a core accesses QuadSPI memory with cache enabled, the prefetch size must be configured as equal or more than the cache line size; otherwise, FR[AIBSEF] error appears.

80.4.2.5 LUT

The LUT consists of a number of pre-programmed sequences. Each sequence is basically a sequence of instruction-operand pairs, which when executed sequentially, generate a valid serial flash memory transaction. Each sequence can have a maximum of 10 instruction-operand pairs. The LUT can hold a maximum of 16 sequences. The figure below shows the basic structure of the sequence in the LUT.

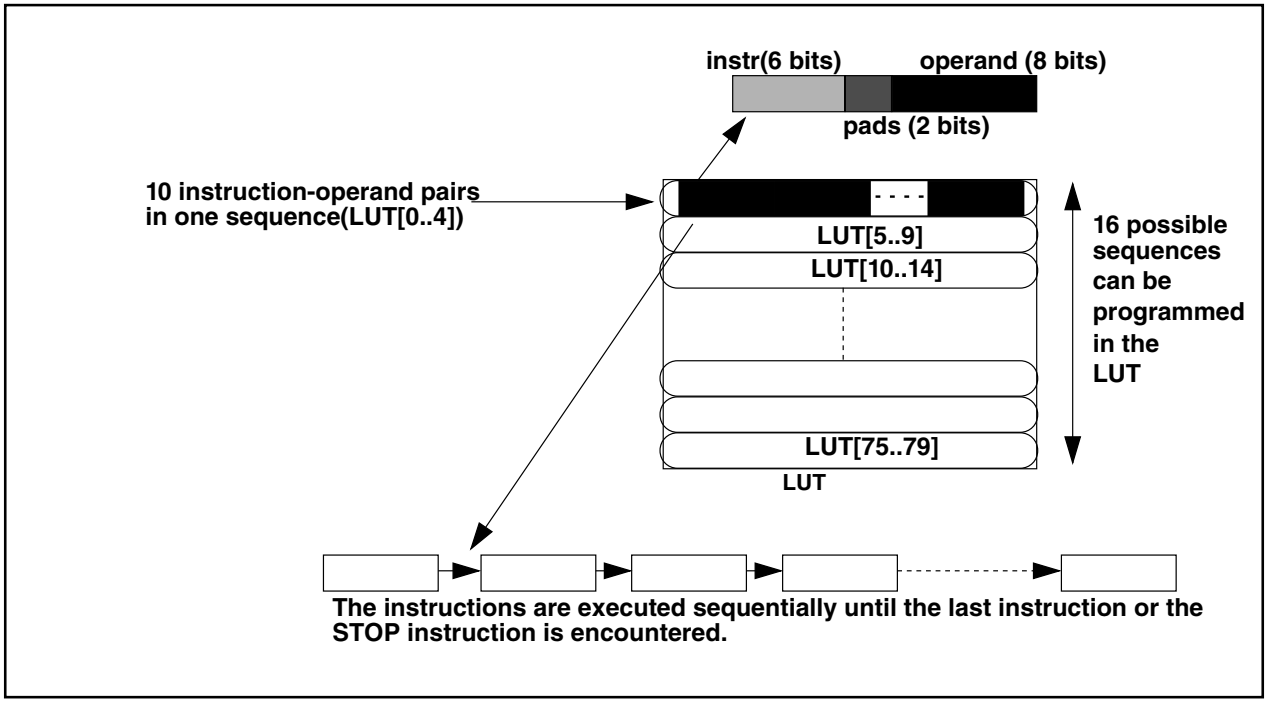

Figure 525. LUT and sequence structure

At reset, the index 0 of the LUT[0..4] is programmed with a basic read sequence as described in Reset sequence. After reset, the complete LUT may be reprogrammed according to the chip connected on board. To protect its contents, during a code runover, the LUT might be locked, after which a write to the LUT will not be successful until it has been unlocked again. The key for locking or unlocking the LUT is 5AF05AF0h, and the associated processes are as follows:

Locking the LUT

1. Write the key 5AF05AF0h into the LUT Key Register (LUTKEY).
2. Write 0b01 to the LUT Lock Configuration Register (LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued). A successful write to this register locks the LUT.

Unlocking the LUT

1. Write the key 5AF05AF0h into the LUT Key Register (LUTKEY).
2. Write 0b10 to the LUT Lock Configuration Register (LCKCR). Note that this IPS transaction should immediately follow the above IPS transaction (no other IPS transaction can be issued in between). A successful write to this register unlocks the LUT.

The lock status of the LUT can be read from the LCKCR[UNLOCK] and LCKCR[LOCK] fields.

Some example sequences are defined in Example sequences. After reset the instruction sequence 0 is populated with the default read sequence shown in the table below.

Table 775. Reset sequence

Instruction	Pad	Operand	Comment
CMD	0h	3h	Read data byte command on one pad
ADDR	0h	18h	24 address bits to be sent on one pad

Table continues on the next page...

Table 775. Reset sequence (continued)

Instruction	Pad	Operand	Comment
READ	0h	8h	Read 64 bits
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

80.4.2.6 Issuing SFM commands

Each access to the external device follows this sequence:

1. You must pre-populate the LUT with the serial flash memory command sequences that are required for the flash memory device being used.
2. The module executes the instructions in this sequence one by one. The transaction starts and the module configures the value of SR[BUSY].
3. Communication with the external serial flash memory device starts and the transaction executes.
4. After the transaction is complete (all transmit and receive operations with the external serial flash memory device are complete), the module resets SR[BUSY]. In case of an IP command, FR[TFF] is asserted.

For details, see Flash memory programming and Flash memory read.

You can trigger the processing of SFM commands in the QuadSPI module in one of the following ways:

Using IP commands

For IP commands, the required components need to be written into the following registers and in this sequence:

1. Write the serial flash memory address to be used as provided in the Serial Flash Address Register (SFAR). For IP commands not related to specific addresses, the base address of the related flash memory needs to be programmed. For example, for an instruction which does not require an address (that is, write enable instruction), the SFAR should be programmed with the base address of the memory the command is to be sent to.
2. Write the sequence ID and data size details in the IP Configuration Register (IPCR).
3. Note that writing a value to IPCR[SEQID] must be the last step of the sequence. It is possible to combine all the fields of the IPCR into one single write. See IP Configuration Register (IPCR) for details.

Using AHB commands

Any AHB memory-mapped access is routed to one of the buffers depending on the master ID of the request. If the access is a "miss," a new serial flash memory transaction is initiated. The transaction is based on the sequence pointed to by BFGENCR[SEQID] as described in Flexible read xAHB buffers.

An AHB access is considered memory mapped when the access is to the memory-mapped serial flash memories, as described in Memory Mapped Serial Flash Data - Individual Flash mode on Flash memory A.

80.4.2.7 Flash memory programming

In all NOR Flash devices memory sector to be written needs to be erased first. The programming sequence is then initiated in the following way:

1. Program the FRAD and MDAD registers.
2. Program the address related to the command in SFAR (with access attributes programmed in MDAD). If required, write the desired value to SFACR[CAS], otherwise write 0 to it. Also, write 1 to SFACR[WA] if the serial flash memory is a word addressable flash memory, or write 0 in case serial flash memory is byte addressable

3. Program the IPCR register (with access attributes programmed in MDAD). IPCR[SEQID] should point to an index of the LUT that has the flash memory program sequence pre-programmed. Write an appropriate value to IPCR[IDATSZ] to denote the size of the write in bytes.
4. Check FSM Status (FSMSTAT) register to know status of current transaction. Valid[31] bit should be '1' and domain ID [11:8] should match the ID with which SFAR and IPCR were written. Program the TX watermark in TBCT[WMRK] field and wait for STAT[1:0] bits to turn '01'.
5. Check that the TX buffer is empty. If you need to discard the data present in the TX buffer (SR[TXEDA]) field is set, then the TX buffer must be cleared by writing 1 to MCR[CLR_TXF].
6. Provide data for the program command into the circular buffer through the TBDR. Once the TX buffer is written till watermark level and SR[TXWA] flag is de-asserted this IP command will be triggered. FSMSTAT[STAT] will get set to 10.
7. Repeat step 3, depending on the amount of data required, until all of the required data is written to the TBDR. SR[TXFULL] can be used to check if the buffer is ready to receive more data. At any time, TBSR[TRCTR] can be read to check how many words have been written into the TX buffer.
8. Once the transaction completes FSMSTAT[VLD] bit will set to 0, SR[BUSY] is reset and FR[TFF] is asserted. Please refer to section Secure flash programming for more details.

After writing to IPCR[SEQID] , the module starts executing the programmed sequence when QuadSPI SFM is IDLE. The software ensures that the correct sequence is programmed into the LUT in accordance with the flash memory connected to the module. The data is fetched from the TX buffer. It consists of 256 entries of 32-bit sizes and is organized as a circular FIFO, the read pointer for which is incremented after each fetch. When all the data is transmitted, the QuadSPI module returns from the busy state to the idle state. However, this is not true for the external device because the internal programming is still ongoing. You may monitor the relevant status information available from the serial flash memory device and ensure that the programming is done appropriately.

80.4.2.8 Flash memory read

Host access to the data stored in the external serial flash memory device is performed in two steps. First, the data must be read into the internal buffers and in the second step, these internal buffers can be read by the host.

Reading serial flash memory data into the QuadSPImodule internal buffers

A read access to the external serial flash memory device can be triggered in two different ways:

- IP command read: For reading flash memory data into the RX buffer, you must provide the correct sequence ID in IPCR[SEQID]. The sequence ID points to a sequence in the LUT. The software needs to ensure that a correct read sequence is programmed in the LUT in accordance with the serial flash memory device connected on board. You must program the SFAR , SFACR[CAS], and IPCRs. All available read commands supported by the external serial flash memory are possible.

  Optionally, it is possible to clear the RX buffer pointer prior to triggering the IP command by writing a 1 to MCR[CLR_RXF]. This will invalidate the data currently present in the RX buffer and any new read data will overwrite the old one.

  Using these inputs, the complete transaction is built when IPCR[SEQID] is written to and if MDAD checks are passing (based on the access attributes while writing SFAR and IPCR). The transaction related to the read access starts when QuadSPI is IDLE and FSMSTAT[VLD] bit is 1. The data is fetched for the domain ID that is shown in FSMSTAT[11:8] bits when FSMSTAT[STAT] is set to 11 and the requested number of bytes is fetched from the external serial flash memory device into the RX buffer. As the read access is triggered by an IP command, the value of both SR[IP_ACC] and SR[BUSY] is set to 1.. A count of the number of entries currently in the Rx buffer can be obtained from RBSR[RDBFL].

  Communication with the external serial flash memory stops if the specified number of bytes are read (on successful completion of the transaction).

- AHB command read: For reading flash memory data into the AHB buffer, you must:
  - Set up a read access by a master to the address range in the system memory map, which the external serial flash memory devices are mapped to.
  - Write a desired value to SFACR[CAS], if required, or write 0 to the field.
  - Program the buffer registers corresponding to the AHB master initiating the request.

— Provide the correct sequence ID in the BFGENCR. The software ensures that a correct read sequence is programmed in the LUT in accordance with the serial flash memory device connected on board. Flash memory device selection and access mode are determined by the address accessed in the AHB address space associated with the QuadSPI module (see Memory-mapped serial flash memory data—individual flash memory mode on flash memory A

On each AHB read access to the memory mapped area, the valid data in the AHB buffer is checked against the address requested in the actual read. When the AHB read request cannot be served from the content of the AHB buffer, the buffer is flushed and the controller executes the sequence pointed to by the sequence ID. The requested number of buffer entries defined in BUFxCR[ADATSZ] is then fetched from the external serial flash memory device into the internal AHB buffer. As the read access is triggered through the AHB bus, the value of SR[AHB_ACC] is set, driving SR[BUSY] in turn, until the transaction is complete. Communication with the external serial flash memory stops when the specified number of entries is filled.

Data transfer from the QuadSPI module internal buffers

The data read out from the external serial flash memory device by the QuadSPI module is stored in the internal buffers. The means of accessing the data from the buffer differs depending on which buffer the data is loaded to. See Block diagram for details on the two available buffers, the RX buffer and the AHB buffer, in this module. The buffer appears transparent to you and is non-memory mapped. See the "Flexible AHB Buffer" section for details.

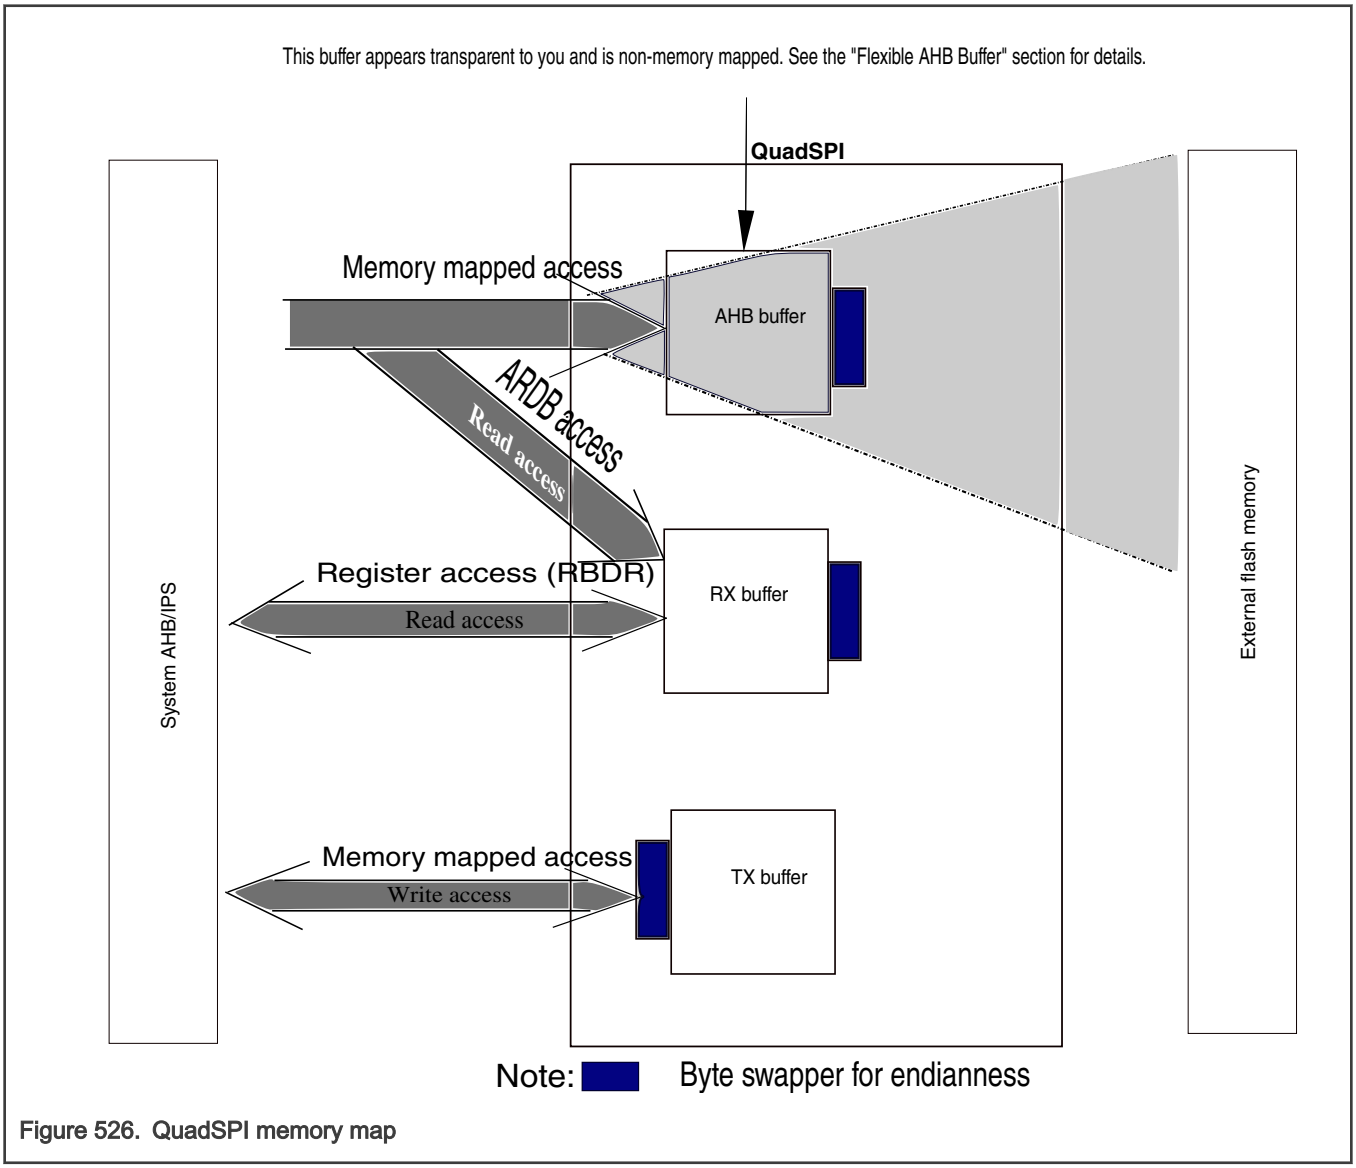

Figure 526. QuadSPI memory map

The RX buffer is implemented as FIFO of depth 32 entries of 4 bytes. Its content is accessible in two different address areas, both referring to identical data and the same physical memory:

- In the IPS address space in the area associated with RX Buffer Data Register (RBDR0 - RBDR31).
- In the AHB address space in the area associated with AHB RX Data Buffer Register (ARDB0 - ARDB31).Two successive entries are accessed with one single 64-bit AHB read operation.

The RX buffer operation can be summarized as follows:

- RBCT[WMRK] determines at which fill level SR[RXWE] is asserted and how many entries are removed from the RX buffer on each buffer POP operation.
- SR[RXWE] indicates that the configured number of data entries is available in the RX buffer and RBSR[RDBFL] indicates how many valid entries are available in total.
- The first entry (RBDR0 or ARDB0) always corresponds to the first valid entry in the RX buffer.

For details, see RX Buffer Data Register (RBDR0 - RBDR31) and AHB RX Data Buffer Register (ARDB0 - ARDB31).

- Flag-based data read of the RX buffer is performed by polling SR[RXWE]. When it is asserted, the valid entries can be read either via the IPS address space (RBDRn) or the AHB address space (ARDBn). A buffer POP operation must be triggered by the application by writing a 1 to FR[RBDF]. This automatically updates the FIFO to point to the next entry as defined by RBCT[WMRK]. For example, if WMRK is set to 3, then the buffer discards 16 bytes of data.
- DMA-controlled data read of the RX buffer is performed by using the DMA module. The application must ensure that the DMA controller of the related chip is programmed appropriately, as described in DMA usage.
- DMA-controlled read out is triggered fully automatically by the assertion of SR[RXWE]. The related buffer POP operation is also handled completely inside the QuadSPI module. As in the case explained here, accessing the RX buffer content either on RBDRn or ARDBn related addresses is equivalent.
- AHB buffer data read via memory-mapped access: This kind of access is performed by reading one of the addresses assigned to the external serial flash memory device(s) within the range specified in Table 804. If this is not the case, a memory-mapped AHB command read is triggered as described above. If the requested data is already available in the AHB buffer, it is provided directly to the host.

When an AHB access is made to the flash memory mapped address, the data is fetched and returned to the AHB interface. The AHB interface is stalled until the data is fetched. As soon as the data from the requested address is read by the QuadSPI module, the AHB read access is served. Therefore, it is possible to run sequential reads from the AHB buffer at arbitrary speed without the need to monitor any information about the availability of the data. Nevertheless, this access scheme stalls the AHB bus for the time required to read the data from the serial flash memory device. If you know that the access is sequential, a better way is to have a prefetch enabled by programming the value of BUFxCR[ADATSZ] so that the data is fetched into the buffer before the next sequential AHB access.

As long as the host restricts its accesses to the data present in the buffer and to the data currently fetched from the serial flash memory, it is possible to run the host read from the AHB buffer simultaneously with the serial flash memory read into the AHB buffer.

80.4.2.9 Byte ordering of serial flash memory read data

The basic scheme is that the first byte read out of the serial flash memory device, which is addressed by SFAR[SFADR], corresponds to RBDR0[31:24] for IP command read. Similarly, to send a single byte it should be positioned in TBDR[0:7]. In contrast to that for AHB command read, the bytes are always positioned according to the byte ordering of the AHB bus.

- Byte ordering in individual flash memory mode

  The following table provides the byte ordering scheme of how the byte oriented data space of the serial flash memory device is mapped into one single 32-bit entry of the RX buffer or the AHB buffer. The table is valid within the following context:

  — Flash memory A in individual flash memory mode

  — All AHB data read commands with 32-bit access size

Table 776. Byte ordering in individual flash memory mode

Serial flash memory byte numbering	3	2	1	0
Buffer entry bit position [31:0] (32-bit data width)	[31:24]	[23:16]	[15:8]	[7:0]

NOTE

For IP commands, the read size can be specified as number of bytes. If this number is not a multiple of four, then the last buffer entry is not completely filled with the missing higher numbered bytes at undefined values.

For AHB commands and reads, starting from an address not aligned to 32-bit boundaries, the requested bytes are given at the appropriate positions according to the AMBA AHB specification.

- Buffer entry ordering for 64-bit read access

  For read access via the AHB interface, a 64-bit access is possible. Each 64-bit access reads two 32-bit entries, simultaneously. The ordering of these 32-bit entries within the 64-bit word is provided in the following table.

Table 777. 64-bit read access buffer entry ordering

AHB read data bit position [63:0]	[63:32]	[31:0]
Buffer entry #	Odd (1, 3, 5, ...)	Even (0, 2, 4, ...)

80.4.2.10 Normal mode interrupt and DMA requests

The QuadSPI module has different flags that can only generate interrupt requests and one flag that can generate an interrupt as well as DMA requests. The following table lists the eight conditions. Note that the flags mentioned in the table are associated with the Flag Register (FR).

Table 778. Interrupt and DMA request conditions

Condition	Flag (FR)	DMA
TX buffer fill	TBFF	-
TX buffer underrun	TBUF	-
Illegal instruction error	ILLINE	-
RX buffer drain	RBDF	X
RX buffer overflow	RBOF	-
AHB buffer overflow	ABOF	-
AHB sequence error	ABSEF	-
AHB illegal transaction error	AITEF	-
AHB illegal burst size error	AIBSEF	-
IP command trigger could not be executed error	IPIEF	-
IP command related transaction finished	TFF	-

Each condition has a corresponding field in Flag Register (FR) and a request enable field in DMA Request Select and Enable Register (RSER). FR[RBDF] has separate enable fields for generating IRQ and DMA requests. Note that not all the fields have an individual IRQ line. See the chip's Interrupt Vector table for details.

- Transmit buffer fill interrupt request

  This indicates that the TX buffer can accept new data. The buffer is asserted if FR[TBFF] is asserted and if the value of the corresponding enable field, RSER[TBFIE], is 1. See TX buffer Operation for details on the assertion of FR[TBFF].

  Apart from IRQ, it is possible to handle the TX buffer fill by using the DMA. If the value of RSER[TBFDE] is 1, a DMA request is triggered when the number of available space in the TX buffer is more than the TBCT[WMRK] valid entries and value of SR[TXWA] is set. The application must configure the environment appropriately (for example, the DMA controller) for the DMA transfer.

  In SFP Enabled configurations, program RSER[TBFDE] bit to 1 only when arbitration is won and TBDR access is unlocked after checking STATE field of FSMSTAT register. After TBDR programming is completed by DMA, reset this bit otherwise, QuadSPI SFM state will remain busy and no further IPS accesses can be served by that Target queue.

- Receive buffer drain interrupt or DMA request

  This is derived from FR[RBDF], indicating that the RX buffer of the QuadSPI module has data available from the serial flash memory device to be read by the host. It remains set as long as RBSR[RXWE] is configured. Also, RSER[RBDIE] enables the related IRQ.

  Apart from the IRQ, it is possible to handle the RX buffer drain by using the DMA. If the value of RSER[RBDDE] is 1, a DMA request is triggered when the RX buffer contains more than RBCT[WMRK] valid entries. The application must set the environment appropriately (for example, the DMA controller) for the DMA transfers.

- Buffer overflow/underrun interrupt request

  This is a combination of the following fields (all located in the Flag Register (FR) with the related enable bits in the DMA Request Select and Enable Register (RSER)):

  — TBUF - TX buffer underrun, enabled by TBUIE

  — RBOF - RX buffer overflow, enabled by RBOIE

  — ABOF - AHB buffer overflow, enabled by ABOIE

  — The transmit buffer underrun indicates that an underrun condition in the TX buffer has occurred. It is generated when a write instruction is triggered whilst the TX buffer is empty and the value of RSER[TBUIE] is 1.

  — The receive buffer overflow indicates that an overflow condition in the RX buffer has occurred. It is generated when the RX buffer is full, an additional read transfer attempts to write into the RX buffer, and the value of RSER[RBOIE] is 1.

  — The AHB buffer overflow indicates that an overflow condition in the AHB buffer has occurred. It is generated when the AHB buffer is full, an additional read transfer attempts to write into the AHB buffer and the value of RSER[ABOIE] is 1.

  — The data from the transfers that generated the individual overflow conditions is ignored.

- Serial flash memory command error interrupt request
- Transaction finished interrupt request

  The IP command transaction finished IRQ indicates the completion of the current IP command. It is triggered by FR[TFF] and is masked by RSER[TFIE].

80.4.2.11 TX buffer operation

The TX buffer provides the data used for page programming. For proper operation, it is required to provide at least one entry in the TX buffer prior to starting the execution of the page programming command. The application must ensure that the required number of data bytes is written into the TX buffer fast enough as long as the command is executed without a TX buffer overflow or underrun.

The QuadSPI module sets the FR[TBFF] field as long as the TX buffer is not full and can accept more data. At the end of write through TX buffer, you must clear FR[TBFF] to avoid unnecessary last TX buffer fill interrupt. However, there would always be a pending request asserted from QuadSPI controller at the end of any DMA transfer. When external DMA finishes transfer iteration, this request from QuadSPI is kept asserted for the next iteration loop.

NOTE

Even if the generation of DMA requests for filling the TX buffer is disabled by using RSER[TBFDE], the TX buffer still accepts a DMA transfer because of the last asserted pending request.

Disabling of DMA transfer should be controlled by an external DMA master.

When the QuadSPI module tries to pull data out of an empty TX buffer, FR[TBUB] signals the TX buffer underrun. The TX buffer underrun flag is also asserted when the TX buffer contains less than 32-bits of data and the QuadSPI module tries to pull out data from it. The current IP command leading to the underrun condition is continued until the specified number of bytes is sent to the serial flash memory device. Also, the data that is transferred is in the Fs format. This means, after the underrun flag is set under this condition, it returns Fs until the required number of bytes are not sent. This has been done to ensure that the software does not erase the whole sector after underrun and just reprogramming from failure point serves the purpose. When this sequence command is complete, FR[TBFF] is asserted, indicating that the TX buffer is ready to be written again.

The TX buffer overflow is not signaled explicitly, but TBSR[TRBFL] can monitor the TX buffer fill level.

For more information, see TX Buffer Status Register (TBSR) and Flag Register (FR).

80.4.2.12 Address scheme

Earlier, serial flash memories supported only a 24-bit address space, restricting the maximum memory size of the serial flash memory to 16 MB. The new memory specification supports two types of 32-bit addressing mode in addition to the legacy 24-bit address mode. It also supports segregation of address programmed into Row address and Column address of the flash memory, as per the requirement.

Extended address mode

In this mode, the legacy 24-bit commands are converted to accept 32-bit address commands. The flash memory needs to be configured for the 32-bit address mode. Also, while programming the LUT sequence in QuadSPI for 32-bit mode, the ADDR commands should be programmed with 32d as the operand value with SFACR[CAS] programmed to 0. If a flash memory needs some bits of the address as its column address, then it must be considered that a total of 12 bits are required by the flash memory; however, the number of bits should not exceed 32 because the maximum address supported by QuadSPI is 32 bits.. Each of the memory vendors have a different way of enabling this mode (see the memory specification from memory vendors). For example, the command B7h sent to the Macronix flash memory enables it for the 32-bit address mode.

Extended address register

In this mode, the upper 8 bits of the 32-bit register are provided by the Extended address register in the memory, which provides a specific register that is updated according to the address to be accessed. This effectively converts the legacy 24-bit address command into 32-bit address commands. The memories greater in size than 16 MB consist of banks of 16 MB each. The 8 bits occupied in the extended address register effectively enable a bank. For example, in Spansion memory, when the extended address register is updated with a value of 1h, with the help of the 17h command, it opens Bank1 of the memory. The consequent 24-bit address commands lead to Bank1. The extended address register needs to be updated with the respective value for access to other banks. This effectively converts the legacy 24-bit address command into 32-bit address commands.

Separation of address into rows and columns

This mode has been introduced for flash memories that need addresses segregated into rows and columns. The value in SFACR[CAS] defines the width of the column address required by a flash memory. The actual address to be provided is derived from the incoming address in case of AHB-initiated transactions and the value of SFAR in case of IPS-initiated transactions, if the value of SFACR[CAS] is 0. Otherwise, the actual address takes CAS into consideration. If the value of SFACR[CAS] is 3, then bits 26-3 of the programmed address are sent to the flash memory as its page address. This is in case the flash memory is operating in a 24-bit mode and bits 2-0 are sent as its column address. If a flash memory requirement for column address is less than the number of pads in which address has to be sent, then QuadSPI appends the remaining bits by 0. You must program the operand value in CADDR and CADDR_DDR command accordingly. It must be ensured that the total number of address bits requested by flash memory as its page and column address must not be more than 32 bits.

Word addressable mode for flash memory

This mode has been introduced for flash memories, which have a word-addressable memory. This means, each address of the flash memory contains one word (two bytes) of data. The value of SFACR [WA] is configured to 1 to enter this mode. QuadSPI

internally divides the incoming address in the AHB bus or the address in the SFAR to map it to a valid flash memory location. For example, if the incoming address is 2004h, the controller re-maps this address to access the flash memory location 1002h. If not in this mode, the incoming address 2004h is mapped to flash memory location 2004h.

80.4.3 Module Disable mode

Module Disable mode is a block-specific mode that the QuadSPI can enter to disable serial flash memory clock and AHB command. This mode can be entered by:

- The host software: by writing a '1' to MCR[MDIS]

Below are the condition that must be fulfilled to enter the Module Disable mode:

- SR[BUSY] = 0
- SR[AHBTRN] = 0
- RBSR[RDBFL] = 0
- SR[RXDMA] = 0
- SR[TXDMA] = 0
- None of the flags in FR are enabled as interrupts is set

The conditions mentioned above ensures the following:

- There is no SFM command currently being executed.
- All the data read into the RX buffer from the serial flash memory have been fetched by the application.
- There is no current AHB access.
- There is no active DMA request.
- There is no enabled interrupt that is pending.

Certain read or write operations have a different effect when the QuadSPI is in the Module Disable mode. In the Module Disable mode, not all of the status and flag bits of the QuadSPI module are updated, and writing to them has no effect. Interrupt and DMA request signals cannot be cleared while in the Module Disable mode.

NOTE

It is illegal to issue a new SFM command starting two clock cycles prior to raising the request of entering the Module Disable mode until the QuadSPI stays in this mode.

80.4.4 Leaving Module Disable mode

In the Module Disable mode, the serial flash memory clock and AHB command to the QuadSPI module are switched off.

After the QuadSPI has left this mode and has returned to Normal mode, the execution of the first SFM command is deferred until the clock to drive that part of the module related to the serial flash memory device is available. Depending upon the point in time when the first SFM command is triggered, the actual execution of the command starts with a delay, respective with the re-enabling of the flash memory clock signal.

80.5 Initialization/application information

This section provides the initialization and application information of the QuadSPI module.

80.5.1 Power up and reset

The serial flash memory devices connected to the QuadSPI module might require special voltage characteristics of their inputs during power up or reset. The application must ensure this.

CAUTION

Erase or program commands should be completed before issuing a reset or power cycle to avoid corrupted flash pages. The application shall ensure there is a backup of critical data stored at a different location to enable recovery from corrupted flash pages.

Example: Flash reset sequence

Use the following sequence to reset flash A:

1. Make sure that the flash supports a reset for the condition CS#=high and IOF[3]=low.
2. Set MCR[SWRSTSD] and MCR[SWRSTHD] fields and then clear them.
3. Set MCR[MDIS] field.
4. Reset MCR[ISD3FA] field for flash A.
5. Clear MCR[MDIS] field.
6. Set MCR[MDIS] field.
7. Set MCR[ISD3FA] field for flash A.
8. Clear MCR[MDIS] field.

80.5.2 Available status/flag information

This section provides an overview of the different flags and statuses available, and their interdependencies for different use cases. The SR and FR are the related registers.

80.5.2.1 IP commands

See IP Configuration Register (IPCR) for additional details not explicitly covered in this paragraph.

- IP commands—normal operation

  Writing to IPCR[SEQID] triggers the execution of a new IP command. Given that this is a legal command, SR[IPACC] and SR[BUSY] are asserted simultaneously, immediately after the execution starts.

  After the instruction on the serial flash memory device is complete, these field deassert and FR[TFF] is configured.

- IP commands—error situations

  See Overview_of_Error_Flags for details.

80.5.2.2 AHB commands

See the "Reading serial flash memory data into the QuadSPI module internal buffers" topic in theFlash Memory Read section for details.

- AHB commands—normal operation

  Memory-mapped read access to a serial flash memory address not contained in the AHB buffer triggers the execution of an AHB command. Given that this is a legal command, SR[AHB_ACC] and SR[BUSY] are asserted simultaneously, immediately after the execution starts. After the instruction on the serial flash memory device is complete, these fields are deasserted.

- IP commands—error situations

  See Overview of FR error flags for details.

80.5.2.3 SFM commands

An SFM command consists of an instruction code and all other parameters (for example, size or mode bytes) needed for that specific instruction code. Triggering a command either initiates a transaction on the external serial flash memory or results in an error. See Table 779 for details on errors.

80.5.2.4 Overview of error flags

The following table provides an overview of the different error flags in the FR and additional error-related details.

Table 779. Overview of FR error flags

Error category	Error flag in FR	Command execution on serial flash memory device TFF behavior (in case of IP commands only)	Description
AHB error flag	ABOF	Flash memory transaction continues until it finishes	Set when the module tries to push data into the AHB buffer that exceeds the size of the AHB buffer. Occurs only because of the wrong programming of BUFxCR[ADATSZ].
AHB error flag	AIBSEF	Flash memory transaction is aborted	Total burst size of the AHB transaction is greater than prefetch data size.
AHB error flag	AITEF	Flash memory transaction is aborted	No response is generated from QuadSPI to AHB bus in case of illegal transaction. Also, the watchdog timer expires.
Miscellaneous error flag	ILLINE	Flash memory transaction aborted	Illegal instruction error flag - set when an illegal instruction is encountered by the controller in any of the sequences.
Command arbitration error	IPIEF	TFF not asserted in conjunction with that command	IP command error - caused when IP access is currently in progress (IP_ACC is set) and during: • Write attempt to RBCT register
Buffer-related error	RBOF	TFF is asserted on completion	• RX buffer overrun
Buffer-related error	TBUF	TFF is asserted on completion	• TX buffer underrun

Note that only the buffer-related errors are associated with a transaction on the external serial flash memory. All the other errors do not trigger an actual transaction.

80.5.2.5 IP bus and AHB access command collisions

There are following flags related to this topic: FR[IPIEF]. See the "Reading serial flash memory data into the QuadSPI module internal buffers" topic of the Flash Memory read section for a description of the flags.

80.5.3 Flash memory device selection

Regardless of the SFM command (IP or AHB), the access mode is selected by specifying the 32-bit address value for the following SFM command.

For IP commands, the access mode is selected with the address programmed into the SFAR register. See Serial Flash Address Register (SFAR) for details.

For AHB commands, the access mode is determined by the memory-mapped address. See AMBA Bus Register Memory Map for details.

80.5.4 DMA usage

For a complete description of the DMA module, see the related DMA Controller chapter. This section only provides QuadSPI-specific DMA usage details.

80.5.4.1 DMA usage in normal mode

80.5.4.1.1 Bandwidth considerations

Careful consideration of the throughput rate of the entire chain (serial flash memory -> AHB bus / IP bus -> DMA controller) involved in the read/write data process is essential for a proper operation. Such analysis must take into account not only the data rate provided by the serial flash memory but also the data rate of the AHB bus and the performance of the DMA controller in reading/writing data from/to the RX/TX buffer.

Two figures must match for a proper operation, which means that the data rate provided by the serial flash memory device must not exceed the average RX buffer readout data rate. Otherwise, the longer this state persists, it results into an RX buffer overflow. Similarly, the data consumed by the serial flash memory device must not exceed the average TX buffer fill rate. If this persists, it leads to an underrun.

AHB bus side (data read)

The total number of bus cycles for each DMA minor loop completion is added from the following components:

The following table provides certain examples for typical use cases:

Case 1: DMA needs to read 4 bytes from SRAM and provide to QuadSPI. It costs total four bus clock cycles. Then, DMA handshake adds additional six bus clock cycles, resulting in a total of [6 + 4 * (32/4) = 38] bus clock cycles.

Table 780. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 60 MHz bus clock frequency
3	16	6+(16/4)*4 = 22	~366ns
7	32	6+(32/4)*4 = 38	~633ns
11	48	6+(48/4)*4 = 54	~900ns
15	64	6+(64/4)*4 = 70	~1166ns

Case 2: DMA needs to read 32 bytes from SRAM and provide to QuadSPI. DMA handshake takes an additional six bus cycles, with 32 bytes DMA read from SRAM costs (8 + 3) core clock cycles. DMA writes 32 bytes to QuadSPI, takes 2 * (32/4) = 16 bus cycles with one additional CPU access to QuadSPI, costing two bus clock cycles. This results in a total 6 + (8+3)/2 + 2 * (32/4) +2 = 30 bus clock cycles.

Table 781. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop >	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 80 MHz bus clock frequency
3	16	6 + (4+3) /2 + (16/4)*2 + 2 = 20	~333ns
7	32	6 + (8+3) /2 + (32/4)*2 + 2 = 30	~500ns
11	48	6 + (4+3)/2*3 + (48/4)*2 + 2 = 44	~733ns
15	64	6 + (8+3) + (64/4)*2 + 2 = 51	~810ns

NOTE

This table figure represents an ideal scenario; actual performance depends on how the chip integrates DMA and QuadSPI modules.

Serial flash memory device side (data read)

The number of serial flash memory cycles can be determined in the following way:

- Number of serial flash memory clock cycles is required to read 4 bytes, corresponding to one RX buffer entry (setup of command and address not considered): , eight cycles for quad mode (SDR) instructions in individual flash memory mode, and so on.
- Overhead because of clock domain crossing: one cycle

The following table lists the number of clock cycles required to read the data from the serial flash memory corresponding to the different settings of RBCT[WMRK]:

Table 782. Access duration examples for serial flash memory side

RBCT[WMRK] setting	Num bytes per DMA loop [1]	Num SCKFx for 80 MHz SCKFx		Time duration of flash memory data readout for 80 MHz SCKFx (~12.5ns period)	
		IFM [2] quad	IFM quad DDR	IFM quad	IFM quad DDR
0	4	8	4	~100ns	~50ns
1	8	16	8	~200ns	~100ns
3	16	32	16	~400ns	~200ns
7	32	64	32	~800ns	~400ns
11	48	96	48	~1200ns	~600ns

1. DMA loop refers to one minor loop completion that is equivalent to one major loop iteration.
2. Individual flash memory mode

NOTE

The table figure represents an ideal scenario; actual performance depends on how the chip integrates with DMA and QuadSPI modules.

A complementary example is when the watermark is set to be too high. In such a case, the time taken by the DMA to read out the RX buffer entries should be lesser than the time taken by the controller to push in the remaining entries in the buffer.

IPS bus side (data write)

The total number of bus cycles for each DMA minor loop completion are added from the following components:

- Overhead for each minor loop, given by DMA controller: assume 10 cycles
- Overhead because to clock domain crossing: assume two cycles
- Number of bus clock cycles required for 16 bytes (128-bit write size): assume four cycles (read/write sequence of DMA controller)

Note that the size of the minor loop is determined by the size of TBCT[WMRK]; therefore, the overhead specified above distributes among (TBCT[WMRK]+1) write accesses of 32-bit each.

The following table provides some examples for typical use cases:

Table 783. Access duration examples for bus clock side

TBCT[WMRK]	Number of bytes per DMA loop [1]	Number of bus clock cycles for DMA minor loop	Time duration of DMA minor loop for 80 MHz bus clock frequency
3	16	12+4 = 16	~200ns
7	32	12+8 = 20	~250ns

1. DMA loop refers to one minor loop completion that is equivalent to one.

NOTE

The table figure represents an ideal scenario; actual performance depends on how the chip integrates with DMA and QuadSPI modules.

Serial flash memory device side (data write)

The number of serial flash memory cycles can be determined in the following way:

- Number of serial flash memory clock cycles required to write 16 bytes, corresponding to four TX buffer entry (setup of command and address not considered): 32 cycles for quad SDR writes in individual flash memory mode.
- Overhead due to clock domain crossing: one cycle

The following table lists the number of clock cycles required to read the data from the serial flash memory corresponding to the different settings of TBCT[WMRK]:

Table 784. Access duration examples for serial flash memory side

TBCT[WMRK] setting	Num bytes per DMA loop [1]	Num SCKFx		Time duration for consuming data at flash memory interface 100 MHz SCKFx (10 ns period)[2]		Time for FIFO to get empty[3]	
		IFM [4] quad	[5] single IO SDR mode	IFM quad	PFM single IO SDR	IFM quad	PFM single IO SDR
3	16	32	64	320ns	640ns	2240ns	4480ns
7	32	64	128	640ns	1280ns	1920ns	3840ns

1. DMA loop refers to one minor loop completion that is equivalent to one major loop iteration.
2. Not all flash memory devices support writes at 100 MHz. See the flash memory data sheet for the actual page program frequency supported.
3. The assumption for these timings is that the TX Fifo is full when the transaction is initiated
4. Individual flash memory mode
5. Parallel flash memory mode

NOTE

The tables mentioned above are only examples which must be correlated with the DMA in the system.

Considering the examples provided in the two tables above for TX FIFO, it is evident that depending on the relationship between the bus clock and serial flash memory clock frequencies, there are settings possible where the serial flash memory consumes data faster than the IPS bus can write data in TX buffer. In these cases, a TX buffer underrun situation occurs. To avoid TX buffer underrun, the data transaction size should be large enough.

80.5.5 Flash memory devices address mapping

QuadSPI is configured in Single mode for the supported flash memory port A

The sizes of the flash memory devices are mapped with the system memory space based on the configurations of the following registers:

- SFA1AD
- SFA2AD

The total memory region for the flash memory devices is mapped between QuadSPI_AMBA_BASE and TOP_ADDR_MEMA2 such that the corresponding CS is asserted based on SFA1AD and SFA2AD register configurations.

80.5.5.1 Single mode

For single-die flash memories, you must write the same value to SFA2AD register that you write to the SFA1AD register.

Following is a programming example for single mode single-die flash memory:

- QuadSPI_AMBA_BASE - 1000_0000h
- SFA1AD[TPADA1] - 2000_0000h
- SFA2AD[TPADA2] - 2000_0000h

The following figure illustrates the memory mapping for single mode QuadSPI configuration.

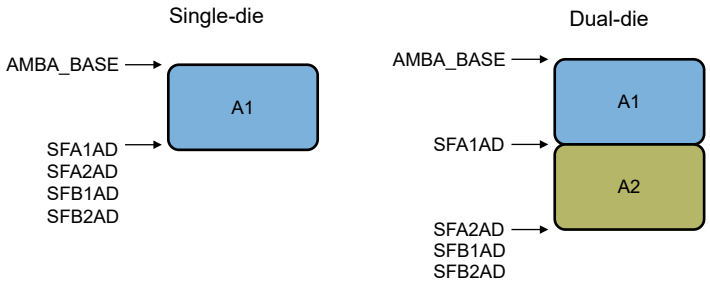

Figure 527. Memory map for Single mode

80.6 Byte ordering – endianness

The following topics show the byte ordering in 64-bit LE configuration for AHB buffer and 32-bit LE for TX/RX buffer.

80.6.1 Programming flash memory data

CPU writes instructions to the TBDR register, such as:

- Write TBDR: 4_03_02_01h
- Write TBDR: 8_07_06_05h

The following table shows the content against each TX buffer entry.

Table 785. Example of QuadSPI TX buffer

TX buffer entry	Content
0	4_03_02_01h
1	8_07_06_05h

Programming the TX buffer into the external serial flash memory device results in the following byte order to be sent to the serial flash memory:

- 01...02...03...04...05...06...07...08

80.6.2 Reading flash memory data into the RX buffer

Reading the content from the same address provides the following sequence of bytes, identical to the write case:

- 01...02...03...04...05...06...07...08

The following table shows the content against each TX buffer entry.

Table 786. Resulting RX buffer content

RX buffer entry	Content
0	4_03_02_01h
1	8_07_06_05h

80.6.2.1 Readout of the RX buffer through RBDRn

The RX buffer content appears at CPU read access through the peripheral bus interface in the following order:

- Read RBDR0: 4_03_02_01h
- Read RBDR1: 8_07_06_05h

80.6.2.2 Readout of the RX buffer through ARDBn

The RX buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- 32-bit access: Read ARDB0: 4_03_02_01h
- 32-bit access: Read ARDB1: 8_07_06_05h
- 64-bit access: Read ARDB0: 8_07_06_05_04_03_02_01h

80.6.3 Reading flash memory data into the AHB buffer

Reading the content from the same address as it was written to provides the following sequence of bytes, identical to the write case:

- 01...02...03...04...05...06...07...08

The following table shows the content against each TX buffer entry.

Table 787. Resulting AHB buffer content

AHB buffer entry	Content
0	8_07_06_05_04_03_02_01h

80.6.3.1 Readout of the AHB buffer through memory-mapped read

The AHB buffer content appears at read access on the AMBA AHB interface at the QuadSPI module boundary:

- 32-bit read access: 4_03_02_01h
- 32-bit read access: 8_07_06_05h
- 64-bit read access: 8_07_06_05_04_03_02_01h

80.7 Driving flash memory control signals in single and dual modes

In single and dual modes, the serial flash memory devices that can connect to the QuadSPI module expect additional control signals on the inputs, which are connected to IOFA[3], IOFA[2] in the quad mode. For easy interfacing, the outputs IOFA[3:2] for flash memory A are driven to the logic state given by the configuration fields MCR[ISD3FA], MCR[ISD2FA].

These outputs are driven all the time to the logic level programmed in the MCR except the time when quad commands of the serial flash memory are executed. See the specifications of the related serial flash memory device for details about the inactive level.

80.8 Serial flash memory devices

Several different vendors make flash memory devices with a QuadSPI interface. At present, there is no set standard for the QuadSPI instruction set. The most common commands currently have the same instruction code for all vendors; however, some commands are unique to specific vendors. Some of the example sequences are provided in the following sections.

80.8.1 Example sequences

This section provides the example sequences of the QuadSPI module.

Table 788. Exit 4 x I/O read enhance performance mode (XIP) (Macronix) and read status

Instruction	Pad	Operand	Description
CMD	0h	EBh	4xIO read command
ADDR	2h	18h	24-bit address to be sent on four pads
MODE	2h	0h	2 mode cycles (exit XIP)
DUMMY	2h	4h	4 dummy cycles
READ	2h	8h	Read 64 bits
CMD	0h	5h	Read Status register
READ	0h	1h	Status register data
STOP	0h	0h	Stop, instruction over

80.8.1.1 Fast read sequence (Macronix/Numonyx/Spansion/Winbond)

The following table shows the fast read sequence for Macronix/Numonyx/Spansion/Winbond flash memories.

Table 789. Fast read sequence

Instruction	Pad	Operand	Description
CMD	0h	Bh	Fast read command = 0Bh
ADDR	0h	18h	24 address bits to be sent on one pad
DUMMY	0h	8h	Eight dummy cycles
READ	0h	4h	Read 32 bits on one pad
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

80.8.1.2 Fast read quad output (Winbond)

The following table shows the fast read quad output sequence for Winbond memories

Table 790. Fast read quad output sequence

Instruction	Pad	Operand	Description
CMD	0h	6Bh	Fast read quad output command = 6Bh
ADDR	0h	18h	24 address bits to be sent on one pad
DUMMY	2h	8h	Eight dummy cycles
READ	2h	4h	Read 32 bits on four pads
JMP_ON_CS	0h	0h	Jump to instruction 0 (CMD)

NOTE

If DLL is disabled then JMP_ON_CS or STOP instruction can be used else only STOP instruction can be used.

80.8.1.3 4 x I/O read enhance performance mode (XIP) (Macronix)

The following table shows the 4 x I/O read enhance performance mode for Macronix flash memories. The enhanced performance mode is also known as XIP mode.

Table 791. Fast read quad output sequence

Instruction	Pad	Operand	Description
CMD	0h	EBh	4xI/O read command = EBh
ADDR	2h	18h	24 address bits to be sent on four pads
MODE	2h	A5h	Two mode cycles
DUMMY	2h	4h	Four dummy cycles
READ	2h	4h	Read 32 bits on four pads
JMP_ON_CS	0h	1h	Jump to instruction 1 (ADDR)

When in XIP mode, the software must ensure that all the flash memories connected to the controller are in this mode. As a part of initializing the controller, all the flash memories might be enabled with XIP by carrying out dummy reads.

80.8.1.4 Dual command page program (Numonyx)

The following table shows the dual command page program sequence for Numonyx flash memories.

Table 792. Dual command page program sequence

Instruction	Pad	Operand	Description
CMD	1h	2h	Dual command page program = 02h on 2 pads
ADDR	1h	18h	24 address bits to be sent on two pads
WRITE	1h	20h	Write 32 bytes on two pads

Table continues on the next page...

Table 792. Dual command page program sequence (continued)

Instruction	Pad	Operand	Description
STOP	0h	0h	Stop, instruction over

80.8.1.5 Sector erase (Macronix/Numonyx/Spansion)

The following table shows the Sector erase sequence for the Macronix/Numonyx/Spansion flash memories.

Table 793. Sector erase sequence

Instruction	Pad	Operand	Description
CMD	0h	20h	Sector erase command = 20h
ADDR	0h	18h	24 address bits to be sent on one pad
STOP	0h	0h	Stop, instruction over

80.8.1.6 Read status register (Macronix/Numonyx/Spansion/Winbond)

The following table shows the read status register sequence for Macronix/Numonyx/Spansion/Winbond flash memories.

Table 794. Read status register sequence

Instruction	Pad	Operand	Description
CMD	0h	0h5	Read status register command = 05h
READ	0h	0h1	Read status register data
STOP	0h	0h	Stop, instruction over

80.9 Sampling of serial flash memory input data

80.9.1 Basic description

QuadSPI is used to read data from the serial flash memory device. Depending on the actual implementation, there is a delay between the internal clocking in the QuadSPI module and the external serial flash memory device. See the following figure for an overview of this scheme.

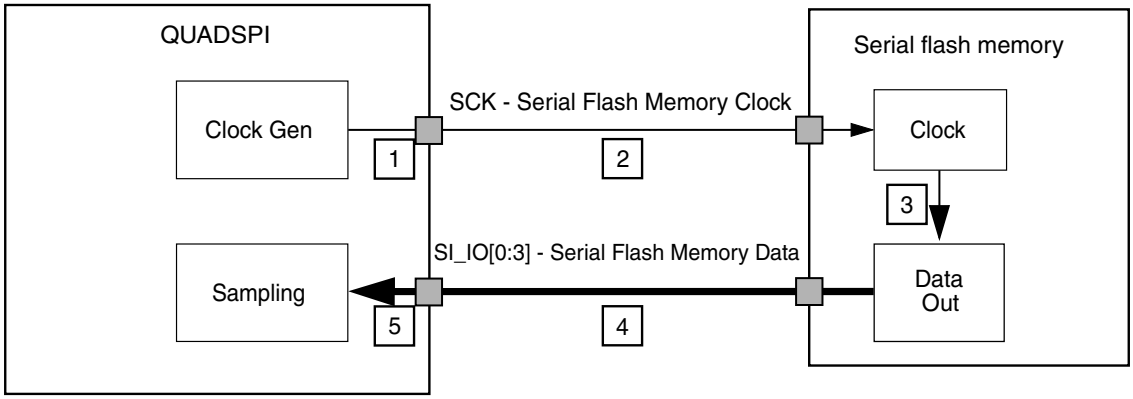

Figure 528. Serial flash memory sampling clock overview

The rising edge of the internal reference clock is taken as timing reference for the data output of the serial flash memory. After a time of t_{total_delay} the data arrives at the internal sampling stage of the QuadSPI module. Considering the figure provided here, the following parts of the delay chain contribute to t_{total_delay}:

- Output delay of the serial flash memory clock output of the device containing the QuadSPI module
- Wire delay of application/PCB from the device containing the QuadSPI module to the external serial flash memory device
- Clock to data out delay of the external serial flash memory device, including input and output delays
- Wire delay of application/PCB from the external serial flash memory device to the device containing the QuadSPI module
- Device delay corresponding to the input data

NOTE

The t_{total_delay} is specific to the characteristics of the actual implementation.

80.9.2 DQS sampling method

80.9.2.1 Basic description

In the DQS mode, the data strobe signal (DQS/RWDS) is used to sample the read data. Here, both DQS and the data sent by the flash memory move in the same direction; therefore, it is relatively easier to achieve at higher frequencies.

When using DQS for SDR reads, QuadSPI internally samples the incoming data on the rising edge of the strobe signal.

The next figure shows the sampling read data in the SDR mode using the DQS.

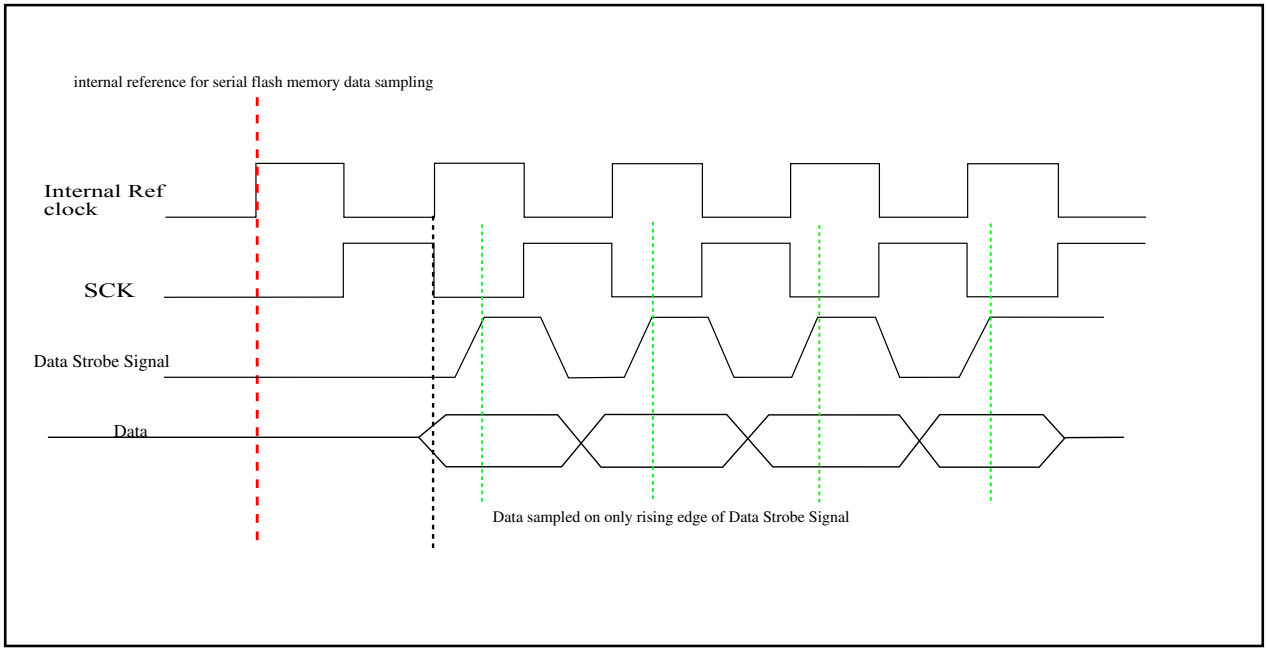

Figure 529. Data strobe functionality in SDR mode for read operation.

NOTE

Consider "Data Strobe Signal" as "Data Strobe Signal driven by memory" and "Data" as "Data from memory".

NOTE

Refer to the Datasheet for specific timing waveforms of QuadSPI

NOTE

For Specific details - Refer to the Data Sheet specification of QuadSPI module.

80.9.2.2 Dummy Pad loopback

The internal clock is loop-backed from the dummy internal pad to compensate data pad delays. This can be enabled by configuring the value of MCR[DQS_FA_SEL] as "01" for flash memory A. This mode can be used with the following configuration:

- High/low frequency delay chain manual programming in bypass mode using DLLCRA[SLV_DLY_COARSE] and DLLCR[FREQEN].
- DLL-assisted sampling only using DLLCRA[DLLEN]

NOTE

Refer to chip-specific QuadSPI section or datasheet for 'Fixed sampling tap specific settings/details' without DLL (in bypass mode).

- DLL-assisted auto data learning using DLLCRA[DLLEN] and along with MCR[DLPEN]

NOTE

Refer to Auto-DataLearning (4x Sampling method) section with DLL for further details

80.10 DLL and delay chain usage

The DLL is a general-purpose, dynamically adaptive clock delay module. It provides the ability to select a quantized delay (in fractions of the clock period) regardless of on-chip variations such as process, voltage, and temperature (PVT). The DLL is suitable for applications where accurate delay adjustment is required, such as in case of DDR interfaces.

DLL working concept

The DLL control loop consists of a counter, reference delay line, and phase detector which operate on the ref_clock reference clock input. The reference clock (clk_ref) is fed into the reference delay line. After reset, a single delay tap is selected. A phase detector is used to detect the condition where a half shift has occurred. In addition to this, signals are generated to either increment or decrement the counter, which controls the delay line (if the half-phase detect condition is not met). Any changes in the delay of the individual elements of the delay chain (because of PVT) automatically cause the phase detector logic to determine if a change in the counter value is required. After the half-phase shift is detected, an internal lock signal is generated, and after a lock event occurs, the slave delay chain is ready to be updated based on a triggering event.

Slave delay chain programming sequence—

Following is the programming sequence for DLL bypass mode.

1. Program DLLCRA[SLV_EN]=1, DLLCRA[SLV_DLL_BYPASS]=1, and DLLCRA[SLAVE_AUTO_UPDT]=0.
2. Program the following fields to provide the desired DQS delay for sampling: DLLCRA[SLV_FINE_OFFSET], DLLCRA[SLV_DLY_COARSE], and DLLCR[FREQEN]. See the chip-specific QuadSPI information for the supported programming settings.
3. Program DLLCRA[SLV_UPD]=1 to load these values in the slave delay chain.
4. Check the slave delay chain update status by polling DLLSR[SLVA_LOCK]=1 and clear DLLCRA[SLV_UPD] after confirming the update state.

Following is the programming sequence for DLL auto update mode.

1. Program DLLCRA[SLV_EN]=1, DLLCRA[SLV_DLL_BYPASS]=0, and DLLCRA[SLAVE_AUTO_UPDT]=1.
2. Program the DLL configuration by using DLLCRA[DLL_REFCNTR] and DLLCRA[DLLRES]. See the chip-specific QuadSPI information for the supported DLL configuration settings.
3. Program the slave settings to delay DQS by using these fields: DLLCRA[SLV_FINE_OFFSET], DLLCRA[SLV_DLY_OFFSET], and DLLCR[FREQEN]. See the chip-specific QuadSPI information for the supported settings.
4. If offset delay needs to be updated on the slave chain, program DLLCRA[SLV_UPD]=1.
5. Enable DLL by programming DLLCRA[DLLEN]=1 and reset DLLCRA[SLV_UPD]=0. Slave delay chain is updated automatically and can be checked by polling DLLSR[SLVA_LOCK]==1

80.11 Data input hold requirement of flash memory

In the DDR mode, the data is valid only for half clock cycle. It is difficult to meet the data input hold time requirement for flash memory. QuadSPI internally delays the data sent to flash memory so that it becomes easy to meet the hold requirement. The FLSHCR[TDH] is used for this purpose. If FLSHCR[TDH] is configured to 0, then the data sent to flash memory is aligned with the internal reference clock of QuadSPI. If it is 1, then the data is aligned to 2x internal reference half clock.

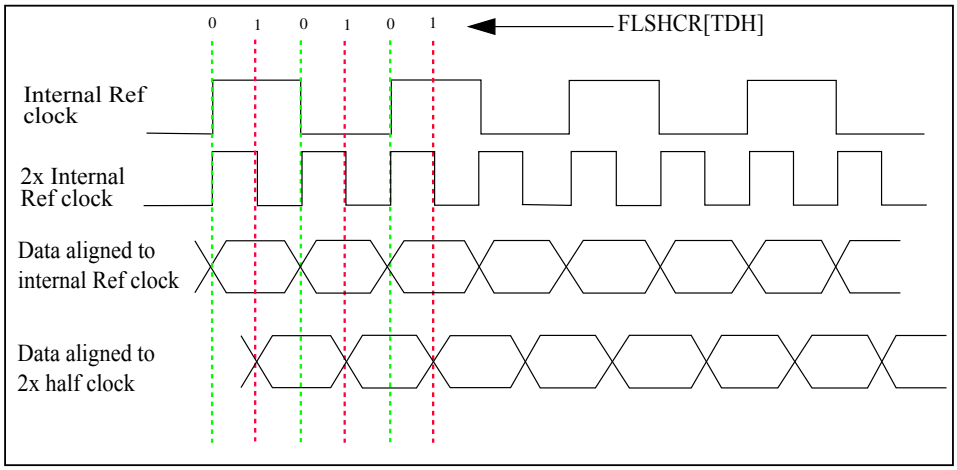

Figure 530. Data hold

80.12 Secure flash protection

This secure flash module enforces access control policies based on the MGID, privilege and secure attributes of the IPS transactions. All accesses throughout the flash device need to be monitored to determine the validity of all accesses. If transaction from a given master has appropriate access rights, it is forwarded to flash, else the access is denied, and an error is generated.

There are two level of checks present in this module, based on MDAD and FRAD descriptors programmed. First level checks the input transactions based on secure attribute and MGID associated with that transaction which are checked according to MDAD. Second level check selects the appropriate FRAD based on address range of transaction. And each FRAD allows the transaction to pass through only when secure, privilege and other MGID related attributes are matching. Else the transaction is not forwarded and IPS bus error/interrupt is generated. Flash regions can be programmed to cover the entire address space to provide a default set of access permissions. For flash read transactions only first level of check is enabled.

Software can bypass both or anyone of these checks by writing to MGC[GVLDFRAD], MGC[GVLDMDAD] and MGC[GVLD] fields.

The IPS masters should write on QuadSPI register (SFAR, IPCR and TBDR) addresses for generating transfers to flash. SFP block monitors these IPS transfers and checks if the write is being done on SFAR or IPCR registers and forwards them for MDAD and FRAD checks. If the transaction passes both checks then it is passed through to QuadSPI register else bus error or interrupt is generated. FRAD check is only done for flash write transactions not for read. Actual write on QuadSPI SFAR and IPCR register is done by SFP module only after the transaction passes MDAD and FRAD checks. There is only a single IPS slave interface which can be used for QuadSPI IPS register access and SFP IPS register access.

An IPS master transaction is secure if IPS_NONSECURE_ACCESS attribute is set to 0 for that transaction. An IPS master transaction is privileged if IPS_SUPERVISOR_ACCESS attribute is set to 1 for that transaction.

QuadSPI SFP related register sets are present here.

80.12.1 MDAD

These descriptors form the first level of checks on the input IPS transaction. There are two target group queues (TG0 and TG1) present in SFP block and each of these queues can be programmed with different set of MGAD descriptors checks in TG*n*MDAD registers. These registers are under access control and can only be programmed by privilege masters. These descriptors (one or both) should be programmed before start of any flash transaction else any IPS write on SFAR, IPCR or TBDR registers will generate an IPS bus error. After programming the target group descriptor the TG*n*MDAD[VLD] should be set to 1 for that register.

There are two target group queues (TG0 and TG1) so two transactions by different master ID can be stored inside SFP block while one of them is being processed by QuadSPI.

80.12.1.1 MDAD checks

- Secure check – This is decided by the TG*n*MDAD[SA] field of the MDAD descriptor. If the fields are set to 01 then queue is reserved for only non-secure transactions. If set to 10 then queue is reserved for only secure transactions. If the bits are set to 11 then this check is bypassed.
- MasterID check – This check compares themasterID of the input transaction with the MID match value set inTG*n*TG*n*MDAD[MIDMATCH]fields and allows only matching transactions inside the queue. There are 6 mask fields (TG*n*TG*n*MDAD[MASK]) inside the descriptor. If the mask type (TG*n*TG*n*MDAD[MASKTYPE]) is set to 0 then the input transactions master ID is ANDed with the mask bits before comparing with the MID match value. If the mask type is set to 1 then the input master ID is ORed with the masks bits and then compared with the MID match bits. Multiple master IDs can be allowed inside the queue using this mask.

When an IPS write is done to SFAR or IPCR registers then SFP block checks the attributes with MDAD descriptors of both the queues. If the attributes match with descriptor of any queue, then the value is written inside that queue and master ID is assigned to that queue. The queue is considered locked once the SEQID bits of IPCR register are written. So software should ensure that IPCR SEQID bits are written only after SFAR and other IPCR bits like DATSZ are written in that queue. The queue will be unlocked when flash transfer is completed for that transaction.

Once a master ID is assigned to a queue then transactions with only that master ID are allowed inside the queue. Any write of SFAR/IPCR is mapped to this queue even if other queue is free. So same master ID cannot have transaction on both queues at a time. The data in the queue is cleared once the flash transaction is finally completed by the QuadSPI.

The data path for input IPS writes to SFAR or IPCR registers are shown in the following figure.

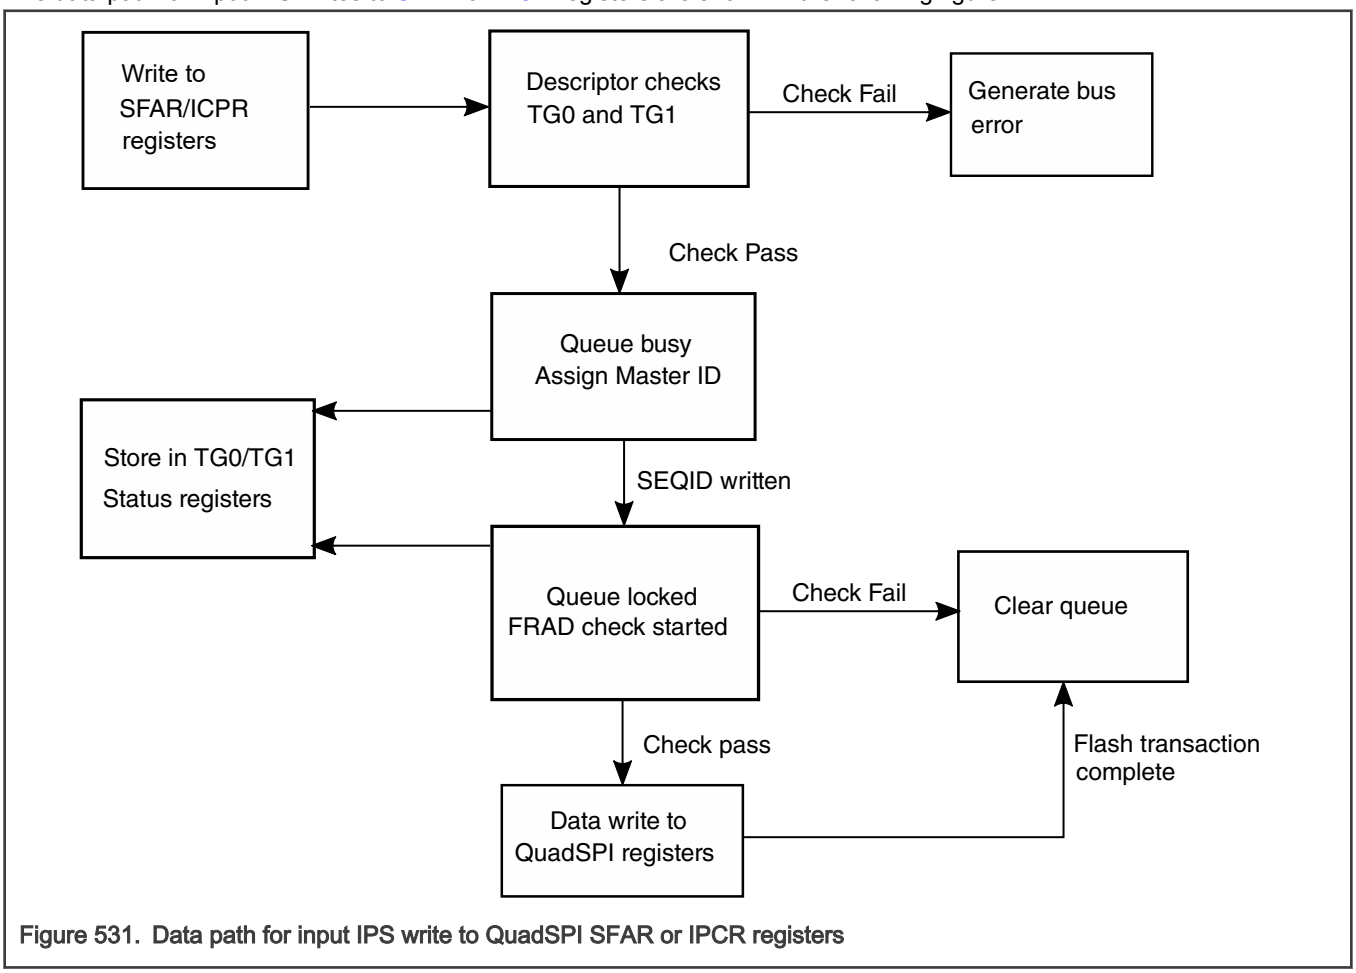

Figure 531. Data path for input IPS write to QuadSPI SFAR or IPCR registers

If the SFAR write passes first level of MDAD checks then the value is written in SFP register TG*n*SFAR and valid bit is set in TG*n*SFARS register and queue is considered as busy. Similarly when ICPR write passes the checks, its value is written into TG*n*IPRCS register and TG*n*IPRCS[VLD] field is set to 1 and queue is considered as locked. It is mandatory that IPCR is

written only after SFAR has been written for a queue and queue is busy. If IPCR is written before SFAR then it will result in IPS transfer error. Master should ensure that it completes the programming sequence for flash access request (write SFAR and IPCR with SEQID) so that target queue is not left after writing SFAR or IPCR without the SEQID. Both queues TG0 and TG1 are processed in round robin arbitration. The queue receiving the data first is processed first and next queue is processed after the first transfer completes.

NOTE

TBDR register write is not allowed until the SFAR and IPCR entries of that master has passed MDAD and FRAD checks and the transaction is queued for writing to QuadSPI. If TBDR registers are written before arbitration win, transfer error will be generated. IPS master can read FSMSTAT register to check the status of their transaction. TBDR access is allowed when FSMSTAT[VLD] field is set and for the master whose master ID matches with fields [11:8] of this register, and field [1:0] are set to 01 or 10. IPCR and SFAR registers are forwarded to QuadSPI only after the TX buffer is filled till watermark level in case of write transactions. IPCR should be written only after SFAR has been written successfully to a queue.

80.12.1.2 Error conditions

The error conditions for first level of MDAD checks and the response is given in table below. These error conditions can occur when SFAR, IPCR or TBDR registers are being written.

NOTE

Queue is considered busy if it has been written successfully once with any of the values SFAR, IDATSZ or PAR. Queue is considered locked when SEQID has been written successfully by passing MDAD checks.

Table 795. MDAD check error conditions

Error condition	Response	Common/Queue error
None of the queue descriptors are programmed	IPS transfer error is generated	Common error
Both queues are locked	IPS transfer error is generated	Common error
Both queues are busy and another master writes whose master ID is not matching with either queue.	IPS transfer error is generated.	Common error
Queue busy and same master writes SFAR or IPCR registers with wrong security attribute	IPS transfer error is generated and queue is cleared (SFAR and IPCR needs to be written again for transfer to start).	Queue error
Queue is locked and same master writes	IPS transfer error is generated	Common error
If master ID of transaction doesn't qualify MID check of any of the queues	IPS transfer error is generated	Common error
If both the queues are empty and security attribute of transaction doesn't match with any of the queues	IPS transfer error is generated	Common error
TBDR register is written before SFAR and IPCR SEQID qualifies MDAD checks	IPS transfer error is generated	-
If none of FRAD descriptors are programmed	IPS transfer error is generated	Common error

Table continues on the next page...

Table 795. MDAD check error conditions (continued)

Error condition	Response	Common/Queue error
IPCR is written before SFAR	IPS transfer error is generated	Common Error - If the transaction doesn't matches the security attribute check or MID check of any MDAD. No common or queue error - If it matches security and MID attribute of any queue.

When a common error is generated its details are latched in IPSERROR register and corresponding error field is set to 1. This register will tell if the transaction failed because of queue locked, MID mismatch or security failure along with the master ID of that transaction. This register will keep the last error transaction latched unless cleared by writing 1 to CLR bit of this register. Then from next cycle onwards this register can latch new errors. Common error will also be generated if none of the FRAD descriptors are programmed. In case a queue is busy and same master writes IPCR or SFAR with wrong security attributes the queue is cleared, the Target Group n SFAR Status (TG0SFARS - TG1SFARS) valid bit goes low. In this case the master should write the SFAR an IPCR again for proper transaction to start.

In case of queue error the details are latched in Target Group n IPCR Status (TG0IPCRS - TG1IPCRS) or Target Group n SFAR Status (TG0SFARS - TG1SFARS) registers. These registers will also keep the error status latched until cleared by writing 1 to CLR bit of respective registers.

80.12.2 FRAD

These descriptors form the second level check for IPS flash write and flash erase transactions. IPS read transaction are not processed by this level of check and are passed through after MDAD checks. There are 8 FRADs which can be programmed by privilege masters. So the access checks can be programmed for up to 8 unique address ranges. Each of the address range is equipped with different access attribute checks and based on this write access can be controlled for the flash region. These descriptors must be programmed before starting transactions on flash.

After programming the FRAD*n*_WORD0, FRAD*n*_WORD1, FRAD*n*_WORD2 and FRAD*n*_WORD3 registers, FRAD*n*_WORD3[VLD] field should be written 1. SFP block doesn't consider the FRAD descriptors which are not valid. If none of the FRAD are programmed, then error interrupt will be generated if enabled, and transaction is not forwarded to QuadSPI.

There is a descriptor lock feature to prevent spurious changes to the FRAD. FRAD*n*_WORD3[LOCK] can be programmed to make all FRAD registers as read only or to allow write access to all or some masters with specific master ID.

80.12.2.1 FRAD checks

- Address range checks – Start and end address for FRAD region are programmed in FRAD*n*_WORD0 and FRAD*n*_WORD1 registers. Start address of IPS flash transaction written in SFAR register and data size programmed in IPCR register, is used to check if the transaction lies within any of the FRAD address ranges. This address range match will be used to select the corresponding FRAD from which other access checks will be done. The start and end address are programmed around 64 KB boundary so 16 MSB are only used for range check..

  The data size should not be programmed as 0 in IPCR register for normal data transfers to flash and actual size should be programmed. In the cases where only flash instruction has to be send and no data has to be written in TBDR register, this DATSZ can be programmed as 0. In case the DATSZ is programmed as 0 in IPCR, SFP module blocks the write access to TBDR register and if any write is done then that generates IPS transfer error.

- Exclusive access lock – Exclusive master access lock can be enabled over any flash address defined under a FRAD. The master ID of the master which enables/owns the exclusive access is captured in FRAD*n*_WORD2[EALO] fields. Once enabled, the exclusive lock can be released only by the same master which enabled the lock by writing on FRAD*n*_WORD3[EAL] fields. The exclusive write access permissions of a flash region are decided as given in table below:

Table 796. Exclusive access lock

FRAD*n*_WORD3[EAL]	Write permissions
00	No lock. The write permissions are decided as set in FRAD*n*_WORD2[MDnACP] fields for respective master domain.
10	Write permissions are revoked for all masters. Any write transaction coming to this flash address region will not be forwarded through and will result in an error.
11	Write permissions are revoked for all masters except the master ID matching the ID specified by FRAD*n*_WORD2[EALO] fields.

- Flash region privilege checks – If the FRAD*n*_WORD3[EAL] fields are set to 00 then flash write access permissions for any IPS master is decided based on the settings done in FRAD*n*_WORD2[MDnACP] fields as given in table below. MD0ACP permission checks are done for transaction coming through target group 0 queue (TG0) and MD1ACP permission checks are for transactions coming through target group 1 queue (TG1).

Table 797. Flash region privilege checks

MDxACP value	Privilege access	Secure access	Write access
111	No	No	Not allowed
	No	Yes	Not allowed
	Yes	No	Allowed
	Yes	Yes	Allowed
110	No	No	Allowed
	No	Yes	Allowed
	Yes	No	Allowed
	Yes	Yes	Allowed
101	No	No	Not allowed
	No	Yes	Not allowed
	Yes	No	Not allowed
	Yes	Yes	Allowed
100	No	No	Not allowed
	No	Yes	Allowed
	Yes	No	Not allowed
	Yes	Yes	Allowed
0xx	-	-	Not allowed

If any transaction fails FRAD check then error interrupt is generated if enabled.

FRAD status registers keep the details of last transaction which lie within the address range of that respective FRAD and will be updated only when a new transaction comes which falls within the same address range.

Flash Region Compare Address Status (FRAD0_WORD4 - FRAD7_WORD4) register stores the flash start address that was compared and Flash Region Compare Status Data (FRAD0_WORD5 - FRAD7_WORD5) contains the master ID, privilege and secure attributes of the transaction. The transaction details are stored in FRAD register for which the address compare check passed. These status registers are not updated in case of read transfers or when FRAD check is disabled. For example, if the transaction address lies in the range set in FRAD2_WORD0 and FRAD2_WORD1 then the transaction details will be stored in

FRAD2_WORD4 and FRAD2_WORD5 registers and valid field [30] will be set. If transaction fails, the security or privilege attribute check for the corresponding FRAD then error field [29] is set in FRADx_WORD5 status register. This bit and other transaction details will remain latched unless cleared by writing '1' to W1C bit of corresponding FRAD in ERRSTAT register.

If transaction address doesn't match any of the FRAD address range or if matches with multiple FRAD address ranges, then also error interrupt is generated. But for no FRAD match, the details will not be stored in any of the FRAD status registers.

FRAD checks are done only for flash write transactions, flash read transactions are passed through to QuadSPI if MDAD checks are passed. At least one FRAD region should be made valid (if the FRAD check is enabled from MGC register) for flash read instructions to go through even when FRAD check is not done for read instructions. SFP module checks if a transaction is read or write from the SEQID written in IPCR register and LUT table programmed inside QuadSPI. Master Read Command (MRC) register shows the read command code which SFP block identifies. There are two command codes which are predefined READ_DDR and READ commands. Software can program two other command code as per its convenience by writing into fields [21:16] or [29:24] and then writing respective valid bit as 1.

80.12.2.2 Error conditions

Any transaction passing the MDAD checks will be checked for FRAD checks and can lead to following error scenarios.

Table 798. Error conditions

Error condition	Response
None of the FRAD are programmed	IPS transfer error will be generated and status will be latched in IPS_ERROR register
Transaction address doesn't fall within any of the FRAD address range	Error interrupt will be generated if enabled
Transaction match with multiple FRAD address range	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Transaction passes FRAD address check but fails privilege or security checks	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Transaction passes FRAD address check but range was locked by EAL bits	Error interrupt will be generated if enabled. Error bit will be set, and status will be stored in FRADx_WORD5 status registers for whom the address check passed
Read transaction	No FRAD check will be done and no error will be generated for FRAD failure. But if FRAD check is enabled in MGC then at least one FRAD should be valid else it will give error during SFAR/IPCR write

80.12.2.3 Atomic commands considerations

For security reasons, the atomic commands (where flash's internal configuration region is accessed) like flash erase etc. should always be programmed in last 6 SEQID locations of LUT. FRAD0 has access to all the LUT locations including these last 6 SEQID. Remaining FRAD regions will not allow write access if the IPCR SEQID is set for any of the last 6 locations of LUT. It will result in FRAD access error and it will set in FRAD status registers. Also the software must set the FRAD0 MDACP to 101 so that write access is allowed only for secure privilege masters. This is done to ensure that no other master can use the atomic commands like flash erase to change the contents of flash. So when any master wants to use these atomic command programmed in last 6 locations of LUT it will have to write FRAD0 start address in SFAR and keep IPCR DATSZ such that it falls under FRAD0 address region and MDACP programmed in FRAD0 are checked.

For flash configuration in case of dual-die the software needs to change the address range of FRAD0 accordingly so that address goes to second die. Similar consideration to be taken in case of dual flash where Port A and B are being used.

80.12.3 TBDR register write lock

SFP module keeps the TBDR write locked for IPS transactions by default. When a IPS master writes SFAR and IPCR transactions and this transaction passes MDAD and FRAD checks then the accesses are unlocked for that master ID. Lock and unlock procedure is shown with an example in figure below:

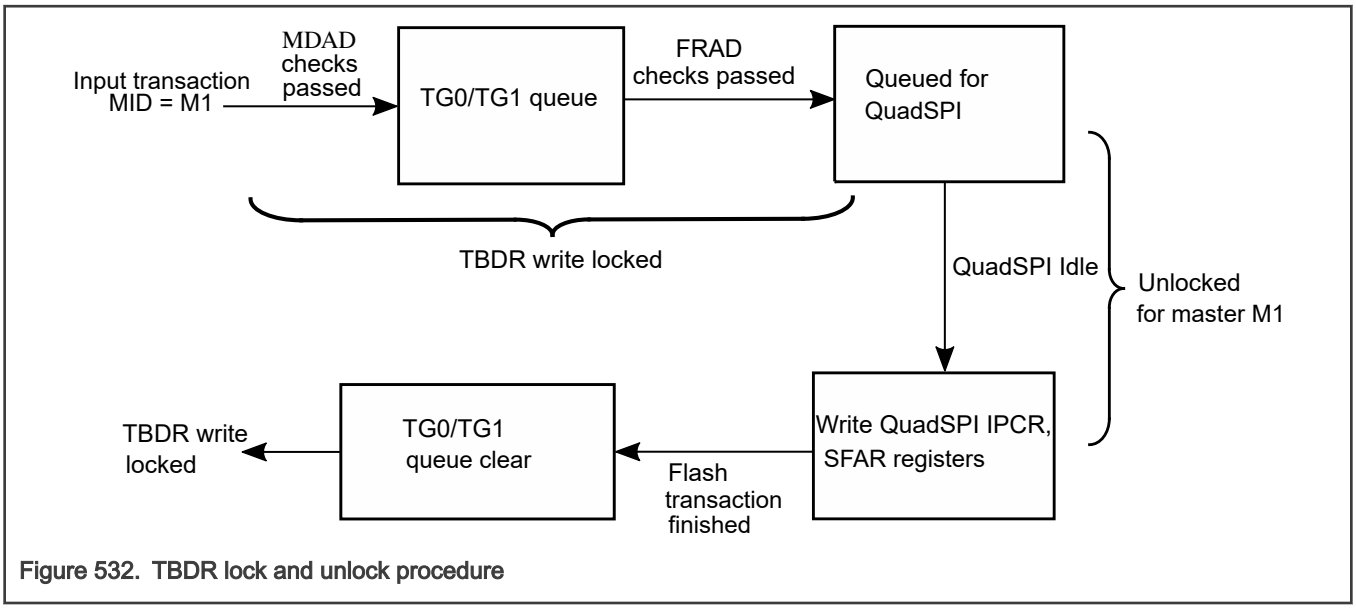

Figure 532. TBDR lock and unlock procedure

If any master writes on TBDR register when it is not unlocked for that master ID it will result in IPS transfer error. IPS master should ensure that it writes the TBDR register once QuadSPI registers have been written by the SFP module. This can be checked by reading FSM Status (FSMSTAT). Bits [11:8] of this register tells which master ID is currently active, and if the value of bits [1:0] is 01 or 10 and bit 31 is set as 1, then the TBDR lock is open for write transactions. It is advisable that for write transactions where IDATSZ is non zero, master clears the TBDR buffer from any residue data and program the TBCT[WMRK] watermark once its request is granted in arbitration (FSMSTAT bit [1:0] are 01). In case of transfers having IDATSZ programmed as 0 the TBDR register remains locked and data can't be written to this register. In case DMA is being used to fill the TBDR buffer, program RSER[TBFDE] field to 1 only when write access is granted and TBDR access is unlocked after checking FSMSTAT[STATE] field. Once DMA completes the TBDR write reset, this field is set back to 0. After this, the SFP will write SFAR and IPCR to QuadSPI triggering the flash transfer. It should be made sure that the DMA should have same master ID as the master which won the arbitration.

80.12.4 Transaction status registers

SFP module has two registers (FSM Status (FSMSTAT) and FlashSeq Request (FLSEQREQ)) which shows the current and last transaction status. These registers are updated only after MDAD and FRAD check are passed.

- FSM Status (FSMSTAT) register shows the current transaction which is queued for QuadSPI when valid field [31] is set. Field [16] of this register if set to 1 then it is a non-read instruction sequence and it is set to 0 then it means that this is a read sequence. Fields [11:8] show the master ID from which this transaction is generated. Fields [1:0] show the current state of active transaction when valid field [31] is set.

  The figure below shows the IPS transaction flow inside SFP block along with various values of bits [1:0]:

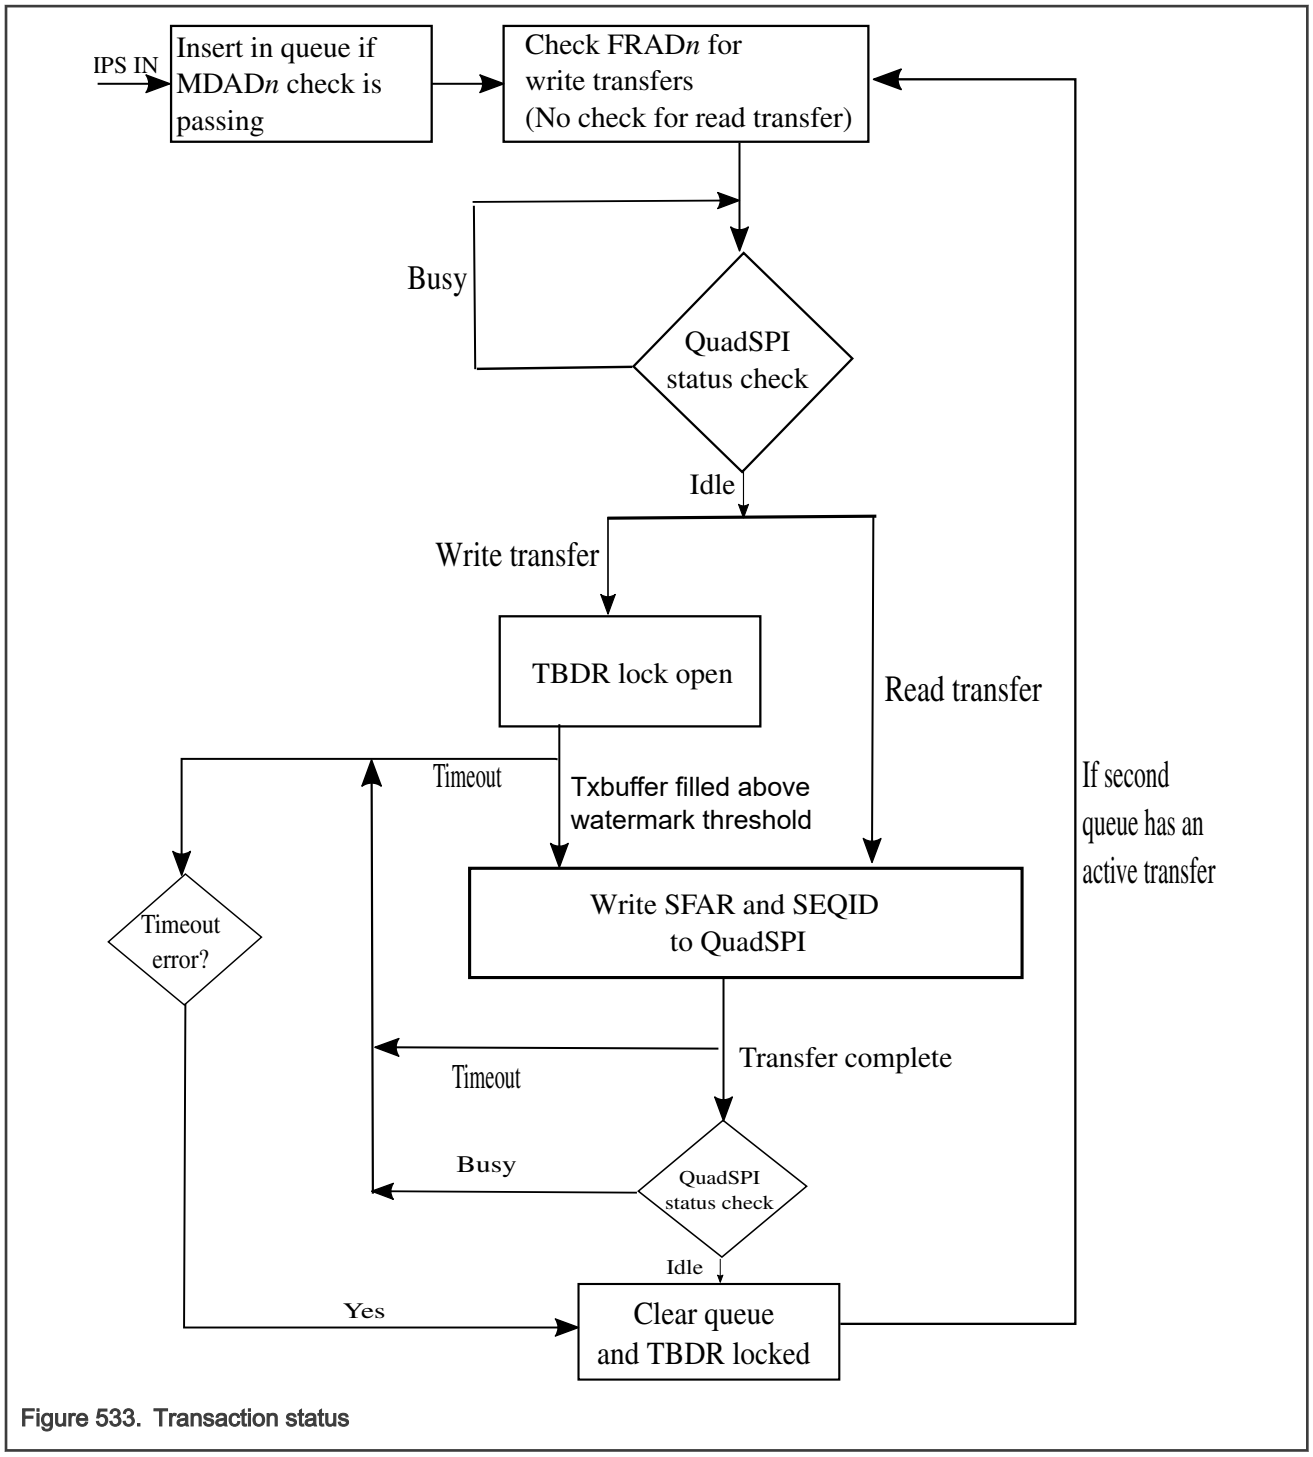

Figure 533. Transaction status

NOTE

If the DATSZ programmed in TG0/TG1 IPCR register is more than the TX buffer watermark threshold value (256-Watermark programmed in TBCT) then it waits for threshold to cross before writing the SFAR and IPCR registers to QuadSPI. Else SFP block waits for one entry to be written to TBDR register and after that it writes the SFAR and IPCR to QuadSPI thus triggering the transfer. In case of read transfers, SFAR and IPCR are written as soon as QSPI is IDLE.

NOTE

QuadSPI is considered IDLE if transaction is finished at flash, No DMA and interrupt pending and RX data is completely read. In case RX data is pending it can be cleared by writing to MCR[CLR_RXF]. Refer to section Timeout error for more details.

FSM state values in FSM Status (FSMSTAT) for different states are in the following table:

Table 799. FSMSTAT register field details

FSMSTAT register fields	
VLD	0 - No IPS transfer is queued for launch to QuadSPI 1 - IPS transfer is queued or running in QuadSPI
STAT	00 - QuadSPI is busy with AHB transfer, any DMA transfer is pending, RDBFL has residue data or any interrupt is pending. 01 - TBDR lock is open. QuadSPI considers IPS transfer. AHB transfer should not start. 10 - TX buffer filled above threshold. Write transfer is triggered. SEQID is written. 11 - Read transfer is triggered. SEQID is written.

For flash write transfers which passes MDAD and FRAD checks and QuadSPI is not busy with any previous transfer, TBDR lock is opened and bits [1:0] shows value of 01. Once the IPS master fills the TX buffer till the level where free entries in TX buffer are less than the watermark threshold set in TX Buffer Control Register (TBCT) and SR[TXWA] flag is de-asserted, SFP block writes the SFAR and IPCR entries to QuadSPI registers and transaction is triggered. To avoid underrun, program the watermark accordingly for size of the data to be transferred. This programming can be done when TBDR access is allowed after arbitration is granted. TBCT Watermark can be programmed as 256-(IDATSZ/4-1) in most of the scenarios. If the DATSZ entry written in IPCR is less such that TX buffer can never be filled till watermark threshold, in such cases SFP block does not wait for the TBCT[WMRK] to trigger and writes the SFAR and ICPR registers as soon as one data entry is written to TBDR register. When the SFAR and IPCR register are written, bits [1:0] are set to 10. In case of flash memory read transfers SFAR and IPCR entries are written to QuadSPI as soon as QuadSPI is IDLE and bits [1:0] are set to 11. QuadSPI is considered IDLE only if no AHB/IPS transfer is ongoing, any DMA transfer is not pending, RDBFL doesn't have residue data and any interrupt is not pending (FR[TFF], FR[TBFF], FR[TBUF], FR[RBDF], FR[RBOF], FR[ABOF], FR[AIBSEF], FR[AITEF], , , FR[IPIEF], , FR[ILLINE], ,). Valid bit [31] goes to 0 once the IPS transfer is completed. IPS master should clear the TX buffer before writing to TBDR register to ensure that no data from previous transaction is left in TX buffer.

If the IPS transaction has passed the MDAD and FRAD checks but QuadSPI is busy with some AHB transfer, then the bits [1:0] are set to 00. Other than ongoing AHB transfer QuadSPI can be busy because of other reasons also like if any TXDMA or RXDMA pending, if read buffer has data pending or if any QuadSPI interrupt is enabled and pending for servicing. So IPS master should ensure that no interrupt is pending or previous read transfer is completed. If the QuadSPI remains busy for a longer time it may result in timeout error.

Software must take care that no AHB transaction is launched when any IPS transaction is ongoing, TBDR lock is open or IPS transaction is getting executed on QuadSPI. It can be checked by reading this FSM status register. if the valid bit is 1 and bits [1:0] are set to 01, 10 or 11 then no AHB transfer should be generated towards QuadSPI.

For any IPS initiated RW transaction which needs two separate transactions at flash interface, like Write-Enable transaction followed by Write-data transaction (Data-Learn flash transaction followed by Read-data transaction) at flash interface must be joined together with JMP_2_SEQ instruction.

- FlashSeq Request (FLSEQREQ) register holds the details of transaction which was last send to QuadSPI. After a flash transaction is completed this register is updated and its valid field [31] is set to 1. This register holds the command type (read or write), transaction master ID (fields [3:0]), target group queue (TG0 or TG1) from which this transaction passed in field [4], privilege and secure attributes for the transaction, SEQID (fields [19:16]) and number of flash descriptor FRAD within whose address range the transaction lies (fields [14:12]).

This register also contains a timeout error field [27] which is set when a timeout error occurs, and transaction is aborted. When the error occurs this register keeps the status latched unless it is cleared by writing 1 to clear field [29].

80.12.5 Timeout error

MTO register can be programmed with a timeout value above which the transaction should be aborted. When the transaction passes MDAD and FRAD level checks and QuadSPI is idle (no AHB transaction is ongoing, no DMA transfer is pending, RDBFL doesn't have any residue data from last transfer and (FR[TFF], FR[TBFF], FR[TBUF], FR[RBDF], FR[RBOF], FR[ABOF], FR[AIBSEF], FR[AITEF], , , FR[IPIEF], , FR[ILLINE], ,) interrupt is not pending) this counter is started. If the transaction is not completed before this timeout counter reaches the value programmed in MTO register the transaction is considered aborted by SFP and an error interrupt is generated if enabled. The error bit is also set in FLSEQREQ register along with the transaction details. After the timeout error, next transaction is written to QuadSPI register which was queued in another target group queue once SR[BUSY] flag goes low.

80.12.6 Arbitration lock

The arbitration lock feature is used to lock the arbitration for a particular queue. This lock can be requested by a master by writing '1' into IPCR[ARB_LOCK] field. Once the transaction passes both the checks (MDAD & FRAD) and wins the arbitration, this lock will be granted. After this, the transaction from the other queue will not be granted unless the arbitration is unlocked by previous queue. The master which locked the arbitration can unlock it by writing '1' to IPCR[ARB_UNLOCK] field. Once the transaction with unlock bit 1 passes the MDAD and FRAD checks, it will unlock the arbitration. After this transaction is finished, the other queue will be granted the arbitration which was waiting.

This arbitration lock feature can be used by software while doing any transaction to flash which may result in a waiting period. For example, in case of NOR flash, after a write is issued to flash there is a waiting period (TPP) for which the flash is inaccessible. In this case, the software should ensure that while writing this SEQID to IPCR register it should lock the arbitration so that transaction coming to other queue is not passed to flash controller which may result in failure. Once the software ensures that waiting period at flash is over, it can read the flash configuration/status registers to confirm. And after getting confirmation, it can send another read command to same configuration register with IPCR[ARB_UNLOCK] field set to '1'. This will ensure that the transaction waiting in another queue are granted. If the flash being used does not have a waiting period attached with transactions, then this ARB_LOCK field can be always kept to 0.

In case software uses this LOCK functionality RWW support will not be available. Because in this case, all the transaction from other queue which was blocked from arbitration will be blocked irrespective of read or write access. So, RWW support (read can go through even when flash is in waiting state) will not be available. The master which has arbitration lock granted can still send read accesses to flash during the waiting period in case the flash supports it.

80.12.7 Soft reset consideration with SFP

If there is any pending transaction in MDAD queue, do not assert QuadSPI reset bits unless you observe unexpected behavior like no response from the module. In that case, assert QSPI reset twice.

In case the soft reset is being used for QSPI, software should take some considerations so that correct functionality is maintained. if the soft reset is asserted when a transaction is being executed by SFP (FSM_STATE [1:0] bits are 01, 10 or 11) then this transaction will be aborted. Different conditions that can occur in case of soft reset are listed in table below:

Table 800. Soft reset conditions

Condition at time of soft reset	FSM state register at time of soft reset	Result	Timeout scenario
Some AHB transaction was ongoing and SFP/IPS is in waiting state.	FSM_STATE[1:0] = 00	After the soft reset if de-asserted the SFP will schedule its transaction over QSPI. FSM_STATE[1:0] will change to other values than 00. Software can fill TBDR in case it is a write transfer or start reading from RBDR.	In this case software doesn’t writes to TBDR or read from RBDR it will result in timeout error.

Table continues on the next page...

Table 800. Soft reset conditions (continued)

Condition at time of soft reset	FSM state register at time of soft reset	Result	Timeout scenario
QSPI was IDLE and SFP transaction has been arbitrated. TBDR is being filled and SFAR, IPCR are not currently written to QSPI.	FSM_STATE[1:0] = 01	Currently TBDR was being filled after soft reset all the entries in TBDR are flushed. So it is expected from software that it will start filling TBDR from start after the reset has de-asserted. SFP will write SFAR and IPCR to QSPI once its normal conditions are met (when number of available spaces in the TX buffer is greater than or equal to the value provided by TBCT[WMRK] or single TBDR write in case watermark check is disabled)	Timeout will occur if TBDR is not filled again after the soft reset is lifted.
SFP has written just SFAR to QSPI IPCR is not written yet. (For a read transfer or write transfer with data size 0)	FSM_STATE[1:0] = 01	After the soft reset is lifted the SFP will write ICPR to QSPI module and FSM_STATE will change to 11 (read) or 10(write). Transaction will finish normally.	Timeout conditions will be same as that for normal transfer.
SFP has written just SFAR to QSPI IPCR is not written yet. (Write data size is non 0)	FSM_STATE[1:0] = 01	After soft reset is lifted the SFP will write IPCR to QSPI module once software fill TBDR (from start) and FSM_STATE will change to 10.	Timeout conditions will be same as that for normal transfer.
SFP has written SFAR and IPCR to QSPI.	FSM_STATE[1:0] = 10 or 11	After the soft reset is de-asserted the current transaction will be deemed aborted. FSM_STATE valid will go low as transfer has finished.	No timeout.

So to conclude in case the soft reset is asserted when FSM_STATE[31] bit is 1 and state bits are 10 or 11 current transaction will be aborted & the next transaction will proceed as normal. In case the state bits are 00 or 11 then it is advisable that software doesn't writes into TBDR after the reset is de-asserted and waits for timeout error to be generated to know when current ongoing SFP transaction is aborted. After clearing the timeout error a new transaction can be launched to SFP or if already a new transaction is present in another queue it will be arbitrated.

80.12.8 Error Interrupt Enable

INT_EN register allow software to disable or enable the interrupt signal generation in case of any of the listed error conditions. This interrupt is generated on 'ipi_int_ored' interface signal of QuadSPI.

- Time out error (INT_EN[TO_ERR])
- IPCR register write error (INT_EN[TG*n*IPCR])
- SFAR register write error (INT_EN[TG*n*SFAR])
- IPS common error (INT_EN[IPS_ERR])
- FRAD access error (INT_EN[FRAD*n*ACC])
- No FRAD address range match error (INT_EN[FRADMTCH])

If the respective field is set to 1 for any of the error conditions, then the interrupt signal is set to 1 when that error occurs and it remains set until the error is cleared by writing 1 to error clear bit as listed in register descriptions.

80.13 Memory map and register definition

This section provides the memory map and register definitions for the QuadSPI module.

80.13.1 Register write access

Following are the write access restriction terms that apply to all the registers:

- Register write access restriction

  For each register field, the write access conditions are specified in the detailed register description.

  The following table provides a description of the write access conditions. If, for a specific register bit or field, none of the given write access conditions is fulfilled, any write attempt to this register bit or field is ignored without any notification. The values of the bits or fields are not changed.

  The condition term [A or B] indicates that the register or field can be written to if at least one of the conditions is fulfilled.

Table 801. Register write access restrictions

Condition	Description
Anytime	No write access restriction
Disabled mode	Write access only if MCR[MDIS] = 1
Normal mode	Write access only if the module is in the normal mode

- Register write access requirements

  You can access all registers using 8-bit, 16-bit, and 32-bit wide operations. For some of the registers, at least a 16-bit or 32-bit wide write access is required to ensure correct operation. This write access requirement is stated in the detailed register description for each affected register.

80.13.2 QuadSPI register descriptions

This section provides the memory map and register definitions for the QuadSPI module.

Access to the following addresses does not result in a transfer error:

- 50h
- 64h
- 120h
- 138h
- 168h
- 188h
- 18Ch

80.13.2.1 QuadSPI memory map

QuadSPI base address: 404C_C000h

Offset	Register	Width (In bits)	Access	Reset value
0h	Module Configuration Register (MCR)	32	RW	000F_404Ch
8h	IP Configuration Register (IPCR)	32	RW	0000_0000h
Ch	Flash Memory Configuration Register (FLSHCR)	32	RW	0000_0303h

80.13.2.2 Module Configuration Register (MCR)

Offset

Register	Offset
MCR	0h

Function

This register holds configuration data associated with the QuadSPI operation.

NOTE

When out of reset, after first initial MCR programming and exiting module disable mode (that is, when the value of MCR[MDIS] is 0), you must write 1 to MCR[SWRSTSD] and release it after six (three system and three flash memory) clock cycles.

Special write-access is permitted in different modes:

- DQS_FA_SEL: Disabled mode
- ISD3FA, ISD2FA: Disabled mode
- All other fields: Anytime

1 SWRSTHD	Software reset for AHB domain 0b - De-assert Software reset 1b - AHB domain flops are reset. This field does not reset configuration registers. It is advisable to reset both the serial flash memory domain and AHB domain at the same time. Resetting only one domain might lead to side effects. **NOTE** The software resets need the clock to be running to propagate to the design. The value of MCR[MDIS] should be 0 when the software reset bits are asserted. Also, before they can be deasserted again (by setting MCR[SWRSTHD] to 0), it is recommended to set the value of MCR[MDIS] to 1. After the software resets have been deasserted, the normal operation can be started by setting MCR[MDIS] to 0. **NOTE** Software must wait for at least three system cycles and three flash cycles after changing the value of this field.
0 SWRSTSD	Software reset for serial flash memory domain 0b - De-assert Software reset 1b - Serial flash memory domain flops are reset. This field does not reset configuration registers. It is advisable to reset both the serial flash memory domain and AHB domain at the same time. Resetting only one domain might lead to side effects.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	NOTE The software resets need the clock to be running to propagate to the design. The value of MCR[MDIS] should therefore be 0 when the software reset bits are asserted. Also, before they can be deasserted again (by specifying 0 as the value for MCR[SWRSTSD]), it is recommended to specify 1 as the value for MCR[MDIS]. After the software resets are deasserted, the normal operation can be started by specifying 0 as the value for MCR[MDIS]. **NOTE** Software must wait for at least three system cycles and three flash cycles after changing the value of this field.

80.13.2.3 IP Configuration Register (IPCR)

Offset

Register	Offset
IPCR	8h

Function

This register provides all the configuration required for an IP-initiated command, which can be triggered by writing in the SEQID field of this register. If the SEQID field is written successfully, a new command to the external serial flash memory is initiated per the sequence pointed to by this field. See Normal mode for details on command triggering and command execution.

Special write-access is permitted if:

- SR[IP_ACC]=0

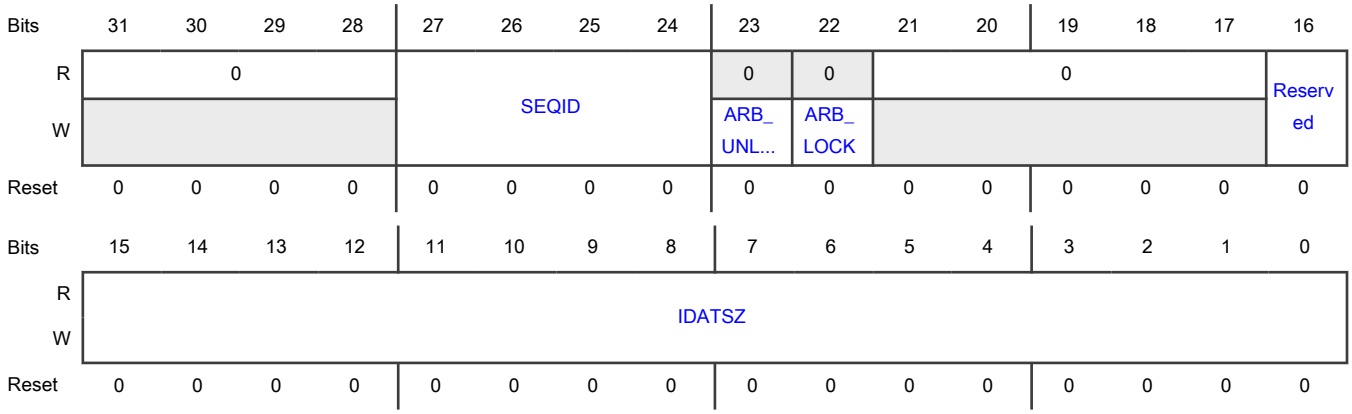
NOTE

Only one of the fields should be written '1' at a time out of ARB_LOCK and ARB_UNLOCK. If both the fields are written '1' at same time then it will invert the lock status. If the arbitration was already locked, it will unlock it and vice-versa.

NOTE

If MDAD and FRAD checks are enabled in MGC register but none of the MDAD and FRAD descriptors are valid, then any write on this register will generate a bus transfer error

Diagram



Fields

Field	Function
31-28 —	Reserved
27-24 SEQID	Points to a sequence in the LUT This field contains the sequence index of the LUT. See LUT for details. Each sequence index can accommodate up to 10 instructions (2 instructions per register). In case of read command, a write to this field triggers a transaction on the serial flash memory interface if QSPI SFM is IDLE. In case of write command, a write to this fields unlocks the TBDR access if QSPI SFM is not busy. Refer to section Secure flash protection for more details
23 ARB_UNLOCK	Arbitration Unlock Writing 1 to this bit unlocks the arbitration. Writing 0 will have no effect. The arbitration unlock will be done only if the transaction passes both MDAD and FRAD checks. To lock the arbitration write 1 to ARB_LOCK bit. This bit is always read as 0.
22 ARB_LOCK	Arbitration Lock Writing 1 to this bit locks the arbitration for that specific target queue. Writing 0 will have no effect. The arbitration lock will be granted only if the transaction passes both MDAD and FRAD checks. To unlock the arbitration write 1 to ARB_UNLOCK bit. This bit is always read as 0.
21-17 —	Reserved
16 —	Reserved
15-0 IDATSZ	IP data transfer size This field defines the data transfer size, in bytes, of the IP command.

80.13.2.4 Flash Memory Configuration Register (FLSHCR)

Offset

Register	Offset
FLSHCR	Ch

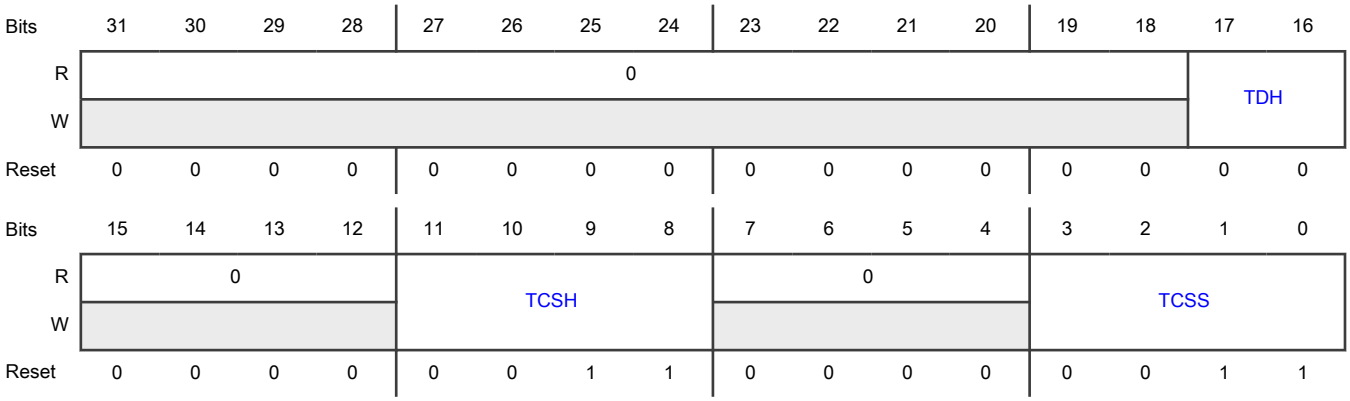
Function

This register contains the timings that are specific to the flash memory device. The QuadSPI controller must meet these timings for the device to function correctly.

Special write-access is permitted if:

- SR[AHB_ACC] = 0
- SR[IP_ACC] = 0

Diagram



Fields

Field	Function
31-18 —	Reserved
17-16 TDH	Serial flash memory data in hold time This field helps in meeting the data in hold time requirement of a flash memory. It is valid only in the DDR mode. **NOTE** This field should be set to 0x00 in the SDR mode (MCR[DDR_EN]=0). See Data input hold requirement of flash memory for details. The valid TDH programming options are shown below and the other combinations are invalid. 00b - Data aligned with the posedge of internal reference clock of QuadSPI 01b - Data aligned with 2x serial flash memory half clock

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-12 —	Reserved
11-8 TCSH	Serial flash memory CS hold time This hold time is in terms of serial flash memory clock cycles, and it must be greater than or equal to two flash memory clock cycles . Refer the chip datasheet for the exact value.
7-4 —	Reserved
3-0 TCSS	Serial flash memory CS setup time This setup time is in terms of serial flash memory clock cycles, and it must be greater than or equal to two flash memory clock cycles. Refer the chip Datasheet for the exact value.

80.13.2.5 Buffer 0 Configuration Register (BUF0CR)

Offset

Register	Offset
BUF0CR	10h

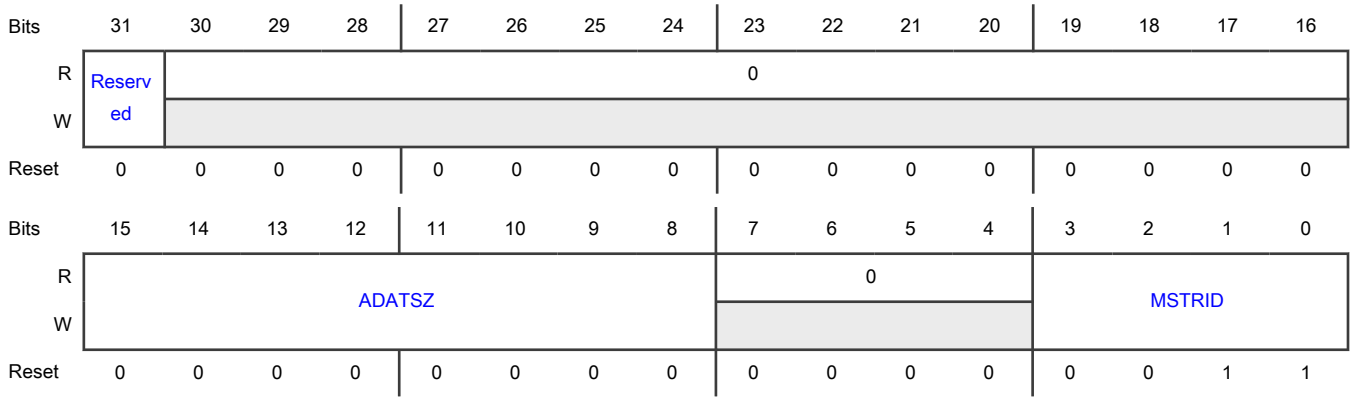
Function

This register provides the configuration for any read access routed to buffer0, which happens when the master ID of the incoming AHB request matches BUF0CR[MSTRID]. Any buffer "miss" leads to a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31 —	Reserved
30-16 —	Reserved
15-8 ADATSZ	AHB data transfer size Defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. For example, a value of 0x2 sets transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. The software should ensure that this transfer size is not greater than the size of the buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 0 Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

80.13.2.6 Buffer 1 Configuration Register (BUF1CR)

Offset

Register	Offset
BUF1CR	14h

Function

This register provides the configuration for any access routed to buffer 1, which happens when the master ID of the incoming AHB request matches the MSTRID field of this register. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram

Fields

Field	Function
31-16 —	Reserved
15-8 ADATSZ	AHB data transfer size This field defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. For example, a value of 0x2 sets the transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. Software should ensure that this transfer size is not greater than the size of this buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 1 Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

80.13.2.7 Buffer 2 Configuration Register (BUF2CR)

Offset

Register	Offset
BUF2CR	18h

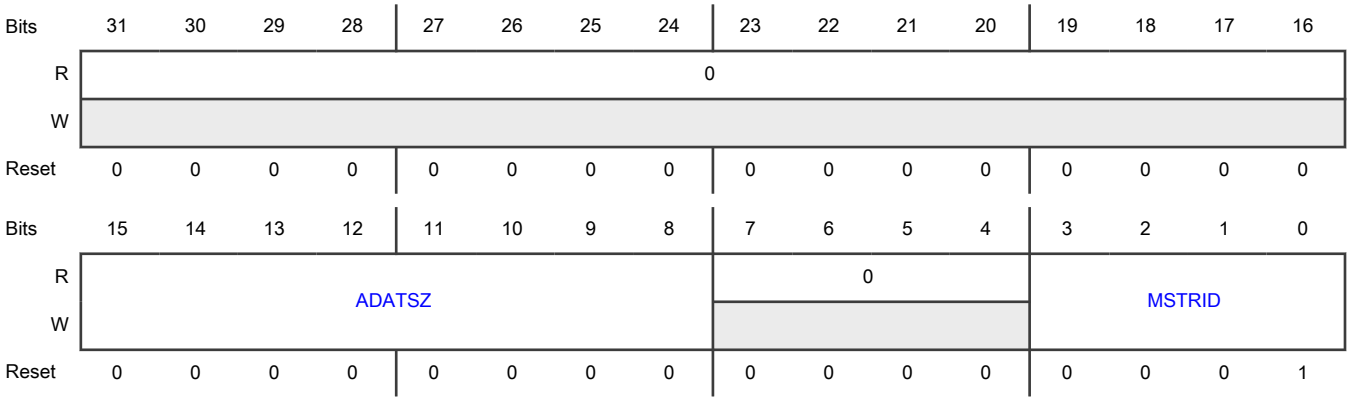
Function

This register provides the configuration for any access routed to buffer 2, which happens when the master ID of the incoming AHB request matches the MSTRID field of this register. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-16 —	Reserved
15-8 ADATSZ	AHB data transfer size This field defines the read data transfer size in 8 bytes of an AHB triggered read access to the serial flash memory. For example, a value of 0x2 sets transfer size to 16 bytes. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value. The software should ensure that this transfer size is not greater than the size of this buffer.
7-4 —	Reserved
3-0 MSTRID	Master ID The ID of the AHB master associated with BUFFER2. Any AHB read access with this master ID is routed to this buffer. It must be ensured that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

80.13.2.8 Buffer 3 Configuration Register (BUF3CR)

Offset

Register	Offset
BUF3CR	1Ch

Function

This register provides the configuration for any access to buffer 3.

An access is routed to buffer 3 when the master ID of the incoming AHB request matches the MSTRID field of BUF3CR. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by BFGENCR[SEQID].

In case the value of the ALLMST field is not 1, any such transaction (where master ID does not match any of the MSTRID fields) is returned with an ERROR response.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram

Fields

Field	Function
31 ALLMST	All master enable When set, buffer3 acts as an all-master buffer. Any AHB access with a master ID not matching with the master ID of buffer0, buffer1, or buffer2 is routed to buffer3. When set, the MSTRID field of this register is ignored.
30-18 —	Reserved
17-16 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-8 ADATSZ	AHB data transfer size Defines the read data transfer size in 8 bytes of an AHB triggered read access to serial flash memory. When ADATSZ = 0, the data size mentioned in the sequence pointed to by the SEQID field overrides this value.
7-4 —	Reserved
3-0 MSTRID	Master ID ID of the AHB master associated with BUFFER 3. Any AHB read access with this master ID is routed to this buffer. You must ensure that the master IDs associated with all buffers are different. **NOTE** See the chip-specific QuadSPI information for details about master IDs and their corresponding components.

80.13.2.9 Buffer Generic Configuration Register (BFGENCR)

Offset

Register	Offset
BFGENCR	20h

Function

This register provides generic configuration to any of the buffer accesses. Any buffer "miss" leads to the buffer being flushed and a serial flash memory transaction being triggered per the sequence pointed to by the SEQID field.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

This register is access controlled and can only be programmed by privilege masters. Write access is not permitted if MGC[11]=1b.

Diagram

15-12 SEQID	Points to a sequence in the LUT. This field contains the sequence index of the LUT... See LUT. **NOTE** If the sequence pointer differs in the new and the previous sequences, you should reset it. See sequence pointer clear register for more information.
11-0 —	Reserved

80.13.2.10 SOC Configuration Register (SOCCR)

Offset

Register	Offset
SOCCR	24h

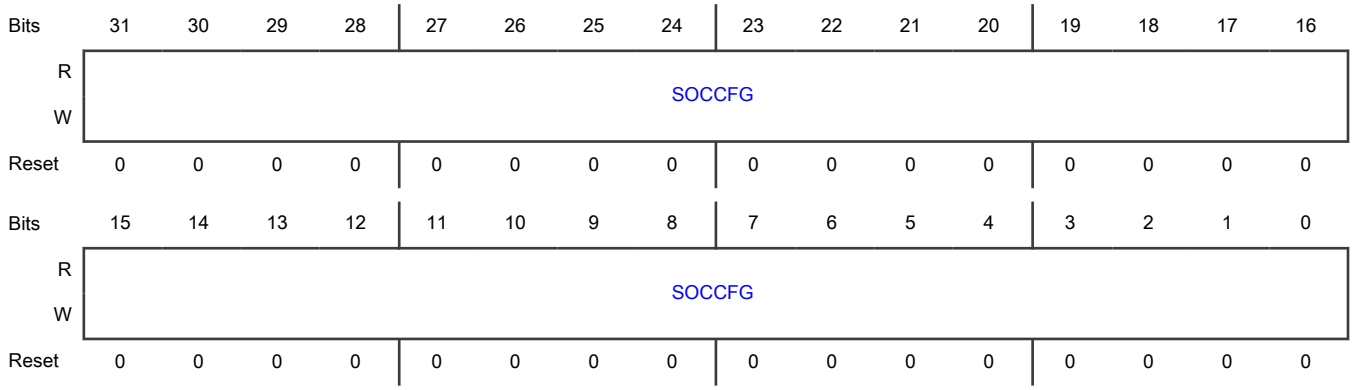
Function

This register is programmed at the chip level for QuadSPI configuration. For details, see chip-specific QuadSPI information.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-0 SOCCFG	SOC configuration This field configuration is specific to chip. For details, see chip-specific QuadSPI information.

80.13.2.11 Buffer 0 Top Index Register (BUF0IND)

Offset

Register	Offset
BUF0IND	30h

Function

This register specifies the top index for buffer 0, which defines its size. Note that the three LSBs of this register are set to 0. This ensures that the buffer is 64-bit aligned because each buffer entry is 64-bits long.

The register value should be set to the desired number of bytes. For example, setting BUF0IND[31:3] to 0 gives 0 bytes, setting the value to 1 gives 8 bytes, and so on.

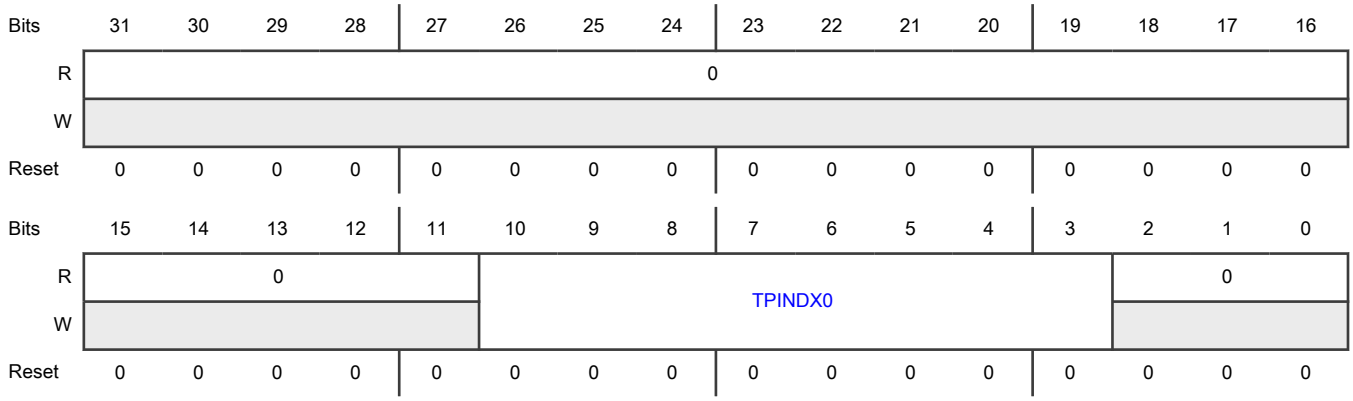
The size of buffer 0 is the difference between BUF0IND and 0.

The software must ensure that the value of TPINDX0 is not greater than the size of buffer 0.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-11 —	Reserved
10-3 TPINDX0	Top index of buffer 0
2-0 —	Reserved

80.13.2.12 Buffer 1 Top Index Register (BUF1IND)

Offset

Register	Offset
BUF1IND	34h

Function

This register specifies the top index of buffer 1, which defines its size. Note that the three LSBs of this register are set to 0. This ensures that the buffer is 64-bit aligned because each buffer entry is 64-bits long.

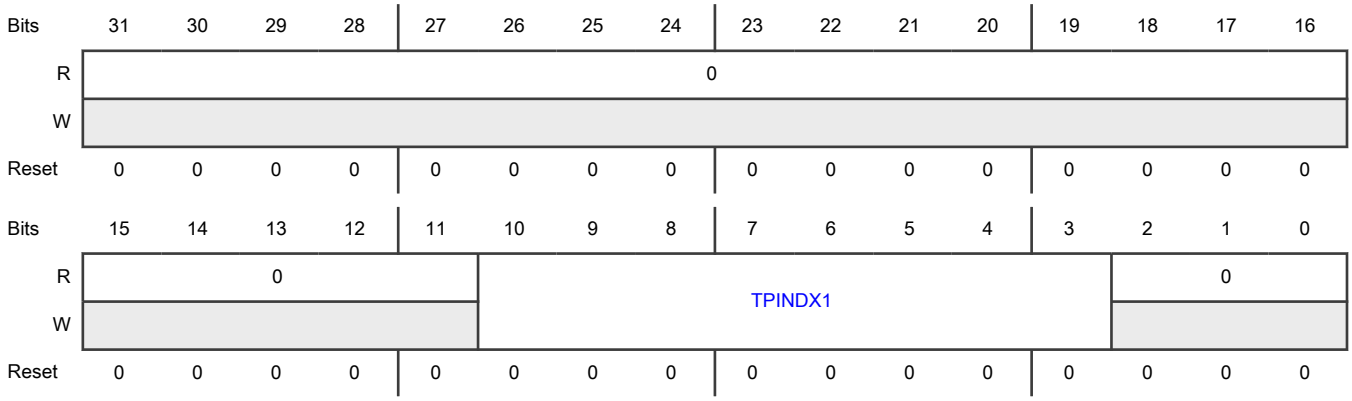
The size of buffer 1 is the difference between BUF1IND and BUF0IND. The register value should be entered in bytes. For example, if BUF0IND = 0x100, then setting BUF1IND = 0x130 sets the size of buffer 1 to 0x30 bytes.

The software must ensure that the value of TPINDX1 is not greater than the size of buffer 1.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-11 —	Reserved
10-3 TPINDX1	Top index of buffer 1
2-0 —	Reserved

80.13.2.13 Buffer 2 Top Index Register (BUF2IND)

Offset

Register	Offset
BUF2IND	38h

Function

This register specifies the top index of buffer 2, which defines its size. Note that the three LSBs of this register are set to 0. This ensures that the buffer is 64-bit aligned because each buffer entry is 64-bits long.

The size of buffer 2 is the difference between BUF2IND and BUF1IND. The register value should be entered in bytes. For example, if BUF1IND = 0x130 then setting BUF2IND = 0x180 sets the size of buffer 2 to 0x50 bytes.

The software must ensure that the value of TPINDX2 is not greater than the size of buffer 2.

Special write-access is permitted if:

- SR[AHB_ACC] = 0

80.13.2.14 DLL Flash Memory A Configuration Register (DLLCRA)

Offset

Register	Offset
DLLCRA	60h

Function

This register configures DLL and slave delay chain for flash memory A.

The value of the DLLEN field must be 1 after all reference (FREQEN, DLL_REFCNTR, DLLRES, SLAVE_AUTO_UPDT) delay chain configurations are programmed.

See DLL and delay chain usage for the programming sequence.

NOTE

See the chip data sheet for information on programming register fields.

NOTE

Please see the chip specific section of QuadSPI DLLCRA register for delay elements data

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31 DLLEN	DLL enable 0b - DLL reference logic remains in reset and should be 0 for at least three flash memory clock cycles for reset. 1b - Enables DLL logic. Set it to 1 after all the configuration for DLLCR reference settings is complete.
30 FREQEN	Frequency enable 0b - Selects delay chain for low frequency of operation 1b - Selects delay chain for high frequency of operation
29-28 —	Reserved
27-24 DLL_REFCNTR	DLL reference counter Select the "n+1" interval of DLL phase detection and reference delay updating interval (minimum recommended value = 1).
23-20 DLLRES	DLL resolution Minimum resolution for DLL phase detector to remain locked/unlocked based on flash memory clock jitter. The minimum value is 2, and should be programmed to a more suitable value, such as 6.
19-16 SLV_FINE_OFFSET	Fine offset delay elements in incoming DQS This field sets the number of fine offset delay elements up to 16 in incoming DQS, and the default must be 1 element.
15 —	Reserved
14-12	T/16 offset delay elements in incoming DQS This field sets the number of T/16 offset delay elements in incoming DQS; default is 0.

Table continues on the next page...

Table continued from the previous page...

Field	Function
SLV_DLY_OFFSET	
11-8 SLV_DLY_COARSE	Delay elements in each delay tap This field sets the number of delay elements in each delay tap. The field is used to overwrite DLL-generated delay values and works when the value of SLV_DLL_BYPASS is 1. Note : Please refer to the QuadSPI datasheet for more details.
7-5 —	Reserved
4 DLL_CDL8	DLL CDL8 Enable 0b - DLL is implemented to support within 2x variation 1b - DLL is implemented to support within 3x variation (BCS -> WCS)
3 SLAVE_AUTO_UPDT	Slave chain update This field automatically updates the slave chain as soon as DLL is locked. 0b - Auto-update feature is disabled. 1b - Auto-update feature is enabled.
2 SLV_EN	Slave enable 0b - DLL slave logic remains in reset, and its value should be 0 for at least three flash memory clock cycles for reset. 1b - Enables DQS slave delay chain, and should be 1 before any slave configuration settings take place.
1 SLV_DLL_BYPASS	Slave DLL bypass This field enables selection of the number of delays in each slave delay tap. 0b - Disables manual selection of coarse delays in the slave delay chain. 1b - Enables selection of number of delays in each slave delay tap, based on DLLCRA[SLV_DLY_COARSE].
0 SLV_UPD	Slave update You must program this field only after slave delay chain configuration takes place. 0b - Disables any further update on DQS slave delay chain. 1b - Updates the DQS slave delay chain with either ref-delay or bypass slave delay value, and should be set in the absence of the DQS clock.

80.13.2.15 Serial Flash Memory Address Register (SFAR)

Offset

Register	Offset
SFAR	100h

Function

The module automatically translates this address on the memory map to the address on the flash memory. When operating in a 24-bit mode, only bits 23-0 are sent to the flash memory. In the 32-bit mode, bits 27-0 are used with bits 31-28 driven to 0 when the value of SFACR[CAS] is 0. For example, if the value of SFACR[CAS] is 3, then bits 26-3 are sent to the flash memory as its page address in case flash memory is operating in a 24-bit mode. The total number of address bits requested by the flash memory, as its page and column address, must not be more than 32 bits. See Table 803 for the mapping between the access mode and the SFAR content and Normal mode for details on command triggering and command execution. The software must ensure that the serial flash memory address provided in the SFAR register lies in the valid flash memory address range, as defined in Table 803.

Special write-access is permitted if:

- SR[IP_ACC] = 0

NOTE

If MDAD and FRAD checks are enabled in MGC register but none of the MDAD and FRAD descriptors are valid, then any write on this register will generate a bus transfer error

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Fields

Field	Function
31-0 SFADR	Serial flash memory address

80.13.2.16 Serial Flash Memory Address Configuration Register (SFACR)

Offset

Register	Offset
SFACR	104h

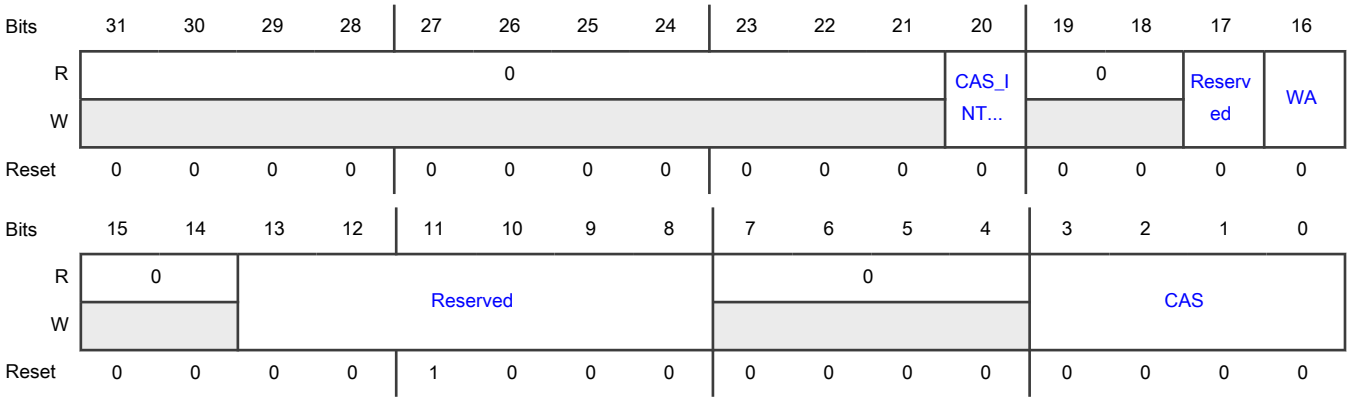
Function

This register contains the address requirements that are specific to serial flash memory. These requirements must be configured according to the connected flash memory, for the controller to function properly. The module automatically translates the address of SFAR on the memory map or the incoming address on the AHB bus to the column address on the flash memory. For example, if a flash memory needs 3 bits as its column address, then only the lower three bits of the SFAR/AHB address are sent to the flash memory as its column address. The software should ensure that the serial flash memory address provided in SFAR or the incoming AHB address lies in the valid flash memory address range.

Special write-access is permitted if:

- SR[IP_ACC] = 0
- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function

19-18 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
17 —	Reserved
16 WA	Word addressable Defines whether the serial flash memory is a byte addressable flash memory or a word addressable flash memory. According to the configuration of this field, the address is remapped to the flash memory interface. See Address scheme for details. 0b - Byte addressable serial flash memory mode 1b - Word (2-byte) addressable serial flash memory mode
15-14 —	Reserved
13-8 —	Reserved
7-4 —	Reserved
3-0 CAS	Column address space Defines the width of the column address. If the column address is, for example, [2:0] of SFAR/AHB address, then CAS must be 3. If there is no column address separation in any serial flash memory, the value of this field must be specified as 0.

80.13.2.17 Sampling Register (SMPR)

Offset

Register	Offset
SMPR	108h

Function

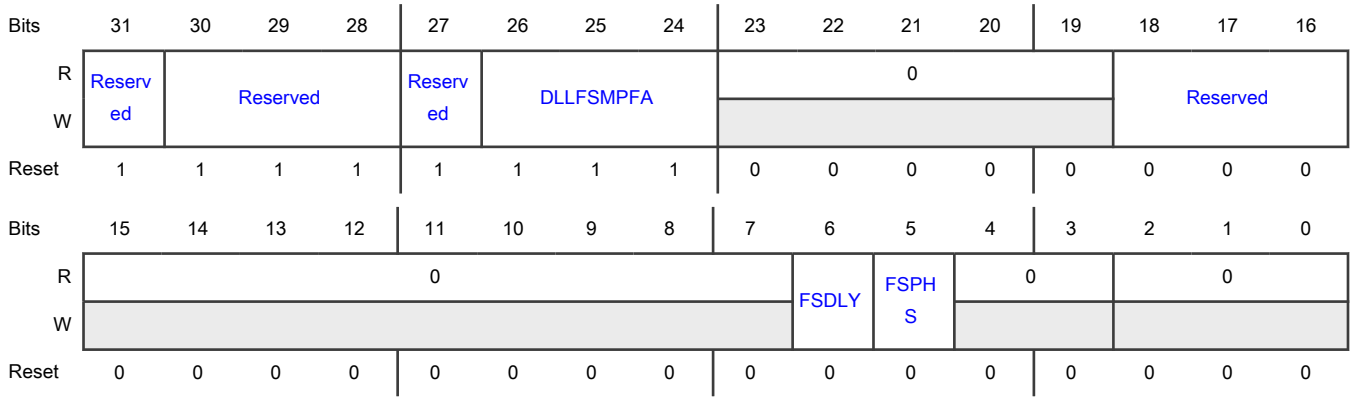
This register allows configuration of how the incoming data from the external serial flash memory devices is sampled in the QuadSPI module.

NOTE

See the chip data sheet for programming the register fields.

Special write-access is permitted in the disabled mode.

Diagram



Fields

Field	Function
31 —	Reserved
30-28 —	Reserved
27 —	Reserved
26-24 DLLFSMPFA	Selects the nth tap provided by slave delay chain for flash memory A The value of *n* can vary from 0 to 7, with each tap delay based on the DLLCRA register.
23-19 —	Reserved
18-16 —	Reserved
15-7 —	Reserved
6 FSDLY	Full-speed delay selection for internal/pad loop back DQS sampling This field selects the delay in accordance with the reference edge for the valid sample point. 0b - Same DQS 1b - Half-cycle early DQS
5 FSPHS	Full-speed phase selection for SDR instructions This field selects the edge of the sampling clock valid for full-speed commands. 0b - Select sampling at non-inverted clock

Table continues on the next page...

Table continued from the previous page...

80.13.2.18 RX Buffer Status Register (RBSR)

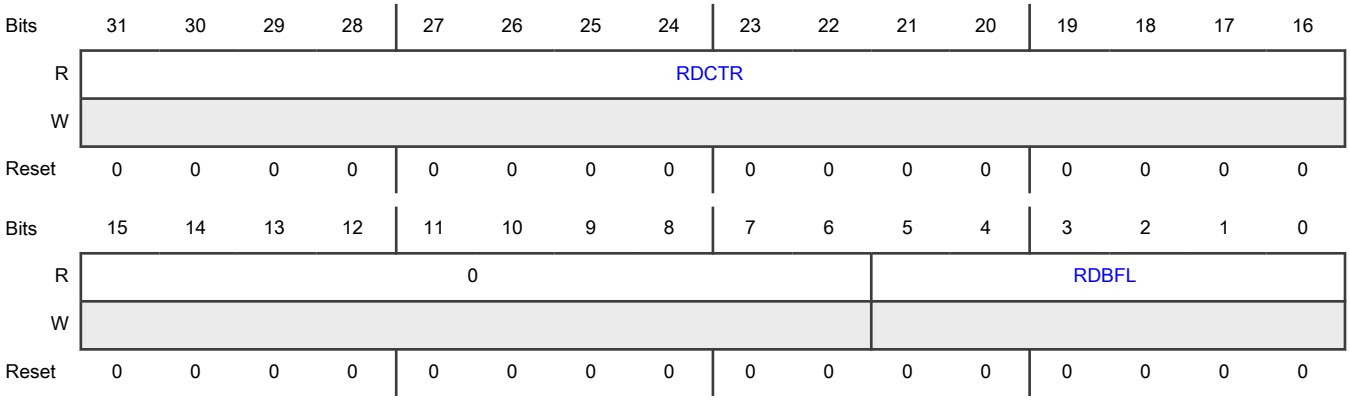
Offset

Register	Offset
RBSR	10Ch

Function

This register contains information related to the receive data buffer.

Diagram



Fields

Field	Function
31-16 RDCTR	Read counter Indicates the number of 4-byte entries removed from the RX buffer. For example, a value of 0x2 indicates that 8 bytes have been removed. It is incremented by the number (RBCT[WMRK] + 1) on RX buffer POP event. The RX buffer can be popped using DMA or FR[RBDF]. The RSER[RBDDE] defines which pop should be pursued. For details, see AHB RX Data Buffer Register (ARDB0 - ARDB31) and Data Transfer from the QuadSPI Module Internal Buffers.

Table continues on the next page...

Table continued from the previous page...

Field	Function
15-6 —	Reserved
5-0 RDBFL	RX buffer fill level Indicates the number of 4-byte entries available in the RX buffer. For example, a value of 0x2 indicates 8 bytes are available.

80.13.2.19 RX Buffer Control Register (RBCT)

Offset

Register	Offset
RBCT	110h

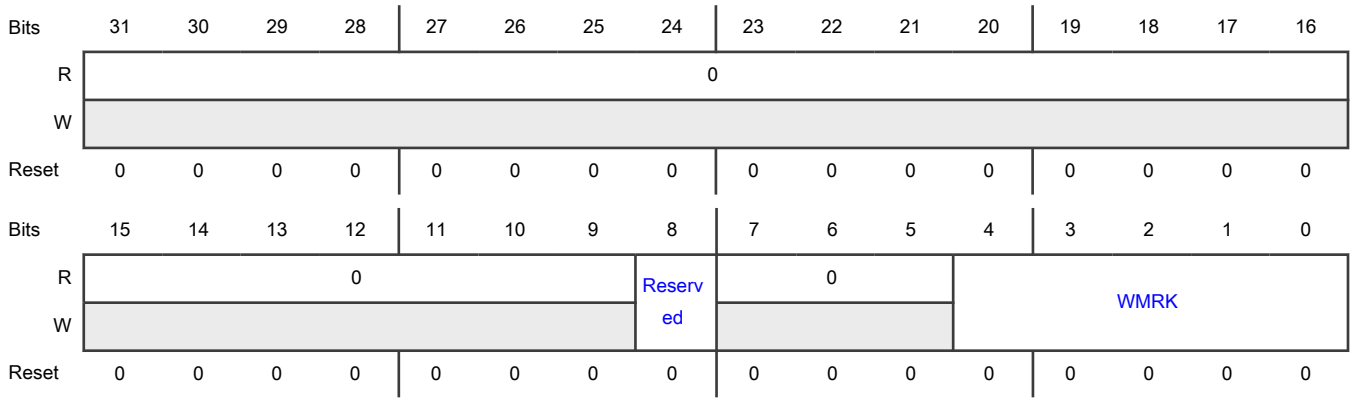
Function

This register contains control data related to the receive data buffer.

Special write-access is permitted if:

- SR[IP_ACC] = 0

Diagram



Fields

Field	Function
31-9 —	Reserved
8	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
7-5 —	Reserved
4-0 WMRK	RX buffer watermark This field determines when the readout action of the RX buffer is triggered. When the number of valid entries in the RX buffer is equal to or greater than the number provided by (WMRK+1), the SR[RXWE] flag is asserted. The value should be entered as the number of 4-byte entries minus 1. For example, a value of 0x0 sets the watermark to 4 bytes, 1 to 8bytes, 2 to 12 bytes, and so on. For details, see DMA usage. **NOTE** This field should never be programmed above 31 because there are only 32 memory mapped RBDR registers. If watermark is programmed above 31, data above 32 words will be lost.

80.13.2.20 DLL Status Register (DLLSR)

Offset

Register	Offset
DLLSR	12Ch

Function

Diagram

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								TRBFL							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-16 TRCTR	Transmit counter This field indicates how many entries of 4 bytes have been written into the TX buffer by host accesses. It is reset to 0 when a 1 is written to MCR[CLR_TXF]. It is incremented on each write access to the TBDR register when another word has been pushed onto the TX buffer. When it is not cleared, the TRCTR field wraps around to 0. See TX Buffer Data Register (TBDR) for details.
15-9 —	Reserved
8-0 TRBFL	TX buffer fill level This field contains the number of entries of 4 bytes each available in the TX buffer for the QuadSPI module to transmit to the serial flash memory device. The value of this field can reach maximum up to the total TX buffer size.

80.13.2.23 TX Buffer Data Register (TBDR)

Offset

Register	Offset
TBDR	154h

Function

This register provides access to the circular TX buffer of depth 256, so the total size is 256 * 4 bytes. This buffer provides the data written into it as write data for the page programming commands to the serial flash memory device. See Table 776 for the byte ordering scheme. A write transaction on the flash memory with data size of less than 32 bits leads to the removal of one data entry from the TX buffer. The valid bits are used and the rest of the bits are discarded.

Special write-access is permitted if:

- SR[TXFULL] = 0

NOTE

This register can only be written when write access is granted by SFP block else bus transfer error is generated on write. Please refer to section TBDR register write lock

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	TXDATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	TXDATA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31-0 TXDATA	TX data On write access, the data is written to the next available entry of the TX buffer and TBSR[TRBFL] is updated accordingly. On a read access, the last data written to the register is returned.

80.13.2.24 TX Buffer Control Register (TBCT)

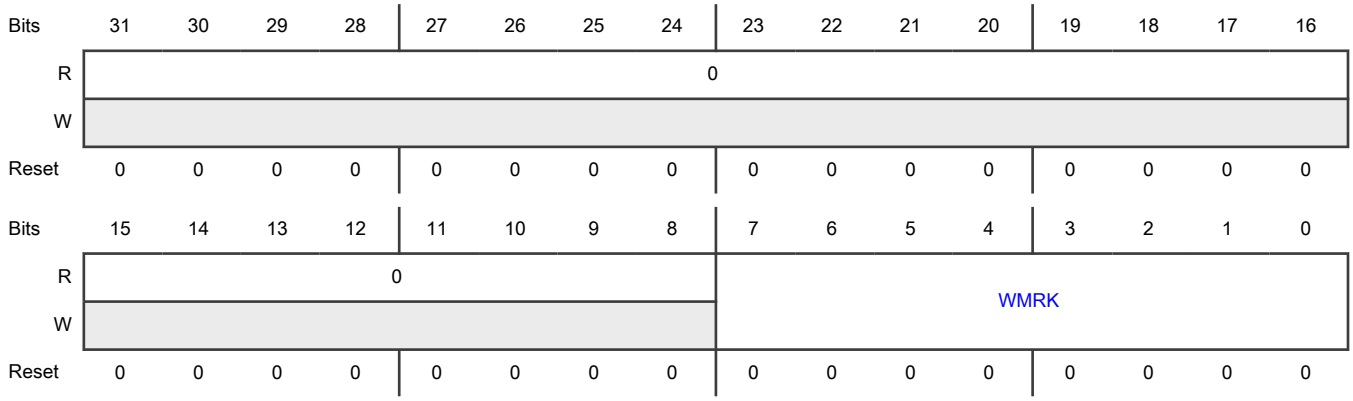
Offset

Register	Offset
TBCT	158h

Function

This register contains control information for transmit data buffer.

Diagram



Fields

Field	Function
31-8 —	Reserved
7-0 WMRK	Watermark for TX buffer Determines the watermark for the TX buffer When the number of available space in the TX buffer is greater than or equal to the number provided by WMRK (number of 4-byte entries), SR[TXWA] is asserted. For example, a value of 0x1 sets the watermark to 4 bytes, 0x2 sets it to 8 bytes, 0x3 sets it to 12 bytes, and so on. For details, see DMA usage. WMRK = 0 is invalid. **NOTE** For IPS write with SFP enabled, this field must be programmed as per formula to prevent TX underflow: If data size in words >1, watermark=(TX FIFO size in words - data size in words) +1, If data size in words =1, watermark=(TX FIFO size in words - data size in words)

80.13.2.25 Status Register (SR)

Offset

Register	Offset
SR	15Ch

Function

This register provides all the available status information about SFM command execution and arbitration, the RX buffer, TX buffer, and the AHB buffer.

Diagram

2 AHB_ACC	AHB read access Asserted when the currently executed transaction is initiated by the AHB bus
1 IP_ACC	IP access Asserted when transaction currently executed is initiated by the IP bus
0 BUSY	Module busy Asserted when module is currently busy handling a transaction to an external flash memory device

80.13.2.26 Flag Register (FR)

Offset

Register	Offset
FR	160h

Function

This register provides all available flags about SFM command execution and arbitration, which may serve as the source for the generation of interrupt service requests. Note that the error flags in this register do not relate directly to the execution of the transaction in the serial flash memory device itself but only to the behavior and conditions visible in the QuadSPI module.

Special write-access is permitted in the enabled mode.

29 —	Reserved
28 DLLABRT	DLL abort 1b - This field is set whenever DLL is unlocked while reading data from the flash memory.
27 TBFF	TX buffer fill flag Before writing to the TX buffer, this field should be cleared. Then, it should be read back. If it is set, the TX buffer can include more data. If the field remains cleared, the TX buffer can be considered as full. See TX buffer operation for details.
26 TBUF	TX buffer underrun flag This field is set if the module tries to pull data when the TX buffer is empty.. The IP command leading to the TX buffer underrun is continued (data sent to the serial flash memory device is undefined). Here, a valid underrun means that it should have occurred during the transaction so that few bytes (that is, less than 4 bytes) are left in FIFO and the remaining are filled with "FFFFh". This field does not set if transfer is less than 128 bits. The application must clear the TX buffer in response to this event by writing a 1 to MCR[CLR_TXF]. The application must clear the TX buffer in response to this event by writing a 1 to MCR[CLR_TXF].
25 —	Reserved
24 DLLUNLCK	DLL unlock 1b - This field is set whenever DLL unlock event occurs, irrespective of flash memory access.
23 ILLINE	Illegal instruction error flag This field is set when an illegal instruction is encountered by the controller in any of the sequences. As soon as the field is set, you must assert MCR[SWRSTSD] and MCR[SWRSTHD]. That is, reset the flash memory and AHB domain after reconfiguring the correct sequence instruction. See Table 774 for a list of legal instructions.
22-21 —	Reserved
20 —	Reserved
19-18	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
—	
17 RBOF	RX buffer overflow flag This field is set when no more data can be pushed into the RX buffer from the serial flash memory device. The IP command leading to this condition is continued until the number of bytes in IPCR[IDATSZ] are read from the serial flash memory device. The content of the RX buffer remains unchanged.
16 RBDF	RX buffer drain flag This field is set if SR[RXWE] is asserted. Writing 1 to this field triggers one of the following actions: • If the RX buffer has up to RBCT[WMRK] valid entries, then the flag is cleared. • If the RX buffer has more than RBCT[WMRK] valid entries and the RSER[RBDDE] field is not set (flag driven mode), an RX buffer POP event is triggered. The flag remains set if the RX buffer contains more than RBCT[WMRK] valid entries after the RX buffer POP event is complete. The flag is cleared if the RX buffer contains less than or equal to RBCT[WMRK] valid entries after the RX buffer POP event is complete. See the "Receive Buffer Drain Interrupt or DMA Request" section in Normal mode interrupt and DMA requests for details.
15 —	Reserved
14 AITEF	AHB illegal transaction error flag This is set whenever there is no response generated from QuadSPI to AHB bus in case of an illegal transaction and the watchdog timer expires. The timer value is considered as a parameter.
13 AIBSEF	AHB illegal burst size error flag This is set whenever the total burst size (size x beat) of an AHB transaction is greater than the prefetch data size, which is defined by BUFxCR[ADATSZ] or data size mentioned in the sequence pointed to by the SEQID field in case ADATSZ = 0. See HBURST support with AHB read details on HBURST feature.
12 ABOF	AHB buffer overflow flag This is set when the size of the AHB access exceeds the size of the AHB buffer. This condition can occur only if BUFxCR[ADATSZ] is programmed incorrectly. The AHB command leading to this condition is continued until the number of entries according to BUFxCR[ADATSZ] have been read from the serial flash memory device. The content of the AHB buffer is not changed.
11 —	Reserved
10	Sets when there is CRC or ECC error for flash memory A

CRCAEF	0b - CRCEF interrupt is not generated. 1b - CRCEF interrupt is generated.
9 —	Reserved
8 —	Reserved
7 —	Reserved
6 IPIEF	IP command trigger could not be executed error flag This is set when the SR[IP_ACC] and SR[AWRACC] fields are set (that is, an IP triggered command is currently executing) and any of the following conditions occurs: • Write access to the RBCT
5 —	Reserved
4 —	Reserved
3-1 —	Reserved
0 TFF	IP command transaction finished flag This field is set after the QuadSPI module completes a running IP command. If an error occurs, and the related error flags are valid in the same clock cycle, the TFF flag is asserted.

80.13.2.27 Interrupt and DMA Request Select and Enable Register (RSER)

Offset

Register	Offset
RSER	164h

Function

This register provides enables and selectors for the interrupts in the QuadSPI module.

NOTE

Each field of the FR enabled as source for an interrupt prevents the QuadSPI module from entering the Stop mode or Module Disable mode when this flag is set.

Special write-access is permitted in the "Anytime" mode.

80.13.2.28 Sequence Pointer Clear Register (SPTRCLR)

Offset

Register	Offset
SPTRCLR	16Ch

Function

This register provides fields to reset the IP and buffer sequence pointers. The sequence pointer contains the index of instructions within the LUT entry that is to be executed next. For example, if the LUT entry ends on a JMP_ON_CS value of 2, the index is stored as 2.

The software should reset the sequence pointers defined by JMP_ON_CS operand whenever the sequence ID is required to be changed by updating the SEQID field in the IPCR or BFGENCR.

80.13.2.29 Serial Flash Memory A1 Top Address Register (SFA1AD)

Offset

Register	Offset
SFA1AD	180h

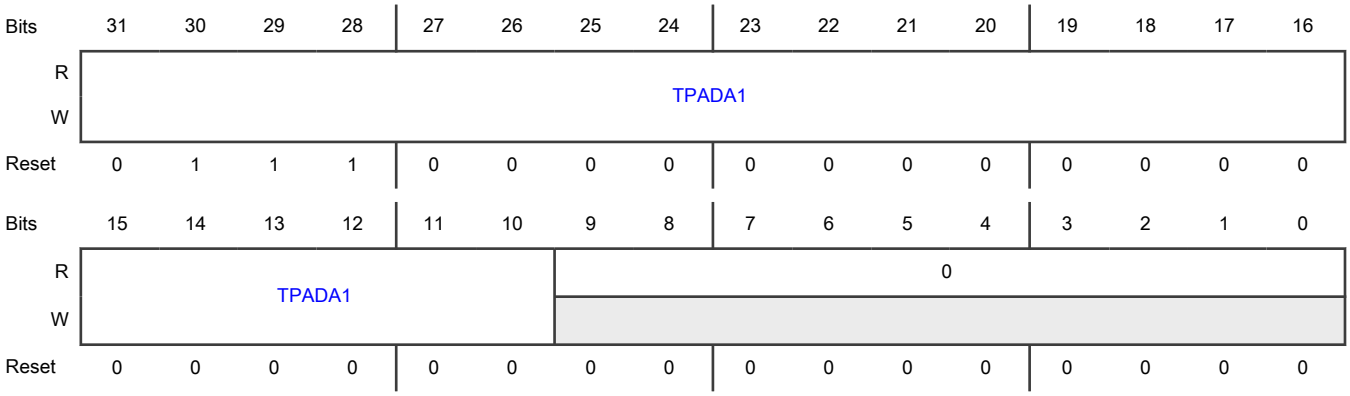
Function

This register provides the address mapping for serial flash memory A1. The difference between SFA1AD[TPADA1] and AMBA_BASE defines the size of the memory map for serial flash memory A1.

Special write-access is permitted if:

- SR[IP_ACC] = 0
- SR[AHB_ACC] = 0

Diagram



Fields

Field	Function
31-10 TPADA1	Top address for serial flash memory A1 In effect, TPADxx is the first location of the next memory.

80.13.2.31 RX Buffer Data Register (RBDR0 - RBDR31)

Offset

For a = 0 to 31:

Register	Offset
RBDRa	200h + (a × 4h)

Function

These registers provide access to individual entries in the RX buffer. See Table 776 for the byte ordering scheme.

RBDR0 corresponds to the actual position of the read pointer within the RX buffer. The number of valid entries available depends on the number of RX buffer entries implemented and on the number of valid buffer entries available in the RX buffer.

Example 1 - RX buffer filled completely with 32 words: In this case, the address range for valid read access extends from RBDR0 to RBDR31 RBDR63.

Example 2 - RX buffer filled with five valid words: RX buffer fill level of RBSR[RDBFL] is 5. In this case, access to RBDR4 provides the last valid entry.

Any access beyond the range of valid RX buffer entries provides undefined results.

80.13.2.33 LUT Lock Configuration Register (LCKCR)

Offset

Register	Offset
LCKCR	304h

Function

This register is used along with the LUTKEY register to lock or unlock the LUT. This register should be written immediately after the LUTKEY register for the lock or unlock operation to be successful. See LUT for details. Setting both the LOCK and UNLOCK bits as "00" or "11" is not allowed.

Special write access is permitted after writing the LUT key register. Write access is not permitted if MGC[11]=1b.

Table continued from the previous page...

Field	Function
	• This register is written just after the LUT Key Register (LUTKEY). • The LUT key register was written with the 0x5AF05AF0 key.
0 LOCK	Lock LUT Locks the LUT when the following conditions are met: • This register is written just after the LUT Key Register (LUTKEY). • The LUT key register is written with the 0x5AF05AF0 key.

80.13.2.34 LUT Register (LUT0)

Offset

Register	Offset
LUT0	310h

Function

A sequence of instruction-operand pairs may be pre-populated in the LUT according to the device connected on board. Each instruction-operand pair is of 16 bits (2 bytes) each. Every sequence preprogrammed by Program Sequence Engine in the LUT is referred to by its index. The LUT registers act as lookup tables for sequences of instructions. The programmable sequence engine executes the instructions in these sequences to generate a valid serial flash memory transaction. There are a total of 80 LUT registers. These 80 registers are divided into groups of 5 registers that make a valid sequence. Therefore, LUT[0], LUT[5], LUT[10] ..... LUT[75] are the starting registers of a valid sequence. Each of these sets of 5 registers can have a maximum of 10 instructions. Reset value of the register shown below is only applicable to LUT2 to LUT79. A maximum of 16 sequences can be defined at one time. See LUT that describes the LUT registers in detail.

Special write-access is permitted if the LUT is unlocked.

This register is access controlled and can only be programmed by privilege masters. Last six LUT SEQID locations should be used for programming SEQID for atomic commands (where flash's internal config region is accessed) like flash erase etc. where data transfer is not required. These 6 SEQID can be send to QSPI using only FRAD0 and can't be qualified using any other FRAD. For details, see Atomic commands considerations. Write access is not permitted if MGC[11]=1b.

This register is access controlled and can only be programmed by privilege masters.

Diagram

Fields

Field	Function
31 VLD	Valid This field indicates whether the FRAD Descriptor for a specific flash region is valid. This field can not be written in same cycle if EAL field is being written as 10 or 11. **NOTE** You must enable this field after programming FRAD0_WORD0, FRAD0_WORD1, FRAD0_WORD2 and FRAD0_WORD3 registers. 0b - FRAD-Assignment is invalid 1b - FRAD-Assignment is valid
30-29 LOCK	Descriptor Lock This field enables masking of accidental write on FRAD registers. Lock is enabled/disabled by Secure/Privileged master. Lock functionality does not affects the EAL bits of FRAD. They can still be written even if FRAD descriptors are locked. **NOTE** These bits are 'sticky' in nature. After each bit is written with 1, writing 0 has no effect. It remains 1 until after a hard reset. 00b-01b - Lock disabled. Descriptor registers can be written by any master 10b - Lock enabled. Descriptors are read-only. MDnACP fields can be programmed only by the master with ID matching the MID check of their respective Target group MDAD. If the Target group MDAD is not valid then MDnACP fields also become read-only. 11b - Lock enabled. Descriptor registers are read-only.
28-26 —	Reserved
25-24 EAL	Exclusive Access Lock This field provides exclusive write lock over a FRAD region based on MD*n*ACP.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	00b - No lock. Write permissions available for all masters based on their MDxACP evaluation. 01b - NA 10b - Lock enabled. Write permissions revoked for all domains. It can only be changed to 11b and can't directly be changed to 00b. 11b - Lock enabled. Exclusive write permission for master with master ID given in FRADn_WORD3[EALO] fields based on its MDxACP evaluation. Write disabled for other masters. Exclusive lock can be taken by a master only if it its ID matches the master ID check of any of the MDAD target queue, which is valid. MDxACP field corresponding to that target queue is not programmed as 0b. when a master writes 11b on this field it will be written only if above condition is met and then the master ID will be stored in FRADn_WORD3[EALO]. No transfer error will be generated in case the master does not satisfies the check.
23-0 —	Reserved

80.13.2.41 Flash Region Compare Address Status (FRAD0_WORD4 - FRAD7_WORD4)

Offset

For n = 0 to 7:

Register	Offset
FRADn_WORD4	810h + (n × 20h)

Function

This register is access controlled and can only be programmed by privilege masters.

NOTE

Any write access to these registers will result in bus transfer error

30 CMPVALID	Comparison Valid This field indicates the validity of flash region specific comparison check.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Access result/status not available 1b - Access result/status is available
29 CMP_ERR	Comparison Error This field indicates the error status (based on secure/privilege attributes checked with MDxACP permissions or exclusive access lock as programmed in FRAD) for flash region specific comparison check for last transaction. When this field is set, it can be cleared by writing '1' to W1C field of ERRSTAT register. It will update new value only after the error field has been cleared. 0b - No error 1b - Access error
28-8 —	Reserved
7 CMP_PA	Capture Privilege Attribute Capture Privilege attribute of last transaction which passed the address check for this FRAD. 0b - Non-privilege transaction 1b - Privilege transaction
6 CMP_SA	Capture Secure Attribute Capture Secure attribute of last transaction which passed the address check for this FRAD. 0b - Non-secure transaction 1b - Secure transaction
5-0 CMP_MDID	Capture MDID Value Capture master ID (MDID) value of the last transaction which passed the address check for this FRAD.

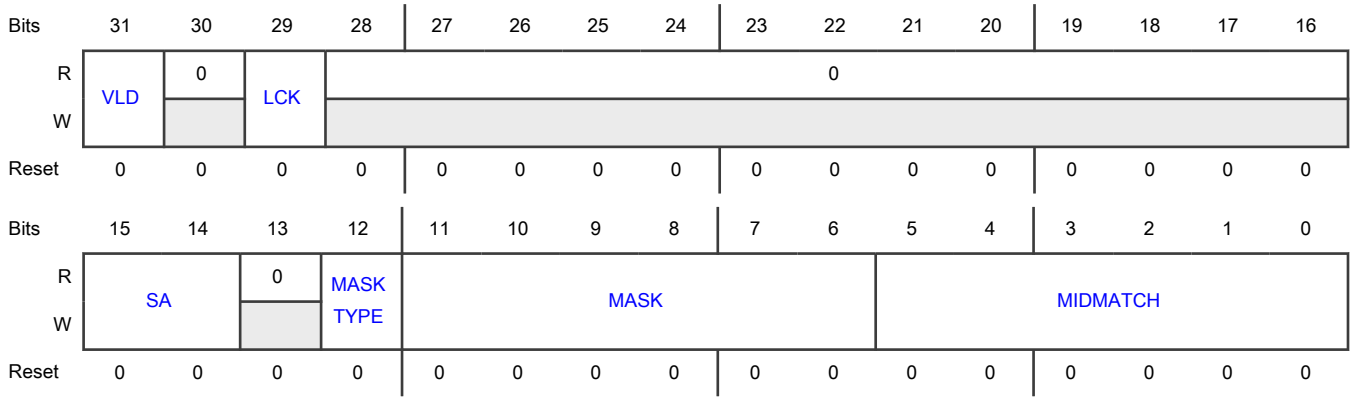
80.13.2.43 Target Group n Master Domain Access Descriptor (TG0MDAD - TG1MDAD)

Offset

Register	Offset
TG0MDAD	900h
TG1MDAD	910h

Function
This register is access controlled and can only be programmed by privilege masters.

Diagram



Fields

Field	Function
31 VLD	Valid Indicates whether MDAD Descriptor for the target group *n* is valid. 0b - MDAD-Assignment is invalid 1b - MDAD-Assignment is valid
30 —	Reserved
29 LCK	Descriptor Lock This field provides a means to make the MDAD descriptor read-only. **NOTE** This bit is 'sticky' in nature. After it is written with 1, writing 0 has no effect. It remains 1 until after a hard reset. 0b - Lock disabled. Registers can be written. 1b - Lock enabled. Registers are read-only.
28-16 —	Reserved
15-14 SA	Secure Attribute Defines the secure attribute selection criteria for entry into descriptor queue.. 00b - NA. This option should not be used. Allows the bus attribute for this master to non-secure only 01b - Allow the bus attribute for this master to non-secure only 10b - Allow the bus attribute for this master to secure only 11b - Allow the bus master's attribute: Both secure and non-secure

Table continues on the next page...

Table continued from the previous page...

Field	Function
13 —	Reserved
12 MASKTYPE	Mask Type 0b - ANDed mask 1b - ORed mask
11-6 MASK	Mask Defines the 6-bit mask value for the ID-Match comparison
5-0 MIDMATCH	Master ID Reference Specifies the reference value of the Master-ID (MID) for MID-comparison

80.13.2.44 Target Group n SFAR Address (TG0SFAR - TG1SFAR)

Offset

Register	Offset
TG0SFAR	904h
TG1SFAR	914h

Function
Flash memory start address of the transaction in this target group queue.

Diagram

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields

Field	Function
31 VLD	Valid Indicates whether the SFAR Address for the target group *n* is valid and queue is busy. This bit will not be set when ERR bit is set. 0b - SFAR-Assignment is invalid

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - SFAR-Assignment is valid
30 ERR	Error Indicates whether the SFAR address stored by a Master is with required access attributes for this target group descriptor. 0b - SFAR with required attributes 1b - SFAR without required attributes
29 CLR	Clear Clears the SFAR Status register. This register can only be cleared by the master having security attribute defined by TG*n*MDAD[SA]. After clearing if there is any valid transaction present in MDAD queue, it will again get updated in this register else it will be cleared. It will not be cleared if TGxMDAD[SA] bits are set to 00.
28-13 —	Reserved
12 PA	Privileged Attribute Privilege attribute of the master which wrote the SFAR register. 0b - Non-privileged 1b - Privileged
11 —	Reserved
10 SA	Secure Attribute Secure attribute of the master which wrote the SFAR register. 0b - Non-secure 1b - Secure
9-6 —	Reserved
5-0 TG_MID	Transaction Master ID Indicates the Master-ID of a transaction which programmed the SFAR registers with required attributes.

80.13.2.46 Target Group n IPCR Status (TG0IPCRS - TG1IPCRS)

Offset

Register	Offset
TG0IPCRS	90Ch
TG1IPCRS	91Ch

Function

Target group *n* IPCR status.

NOTE

This register can only be read if the master reading the register passes the security checks set in TGnMDAD[SA] fields or if MDAD descriptor is not valid. Else this register will be read as 0. It will also read as 0 if TGnMDAD[SA] bits in descriptor are set as 00.

Fields

Field	Function
31 VLD	Valid Indicates whether the IPCR-IDATZ, IPCR-SEQID and PAR stored in this target group queue is valid and queue is locked. This bit will not be set in case ERR is set. 0b - IPCR-assignment is invalid 1b - IPCR-assignment is valid and queue is locked.
30-29 ERR	Error Indicates whether the IPCR stored by a Master with required access attributes wrt target group MDAD 00b - IPCR programming with required attributes 01b - IPCR-DATZ programming without required attributes

Table continues on the next page...

Table continued from the previous page...

Field	Function
	10b - IPCR-SEQID programming without required attributes 11b - IPCR-DATZ and SEQID both programming without required attributes
28 CLR	Clear Clears the status in IPCR Status register. This register can only be cleared by the master having security attribute defined by TGnMDAD[SA]. After clearing if there is any valid transaction present in MDAD queue it will again get updated in this register else it will be cleared. It will not be cleared if TGxMDAD[SA] bits are set to 00.
27-23 —	Reserved
22 ARB_UNLOCK	Arbitration Unlock Specifies if the arbitration unlock is requested for TGn. 0b - No effect 1b - Arbitration unlock is requested
21 ARB_LOCK	Arbitration Lock Specifies if the arbitration lock is requested for TGn. 0b - No effect 1b - Arbitration lock is requested
20 PAR	Parallel Mode Enable Value Indicates the parallel mode enable value programmed in the target group queue.
19-16 SEQID	SEQID Value Indicates the SEQID value programmed in target group queue.
15-0 IDATSZ	IDATSZ Value Indicates the IDATSZ value programmed in target group queue.

80.13.2.47 Master Global Configuration (MGC)

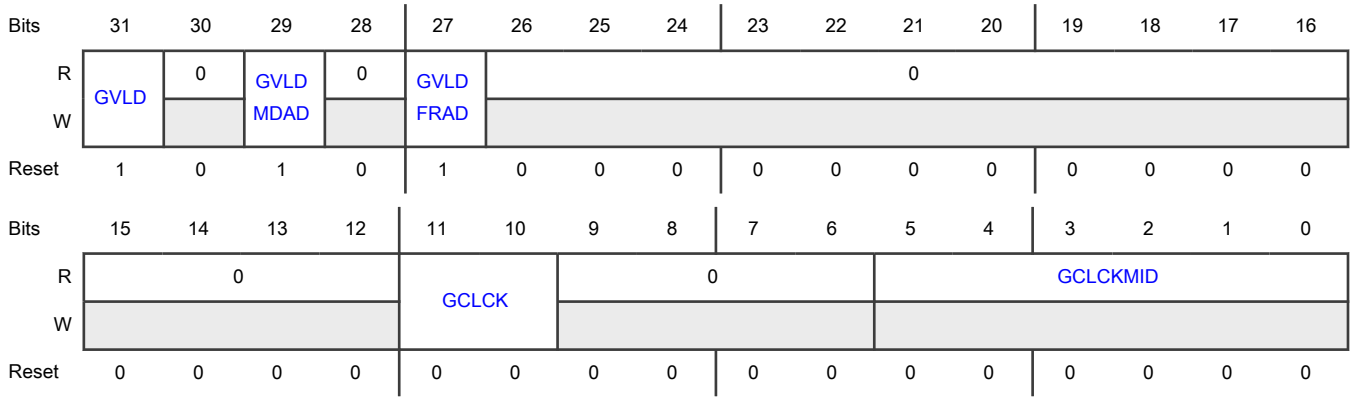
Offset

Register	Offset
MGC	920h

Function

This register is access controlled. It can only be programmed by master with master ID equal to 000011b. For MGC, MRC and MTO registers access checks master ID is being used. For transaction level checks inside MDAD and FRAD domain IDs are being used.

Diagram



Fields

Field	Function
31 GVLD	Global Valid access control 0b - Access controls are disabled. No descriptor comparison check. All transactions are allowed. 1b - Access controls are enabled.
30 —	Reserved
29 GVLDMDAD	Global Valid MDAD 0b - MDADs are disabled 1b - MDADs are enabled
28 —	Reserved
27 GVLDFRAD	Global Valid FRAD 0b - FRADs are disabled 1b - FRADs are enabled
26-12 —	Reserved
11-10 GCLCK	Global Configuration Lock This field provides a mechanism to limit write access to descriptors specific registers (MGC, MRC and MTO registers). If lock is enabled (MGC[11]=1b), this field also restricts write access to BFGENCR and LUT registers. 00b - Global Lock disabled. Registers can be written based on individual register access attribute. 01b - NA 10b - Lock enabled. Only the global configuration lock owner can write to the registers.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	11b - Lock enabled. All registers are read only until unlocked
9-6 —	Reserved
5-0 GCLCKMID	Global configuration Lock Owner Status This fields specifies the 6-bit Master-ID of Global configuration Lock owner (which set MGC[GCLCK]=10). Input value of Global Master-ID is provided by sideband signals.

80.13.2.48 Master Read Command (MRC)

Offset

Register	Offset
MRC	924h

Function

This register is access controlled. It can only be programmed by master with master ID equal to 000011b.

NOTE

In case of Sequence Auto Join instruction in LUT, SFP will parse only first sequence. Second sequence will not be parsed for checking Read commands.

Diagram

R	WRITE_TO															
W																
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Fields

Field	Function
31-0 WRITE_TO	Write Timeout Maximum timeout value to abort the ongoing write or read command. The timeout counter starts after the access from any target queue has won the arbitration and QSPI is IDLE (FSM_STAT state field is not 00). SFP queue is cleared once this timeout value has been reached and interrupt is generated if enabled.

80.13.2.50 FlashSeq Request (FLSEQREQ)

Offset

Register	Offset
FLSEQREQ	92Ch

Function

This register is access controlled and can only be programmed by privilege masters.

Diagram

15 —	Reserved
14-12 FRAD	Flash Region Descriptor Number Flash Region specific number (FRAD) of last executed FlashSeq request.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This will remain 0 in case of read transfers.
11 —	Reserved
10 ARB_LOCK	Arbitration Lock Arbitration lock status for last completed request. 0b - Arbitration was not locked 1b - Arbitration was locked
9 PA	Privilege Attribute Privilege attribute of last executed FlashSeq request. 0b - Non-privilege Transaction 1b - Privilege Transaction
8 SA	Secure Attribute Secure attribute of last executed FlashSeq request. 0b - Non-secure Transaction 1b - Secure Transaction
7 —	Reserved
6 REQ_TG	FlashSeq Request Target Group Target group queue from which last executed transaction passed. 0b - TG0 1b - TG1
5-0 REQ_MID	FlashSeq Request Master ID Indicates the master-ID of last executed FlashSeq request.

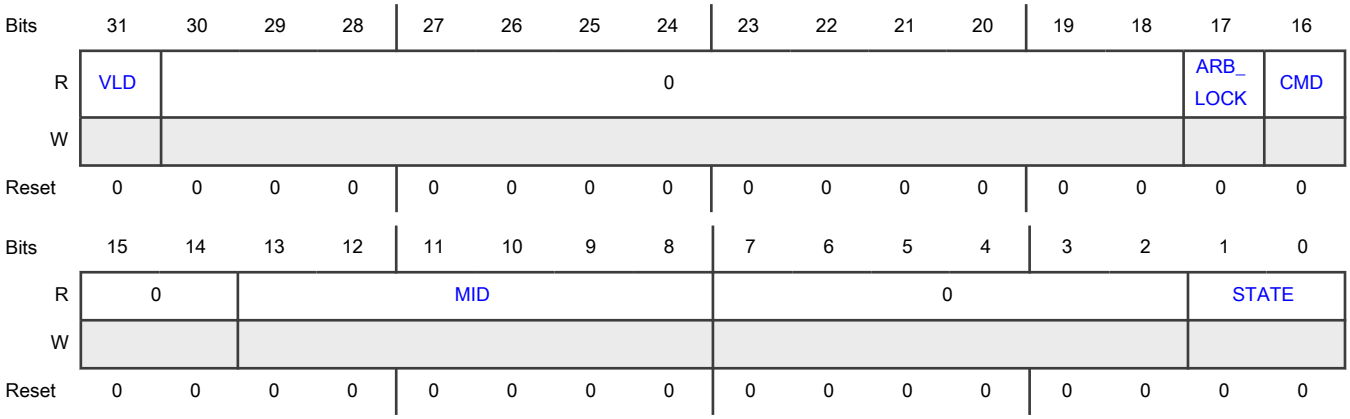
80.13.2.51 FSM Status (FSMSTAT)

Offset

Register	Offset
FSMSTAT	930h

Function
This register is access controlled and can only be programmed by privilege masters.

Diagram



Fields

Field	Function
31 VLD	Valid Indicates whether the FSM Status is valid. 0b - Status is invalid. No IPS transfer is queued. 1b - Status is valid. IPS transfer is queued or execution on QuadSPI.
30-18 —	Reserved
17 ARB_LOCK	Arbitration Lock Arbitration lock status for present request. 0b - Arbitration not locked 1b - Arbitration locked
16 CMD	Command Instruction type of currently initiated Flash transaction on QuadSPI. 0b - Read instruction sequence 1b - Non-read instruction sequence
15-14 —	Reserved
13-8 MID	Master ID Indicates the Master-ID of the currently initiated FlashSeq transaction on QuadSPI.
7-2 —	Reserved
1-0	FSM State Status

Table continues on the next page...

Table continued from the previous page...

Field	Function
STATE	00b - Transaction is Queued, but QuadSPI is busy with AHB transfer, any previous DMA transaction is ongoing, any residue data left in RDBFL or if any interrupt is pending.. 01b - TBDR lock is open. IPS master can write in TBDR. 10b - Write transfer is triggered. SEQID is written to QuadSPI. 11b - Read transfer is triggered. SEQID is written to QuadSPI.

80.13.2.52 IPS Error (IPSERROR)

Offset

Register	Offset
IPSERROR	934h

Function

This register contains the error status of IPS write on SFAR or IPCR registers if they are not qualified for any of the target group queues.

This register is access controlled and can only be programmed by privilege masters.

Diagram

Fields

Field	Function
31-15 —	Reserved
14 TO_ERR	Timeout Error This field is set if any flash transaction generated on QuadSPI results in timeout error and is aborted by SFP module. This field can be cleared by writing 1 to FLSEQREQ[CLR]. 0b - No timeout Error generated 1b - Timeout error is generated
13-12 TGnIPCR	TGn IPCR Error This field is set if any IPCR write generates error while being written to Target group queue. This field can be cleared by writing 1 to TG*n*IPCRS[CLR]. 0b - No Error generated 1b - Error is generated
11-10 TGnSFAR	TGn SFAR Error This field is set if any SFAR write generates error while being written to Target group queue. This field can be cleared by writing 1 to TG*n*SFARS[CLR]. 0b - No Error generated 1b - Error is generated
9 IPS_ERR	IPS Error Some common error occurred and IPS bus transfer error is also generated. The details of the IPS error can be found in IPSERROR register. This field can be cleared by writing 1 to IPSERROR[CLR].

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - No Error generated 1b - Error is generated
8-1 FRADnACC	FRADn Access Error This bit is set when the transaction address lies within the address range of this FRAD but it does not qualify the access permission checks for this FRAD or this FRAD was under exclusive lock (FRAD*n*_WORD3[EAL] = 10 or 11) by another master. It may also be set if the transaction address qualifies for multiple FRAD regions. 0b - No valid Error transaction 1b - Transaction is with error and target queue is cleared
0 FRADMTCH	No FRAD Match Error Transaction address does not lie within address range of any FRAD descriptor. 0b - No Error generated 1b - Transaction does not lie within any FRAD address range and error is generated

80.13.2.54 Interrupt Enable (INT_EN)

Offset

Register	Offset
INT_EN	93Ch

Function

This register is access controlled and can only be programmed by privilege masters.

NOTE

In case Queue Specific Error Interrupt bits (TG0SFAR,TG1SFAR,TG0IPCR,TG1IPCR) are enabled, ensure that the core executing interrupt handler can clear the Queue specific TGxSFARS and TGxIPCRS registers only when core's security attribute matches the queue. In case there is a mismatch in security attribute, you must change the TGMDADx.SA attribute of that queue to match the core SA attribute. After that, core can clear the error and then revert the changes in TGMDADx.SA field.

80.13.3 Serial flash memory address assignment

The serial flash memory address assignment can be modified by writing into Serial Flash Memory A1 Top Address Register (SFA1AD) and Serial Flash Memory A2 Top Address Register (SFA2AD) for device A

Table 803. Serial flash memory address assignment

Parameter	Function	Access mode
QuadSPI_AMBA_BASE ((31:10) - 22 bits)	QuadSPI AHB base address First address of the serial flash memory device as presented to the QuadSPI controller. This might be the base of the serial flash memory in the system address map or it may be a remapping, for instance to 0h, performed by the system. (See the system address map file attached to this document)	
QuadSPI_ARDB_BASE	First address of the QuadSPI Rx buffer on system memory map	
TOP_ADDR_MEMA1(TPADA1)	Top address for the external flash memory A1 (the first of the two independent flash memories sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA1 and QuadSPI_AMBA_BASE is routed to serial flash memory A1.
TOP_ADDR_MEMA2(TPADA2)	Top address for the external flash memory A2 (the second of the two independent flash memories sharing the IOFA)	Any access to the address space between TOP_ADDR_MEMA2 and TOP_ADDR_MEMA1 is routed to serial flash memory A2.

80.14 Flash memory mapped AMBA bus

QuadSPI_AMBA_BASE defines the address to be used as the start address of the serial flash memory device, as defined by the system memory map. Note that this may be a remapping of the physical address of the serial flash memory in the system. See the system address map for details.

Table 804. QuadSPI AMBA bus memory map

Address	Register name
QuadSPI_AMBA_BASE to (TOP_ADDR_MEMA2 - 1h)	• See Memory-mapped serial flash memory data—individual flash memory mode on flash memory A. • For information about byte ordering, see Table 776 and Table 777.
QuadSPI_ARDB_BASE to... (32 * 4 Byte) QuadSPI_ARDB_BASE + 1FFh	• See AHB RX Data Buffer Register (ARDB0 - ARDB31). • For information about the byte ordering, see Table 776.

NOTE

Any read access to non-implemented addresses provides undefined results.

In individual flash memory modes, the 3/4 address bytes (as programmed in the instruction/operand in the sequence) available for the flash memory address are determined by SFADR[23:0] or SFADR[31:0] as provided in the table shown above.

80.14.1 AHB bus access read considerations

Note that all logic in the QuadSPI module implementing the AHB bus access is designed to read the content of an external serial flash memory device. Therefore, the following restrictions apply to the QuadSPI module with respect to accesses to the AHB bus:

- Any AHB command resulting in the assertion of the FR[ABSEF] flag is answered with the ERROR condition according to the AMBA_AHB specification. The resulting AHB command is ignored.
- AHB bus read access types—NONSEQ and BUSY—are fully supported.
- AHB read access type—SEQ—is treated in the same way as NONSEQ. See Flash memory mapped AMBA bus for details.
- Early burst termination is not supported for AHB transactions.
- An AHB error response occurs when FR[AITEF] bit is set
- An AHB bus stall along with error response occurs when FR[AAEF] bit is set

80.14.2 Memory-mapped serial flash memory data—individual flash memory mode on flash memory A

Starting with address QuadSPI_AMBA_BASE, the content of the first external serial flash memory device is mapped into the address space of the device containing the QuadSPI module. Serial flash memory byte address 0h corresponds to bus address, QuadSPI_AMBA_BASE, in an increasing order. . See the following table for the address mapping. The byte ordering for 32-bit access is provided in Table 776 and for 64-bit read access, the byte ordering is provided in Table 777.

Table 805. Memory-mapped individual flash memory mode—flash memory A address scheme

Memory-mapped address 32-bit access	Memory-mapped address 64-bit access	Serial flash memory byte address	Flash memory device
QuadSPI_AMBA_BASE + 0h	QuadSPI_AMBA_BASE + 0h	0h to 3h	A1
QuadSPI_AMBA_BASE + 4h		4h to 7h	
...	...	...	
TOP_ADDR_MEMA1 - 8h	TOP_ADDR_MEMA1 - 8h	(TOP_ADDR_MEMA1- 8h) to (TOP_ADDR_MEMA1 - 0h4 -0h1)	
TOP_ADDR_MEMA1 - 4h		(TOP_ADDR_MEMA1 - 4h) to (TOP_ADDR_MEMA1 - 0h1)	
TOP_ADDR_MEMA1 + 4h	TOP_ADDR_MEMA1 + 0h	0h to 3h	A2
TOP_ADDR_MEMA1 + 0h4		4h to 7h	
...	...	...	
TOP_ADDR_MEMA2 - 8h	TOP_ADDR_MEMA2 - 8h	(TOP_ADDR_MEMA2 - 8h) to (TOP_ADDR_MEMA2 - 4h - 1h)	
TOP_ADDR_MEMA2 - 4h		(TOP_ADDR_MEMA2 - 4h) to (TOP_ADDR_MEMA2 - 1h)	

The available address range depends on the size of the external serial flash memory device. Any access beyond the size of the external serial flash memory provides undefined results.

For details concerning the read process, see Flash memory read.

80.14.3 ARDB register descriptions

NOTE

See the system memory map in this document for the base address of the QuadSPI AHB RX data buffer.

80.14.3.1 ARDB memory map

QuadSPI_ARDB base address: 6800_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h - 7Ch	AHB RX Data Buffer Register (ARDB0 - ARDB31)	32	R	0000_0000h

80.14.3.2 AHB RX Data Buffer Register (ARDB0 - ARDB31)

Offset

For a = 0 to 31:

Register	Offset
ARDBa	0h + (a × 4h)

Function

This register is used to read the buffer content of the RX buffer from successive addresses. ARDB0 corresponds to the RX buffer register entry corresponding to the current value of the read pointer in an increasing order.

The increment of the read pointer depends on the access scheme (DMA or flag-driven). See Flash memory read, RX buffer, data read through register interface, and AHB read for the description of successive accesses to the RX buffer content. See Byte Ordering of Serial Flash Memory Read Data for the byte ordering scheme.

Valid address range accessible in the ARDB*n* range depends on the number of RX buffer entries implemented and on the number of valid buffer entries available in the RX buffer.

- Example 1 - RX buffer filled completely with 32 words: In this case, the address range for valid read access extends from ARDB0 to ARDB31 .
- Example 2 - RX buffer filled with five valid words; RX buffer fill level RBSR[RDBFL] is 5. In this case, an access to ARDB4 provides the last valid entry.

Chapter 81
Ultra Secured Digital Host Controller (uSDHC)

81.1 Chip-specific uSDHC information

81.1.1 uSDHC instances and configuration

This chip supports up to one instance of uSDHC module.

Table 806. uSDHC instances

Instance	S32K358/S32K348/S32K338/S32K328	S32K310/S32K311/S32K312/S32K314/ S32K322/S32K324/S32K341/S32K342/S32K344/ S32K388/S32K389
uSDHC	Yes	No

Table 807. Features supported

Features	Notes
MMC	• System specification version 4.2/4.3/4.4/4.41 • Bit Widths x1/x4/x8 • Full Speed Mode upto 25MHz • High Speed SDR upto 50MHz • High Speed DDR mode (50MHz both edges)
SD/ SDIO	• Card Specification version 2.0/3.0 • Bit Widths x1/x4 • Full Speed Mode upto 25MHz • High Speed Mode upto 50MHz
FIFO	128 x 32 external FIFO supported
External DMA	Supported
Write Protect WP system implementation	Supported
Voltage support	3.3 V

NOTE

- uSDHC cannot directly write QSPI if flash page is not 512 bytes.
- Card clock pin should have weak pull down enabled when configured for uSDHC function.

This chip doesn't support the following features:

- MMC HS400 MODE
- Card Detection (CD) System Implementation
- LED control (LCTL) output signal
- IO power Voltage selection Signal (VSELECT)
- Input clock for eMMC HS400 mode (STROBE)

- DLL tuning is not supported in S32K358 since SDHC has 50 MHz frequency. Whereas, ideal tuning frequency requirement is 200 MHz.

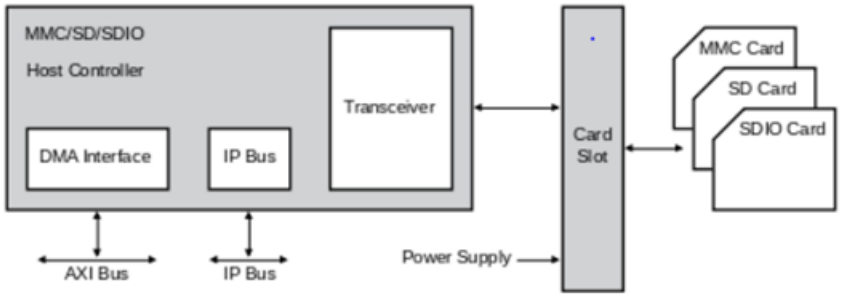

Figure 534. System connection of uSDHC

81.1.2 Sequence for DLL implementation in SDR25 mode

To implement DLL in SDR25 mode the following steps need to be done without using CMD19 and CMD21:

1. Set TUNING_CTRL[STD_TUNING_EN] to 0.
2. Set MIX_CTRL[EXE_TUNE] to 0.
3. Set SYS_CTRL[RSTA] to reset all.
4. Set MIX_CTRL[SMP_CLK_SEL] to 1.
5. Set bit[14:0] of CLK Tuning Control and Status (CLK_TUNE_CTRL_STATUS) with the 32'h400. This needs to be configured as per the number of delay cells.
6. Poll bit[30:16] of CLK Tuning Control and Status (CLK_TUNE_CTRL_STATUS) until the value written in Step 5 above is read.

81.2 Overview

uSDHC provides the interface between the host system and the eMMC, SD card, and SDIO as shown in Figure 536. The module acts as a bridge, passing host bus transactions to the eMMC, SD card, and SDIO by sending commands and performing data accesses to/from the cards. It handles the SD card/SDIO/eMMC protocols at the transmission level.

81.2.1 Block diagram

The following figure illustrates the block diagram for uSDHC. Dual port SRAM is FIFO for write/read. For more information, see Data buffer.

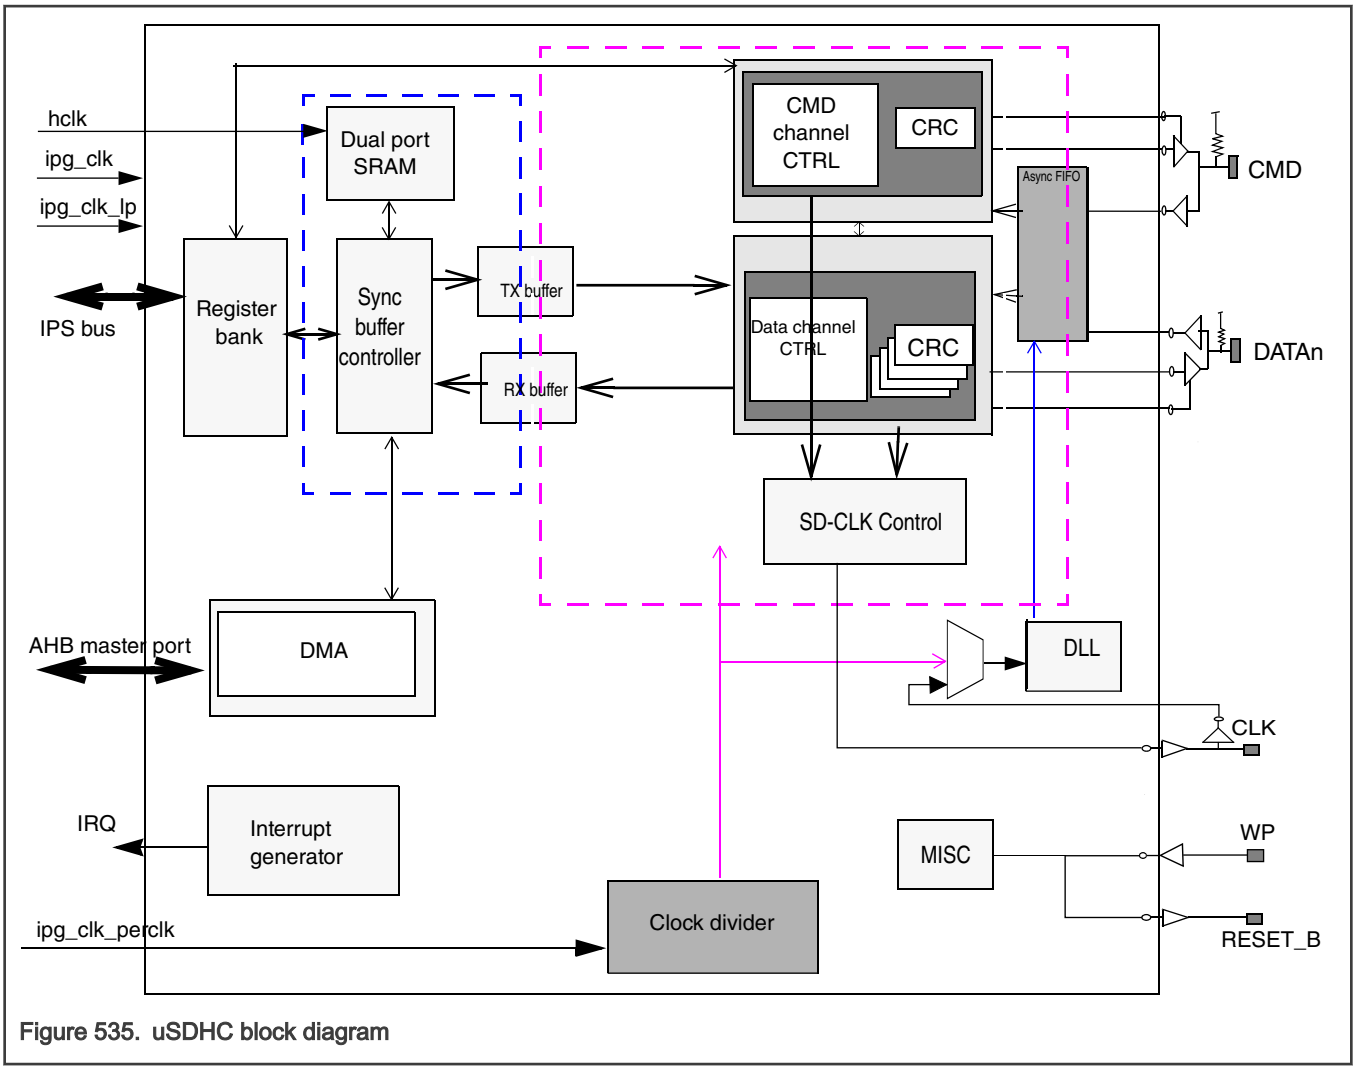

Figure 535. uSDHC block diagram

The figure below shows the System connection of uSDHC:

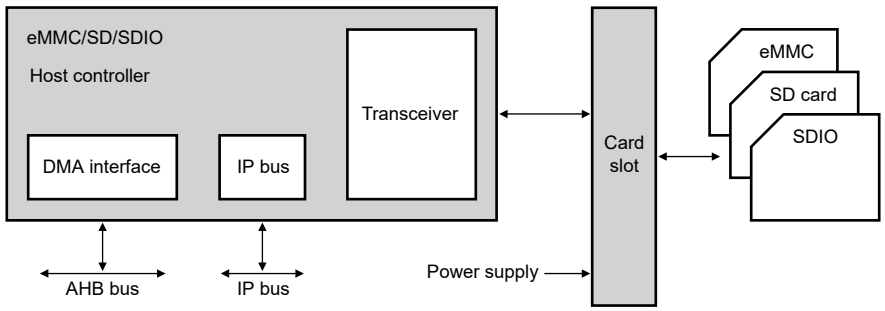

Figure 536. System connection of uSDHC

The following are brief descriptions of the cards supported by uSDHC:

- The Embedded MultiMediaCard (eMMC) is a universal low-cost data storage and communication media designed to cover a wide array of applications including mobile video and gaming. Previous eMMC were based on a 7-pin serial bus with a single data pin, while the new high speed eMMC communication is based on an advanced 11-pin serial bus designed to operate in the low-voltage range.

- The Secure Digital Card (SD) is an evolution of the old eMMC technology. It is specifically designed to meet the security, capacity, performance, and environmental requirements inherent in newly emerging audio and video consumer electronic devices. The physical form factor, pin assignment, and data transfer protocol are backward compatible with the old eMMC (with some additions).
- Under the SD protocol, system connection can be categorized into memory card, I/O card, and combo card, which have both memory and I/O functions. The memory card invokes a copyright protection mechanism that complies with the security of the SDMI (Secure Digital Music Initiative) standard. The I/O card, which is also known as SDIO, provides high-speed data I/O with low-power consumption for mobile electronic devices.

81.2.2 Features

The list given below shows the features of the uSDHC module:

- Conforms to the SD Host Controller Standard Specification version 2.0
- Compatible with the eMMC System Specification version 4.2/4.3/4.4/4.41
- Compatible with the SD Memory Card Specification version 3.0 and supports the Extended Capacity SD Memory Card
- Compatible with the SDIO Specification version 2.0
- Designed to work with SD Memory, miniSD Memory, SDIO, miniSDIO, SD Combo, eMMC, MMC plus, and MMC RS cards
- For card bus clock frequency: See the product Data Sheet for the clock frequency of each supported mode.
- Supports 1-bit/4-bit SD and SDIO modes, and 1-bit/4-bit/8-bit eMMC modes
  - Up to 200 Mbps of data transfer for SDIO using four parallel data lines in the Single Data Rate (SDR) mode
  - Up to 400 Mbps of data transfer for SDIO using four parallel data lines in the Dual Data Rate (DDR) mode
  - Up to 200 Mbps of data transfer for SDXC cards using four parallel data lines in the Single Data Rate (SDR) mode
  - Up to 400 Mbps of data transfer for SDXC card using four parallel data lines in the Dual Data Rate (DDR) mode
  - Up to 416 Mbps of data transfer for eMMC using eight parallel data lines in the Single Data Rate (SDR) mode
  - Up to 832 Mbps of data transfer for eMMC using eight parallel data lines in the Dual Data Rate (DDR) mode
- Supports single block/multi-block read and write
- Supports block sizes of 1 ~ 4096 bytes
- Supports the write protection switch for write operations
- Supports both synchronous and asynchronous abort
- Supports pause during the data transfer at block gap
- Supports SDIO Read Wait and Suspend Resume operations
- Supports Auto CMD12 for multi-block transfer
- Host can initiate non-data transfer command while data transfer is in progress
- Allows cards to interrupt the host in 1-bit and 4-bit SDIO modes; also supports interrupt period
- Embodies a fully configurable 128x32-bit FIFO for read/write data
- Supports internal and external DMA capabilities
- Supports voltage selection by configuring vendor-specific register bit
- Supports Advanced DMA to perform linked memory access

NOTE

This block can support all the above-listed speed mode and maximum data throughput. However, these may be specific to the device. See the corresponding chip-specific information or the device data sheet for accurate details.

81.3 Functional description

The following sections provide a brief functional description of the major system blocks, including the data buffer, DMA AHB interface, register bank as well as IP Bus interface, dual-port memory wrapper, data/command controller, clock and reset manager, and clock generator.

81.3.1 Modes and operations

81.3.1.1 Data transfer modes

The uSDHC module can select the following modes for data transfer:

- SD 1-bit
- SD 4-bit
- eMMC 1-bit
- eMMC 4-bit
- eMMC 8-bit
- Identification mode (up to 400 kHz)
- eMMC full-speed mode (up to 26 MHz)
- eMMC high-speed mode (up to 52 MHz)
- eMMC DDR mode (52 MHz both edges)
- SD card or SDIO full-speed mode (up to 25 MHz)
- SD card or SDIO high-speed mode (up to 50 MHz)

NOTE

This block can support all the above listed speed mode and maximum clock frequency. However, these may be specific to the device. See the corresponding chip-specific information or the device data sheet for accurate details.

81.3.2 Data buffer

The uSDHC module uses one configurable data buffer to transfer data between the system bus (IP bus or advanced high-performance bus (AHB) bus) and the SD card in an optimized manner, maximizing throughput between the two clock domains (IP peripheral clock and the master clock). The buffer is used as a temporary storage for transferring data between the host system and the card. The watermark levels for read and write are both configurable and can range between 1 to 128 words. The burst lengths for read and write are also configurable and can range between 1 to 31 words. The next figure provides the uSDHC buffer scheme as buffer control and buffer RAM wrapper.

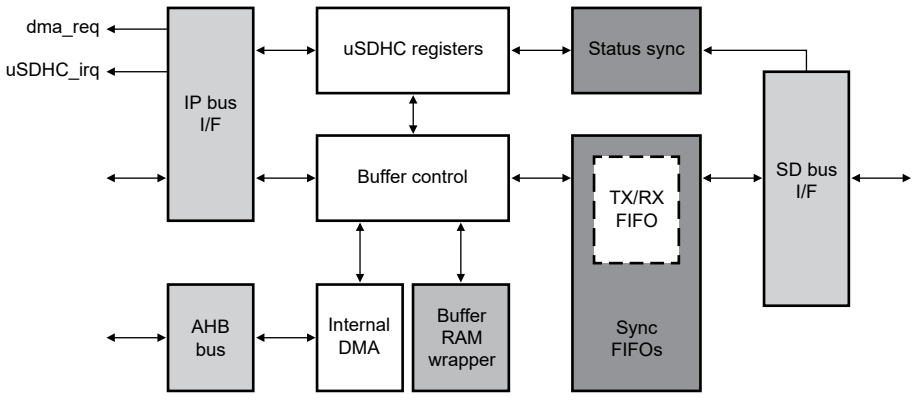

Figure 537. uSDHC buffer scheme

Here are 3 transfer modes to access the data buffer:

- CPU polling mode:
  - For a host-read operation, when the number of words received in the buffer meets or exceeds the RD_WML watermark value, by polling the BRR bit, the host driver can read the Buffer Data Port register to fetch the amount of words set in the RD_WML register from the buffer. The write operation is similar. For more information on the process of writing operation, see Write operation sequence.
- External DMA mode:
  - For a read operation, when there are more words received in the buffer than the amount set in WTMK_LVL[RD_WML], a DMA request is sent out to inform the external DMA to fetch the data. The request will be immediately de-asserted when there is an access on the Data Buffer Access Port (DATA_BUFF_ACC_PORT). If the number of words in the buffer after the current burst meets or exceeds RD_WML value, the DMA request is asserted again. For instance, if there are twice as many words in the buffer as there are in the RD_WML value, there are two successive DMA requests with only one cycle of de-assertion between. The write operation is similar. Note the accesses CPU polling mode and external DMA mode both use the IP bus, and if the external DMA is enabled, in both modes an external DMA request is sent when the buffer is ready.
- Internal DMA mode (includes simple and advanced DMA accesses):
  - The internal DMA access, either by simple or advanced DMA, is over the AHB bus. For internal DMA access mode, the external DMA request will never be sent out.

For a read operation, when there are more words in the buffer than the amount set in WTMK_LVL[RD_WML], the internal DMA starts fetching data over the AHB bus. Except for INCR4 and INCR8, the burst type is always the INCR mode and the burst length depends on the shortest of the following factors:

- Burst length configured in the burst length field of the Watermark Level register
- Watermark level boundary
- Block size boundary
- Data boundary configured in the current descriptor (if the ADMA is active)
- 1 KB address boundary defined in the AHB protocol

The Write operation functions in a similar manner—sequential and contiguous access is necessary to ensure that the pointer address value is correct. Random or skipped access is not possible. The byte order, by reset, is little endian mode. The actual byte order is swapped inside the buffer, according to the endian mode configured by software (see the following figures). For a host write operation, the byte order is swapped after the data is fetched from the buffer and ready to send to the SD Bus. For a host read operation, the byte order is swapped before the data is stored in the buffer.

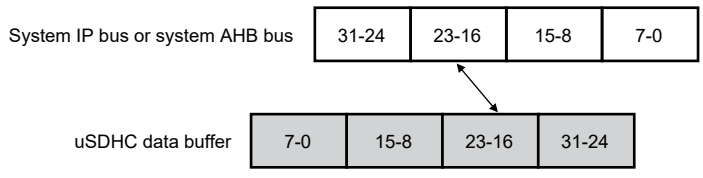

Figure 538. Data swap between system bus and uSDHC data buffer in the byte little endian mode

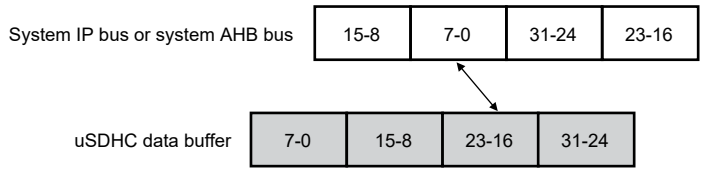

Figure 539. Data swap between system bus and uSDHC data buffer in half word big endian mode

81.3.2.1 Write operation sequence

There are 3 ways to write data into the buffer when the user transfers data to the card:

- External DMA through the uSDHC DMA request signal
- Processor core polling through the BWR bit in the Interrupt Status register (interrupt or polling)
- Internal DMA

When the internal DMA is not used, the DMAEN bit in the Transfer Type register is not set when the command is sent, uSDHC asserts a DMA request when the amount of buffer space exceeds the value set in WTMK_LVL[WR_WML] and is ready for receiving new data. At the same time, uSDHC sets the BWR bit. The buffer write ready interrupt is generated if it is enabled by software.

When internal DMA is used, uSDHC does not inform the system before all the required number of bytes are transferred (if no error is encountered). When an error occurs during the data transfer, uSDHC aborts the data transfer and abandons the current block. The host driver should read the contents of the DMA System Address register to obtain the starting address of the abandoned data block. If the current data transfer is in multi-block mode, uSDHC does not automatically send CMD12, even though the AC12EN bit in the Transfer Type register is set. The host driver sends CMD12 in this scenario and restarts the write operation from that address. It is recommended that a software reset for Data be applied before the transfer is restarted.

The uSDHC module does not start data transmission until the buffer has been filled with the number of words set in the WR_WML register. If the buffer is empty and the host system does not write data in time, uSDHC stops the CLK to avoid the data buffer underrun situation.

81.3.2.2 Read operation sequence

There are 3 ways to read data from the buffer when the data is received from the card:

- External DMA through uSDHC DMA request signal
- Processor core polling through the BRR bit in the Interrupt Status register (interrupt or polling)
- Internal DMA

When internal DMA is not used (DMAEN bit in Transfer Type register is not set when the command is sent), uSDHC asserts a DMA request when the amount of data exceeds the value set in the RD_WML register, which is available and ready for system fetching data. At the same time, uSDHC sets the BRR bit. The buffer read ready interrupt is generated if it is enabled by the software.

When internal DMA is used, uSDHC does not inform the system before all the required number of bytes are transferred (if no error is encountered). When an error occurs during the data transfer, uSDHC aborts the data transfer and abandons the current block. The host driver should read the content of the DMA System Address register to get the starting address of the abandoned data block. If the current data transfer is in multi-block mode, uSDHC does not automatically send CMD12, even though the AC12EN bit in the Transfer Type register is set. The host driver sends CMD12 in this scenario and restarts the read operation from that address. It is recommended that a software reset (in register RSTD) for data be applied before the transfer is restarted.

For any read transfer mode, uSDHC does not start data transmission until the number of words set in the RD_WML register are in buffer. If the buffer is full and the host system does not read data in time, uSDHC stops the CLK to avoid the data buffer overrun situation.

81.3.2.3 Data buffer and block size

In the uSDHC module, the data buffer can hold up to 128 words (32-bit) and the watermark levels for write and read can be configured accordingly. The user needs to know the buffer size for the buffer operation during a data transfer to utilize it in the most optimized way. For both read and write, the watermark level can range between 1 to 128 words. For both read and write, the burst length can range between from 1 to 31 words. The host driver may configure the value according to the system and requirement.

During a multi-block data transfer, the block length can be set to any value between 1 and 4096 bytes, satisfying the requirements of the external card. The only restriction is from the external card, which can be limited in size or support of a partial block access (which is not the integer times of 512 bytes). That means, the largest block size is 512 bytes.

As uSDHC treats each block individually, for block sizes which are not multiples of four (not word-aligned), stuffed bytes are required at the end of each block. For example, if the block size is 7 bytes and there are 12 blocks to write, the software side must write twice for each block. For each block, the ending byte is abandoned by uSDHC because it only sends 7 bytes to the card and picks data from the following system write, resulting in 24 beats of write access in total.

81.3.2.4 Dividing large data transfer

This SDIO command CMD53 definition limits the maximum data size of data transfers according to the following formula:

Max data size = Block size x Block count

The length of a multiple block transfer needs to be in multiples of block size. If the total data length cannot be divided evenly into a multiple of the block size, then there are two options to transfer the data. These two options depend on the function and the card design. Option 1 is for the host driver to split the transaction. The remainder of the block size data is then transferred by using a single block command at the end. Option 2 is to add dummy data in the last block to fill the block size. For option 2, the card must manage the removal of the dummy data. Only for write, uSDHC sends data to the card.

See Figure 540 for an example showing the division of large data transfers, assuming a kind of WLAN SDIO that only supports a block size of up to 64 bytes. Although uSDHC supports a block size of up to 4096 bytes, SDIO can only accept a block size of less than 64 bytes, so the data must be divided (see the example below).

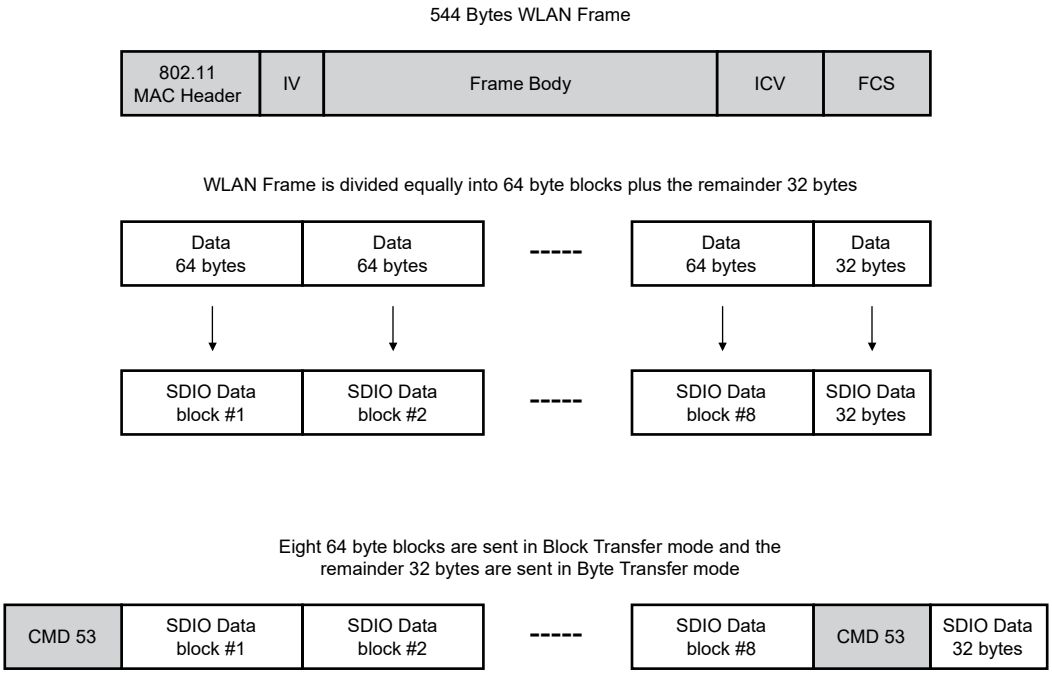

Figure 540. Example for dividing large data transfers

81.3.2.5 External DMA request

When the internal DMA is not in use and external DMA is enabled, the Data Buffer will generate a DMA request to the system. During a write operation, when the number of WR_WML words can be held in the buffer free space, the signal uSDHC_dreq_b is asserted to 0, informing the Host System of a DMA write.

The BWR bit in the Interrupt Status register is also set, as long as the BWRSEN bit in the Interrupt Status Enable register is set. The DMA request is de-asserted after several accesses to the Data Buffer Access Port (DATA_BUFF_ACC_PORT) are made while the buffer's free space can't meet the watermark condition (free space> write watermark level).

On read operation, when the number of RD_WML words are already in the buffer, the signal uSDHC_dreq_b is asserted to 0, informing the Host System for a DMA read. The BRR bit in the Interrupt Status register is also set, as long as the BRRSEN bit in

the Interrupt Status Enable register is set. The DMA request is de-asserted after several accesses to the Data Port register are made while the buffer's data can't meet the watermark condition (the number of data in buffer > read watermark level).

If the DMA burst length can't change during a data transfer for an external DMA transfer, the watermark level (read or write) must be a divisor of the block size. If it is not, transferring the block may cause buffer under-run (read operation) or over-run (write operation). For example, if the block size is 512 bytes, the watermark level of read (or write) must be a power of two between 1 and 128. For processor core polling access there is no such issue, as the last access in the block transfer can be controlled by software. The watermark level can be any value, even larger than the block size (but no greater than 128 words) because the actual number of bytes transferred by the software can be controlled and does not exceed the block size in each transfer.

The uSDHC also supports non-word aligned block size, as long as the card supports that block size. In this case, the watermark level should be set as the number of words. For example, if the block size is 31 bytes, the watermark level can be set to any number of words. For this case, the BLK_ATT[BLKSIZE] will be set as 1fh. For the CPU polling access, the burst length can be 1 to 128 words, without restriction. This is because the software will transfer 8 words, and the uSDHC will also set the BWR or BRR bits when the remaining data does not violate data buffer. See DMA burst length for more details about the dynamic watermark level of the data buffer.

For the above example, even though 8 words are transferred via Data Buffer Access Port (DATA_BUFF_ACC_PORT), the uSDHC will transfer only 31 bytes over the SD Bus, as required by the BLK_ATT[BLKSIZE] fields. In this data transfer, with non-word aligned block size, the endian mode should be set cautiously or invalid data will be transferred to and from the card.

81.3.3 DMA AHB interface

The internal DMA implements a DMA engine and the AHB master. When the internal DMA is enabled, but the BWR and BRR bits are set if the BWRSEN and BRRSEN bits have been set in the Interrupt Status Enable register. See Figure 541 for an illustration of the DMA AHB interface block.

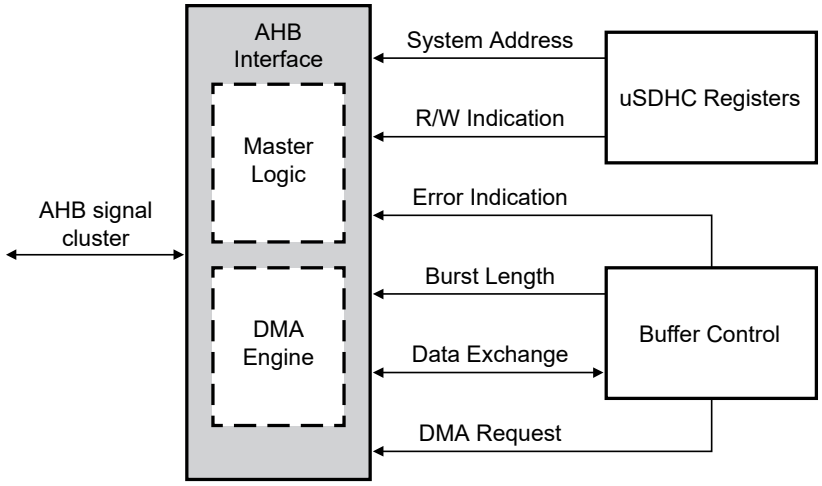

Figure 541. DMA AHB interface block

81.3.3.1 Internal DMA request

If the watermark level requirement is met in data transfer or if the last data of current block is ready in the data buffer, and the Internal DMA is enabled, the data buffer block sends a DMA request to AHB interface. Meanwhile, the external DMA request signal (uSDHC_dreq_b) is disabled.

The delay in response from the internal DMA engine depends on the system AHB bus loading and the priority assigned to uSDHC. The DMA engine does not respond to the request during its burst transfer, but is ready to serve as soon as the burst is over. The data buffer de-asserts the request if the data buffer space (for write) or bytes in data buffer is smaller than the watermark level. Upon access to the buffer by internal DMA, the data buffer updates its internal buffer pointer, and when the watermark level is satisfied or the last data of the current block is ready in the data buffer, another DMA request is sent.

The data transfer is in the block unit, and the subsequent watermark level is always automatically set as the remaining number of words. For instance, for a multi block data read with each block size of 31 bytes, and the burst length set to six words (24 bytes). After the first burst transfer, if there are greater than or equal to two words in the buffer, which might contain some data of the next block), another DMA request is sent. This is because the remaining number of words to transfer for the current block is ceiling((31 - 6 * 4) / 4) = 2. The uSDHC module reads two words out of the buffer, with seven valid bytes and one stuffed byte.

81.3.3.2 DMA burst length

Just like a CPU polling access, the DMA burst length for the internal DMA engine can range between 1 to 16 words. The actual burst length for the DMA depends on the lesser of the configured burst length or the remaining words of the current block. See the example in Internal DMA request. After six words are read, the burst length is two words, then the next burst length is six words. This is because the next block starts, which is 31 bytes, more than six words. The host driver may take this variable burst length into account. It is also acceptable to configure the burst length as the divisor of the block size, so that each time the burst length is the same.

81.3.3.3 AHB master interface

It is possible that the internal AHB DMA engine could fail during the data transfer. Upon detection of an AHB bus error during DMA transfer, the DMA engine stops the transfer and goes to the idle state. At that point, the internal data buffer stops receiving incoming data and sending out data. The DMAE bit in the Interrupt Status register is generated to host CPU to report a bus error condition.

After the DMAE interrupt is received, the software sends a CMD12 to abort the current transfer and read the DS_ADDR bits of the DMA System Address register to get the starting address of the corrupted block. After the DMA error is fixed, the software should apply a data reset and restart the transfer from this address to recover the corrupted block.

81.3.3.4 ADMA engine

In the SD host controller standard, a new DMA transfer algorithm called the Advanced DMA (ADMA) is defined. For simple DMA, after the page boundary is reached, a DMA interrupt is generated and the new system address is programmed by the host driver. The ADMA defines the programmable descriptor table in the system memory. The host driver can calculate the system address at the page boundary and program the descriptor table before executing ADMA. It reduces the frequency of interrupts to the host system. Therefore, higher speed DMA transfers could be realized because the host MCU intervention is not be needed during long DMA-based data transfers.

There are two types of ADMA in host controller: ADMA1 and ADMA2. ADMA1 can support data transfer of 4KB aligned data in system memory, and ADMA2 eliminates the restriction so that the data of any location and any size can be transferred in system memory. Their formats of Descriptor Table are different.

ADMA can recognize all kinds of descriptors defined in SD host controller Standard, and if the "End" flag is detected in the descriptor, ADMA stops after this descriptor is processed.

81.3.3.4.1 ADMA concept and descriptor format

ADMA1 includes the following descriptors:

- Valid/invalid descriptor
- Nop descriptor
- Set data length descriptor
- Set data address descriptor
- Link descriptor
- Interrupt flag and end flag in descriptor

ADMA2 includes the following descriptors:

- Valid/invalid descriptor
- Nop descriptor

- Rsv descriptor (new in ADMA2)
- Set data length and address descriptor
- Link descriptor
- Interrupt flag and end flag in descriptor

ADMA starts read/write operation after it reaches the tran state, using the data length and data address analyzed from most recent descriptor(s).

For ADMA1, the valid data length descriptor is the last set type descriptor before the tran type descriptor. Every tran type descriptor triggers a transfer, and the transfer data length is extracted from the most recent set type descriptor. If there is no set type descriptor after the previous Trans descriptor, the data length is the value for previous transfer, or 0 if no set descriptor is ever met.

For ADMA2, the tran type descriptor contains both data length and transfer data address, so the tran type descriptor itself can start a data transfer.

See Figure 542 for the format of the descriptor table for ADMA1.

Address/ Page Field		Address/ Page Field		Attribute Field					
31	12	11	6	5	4	3	2	1	0
Address or Data Length		000000		Act 2	Act 1	0	Int	End	Valid

Act 2	Act1	Symbol	Comment	31- 28	27- 12
0	0	Nop	No Operation	Don't Care	
0	1	Set	Set Data Length	0000	Data Length
1	0	Tran	Transfer Data	Data Address	
1	1	Link	Link Descriptor	Descriptor Address	

Valid	Valid = 1 indicates this line of descriptor is effective. If Valid = 0 generate ADMA Error Interrupt and stop ADMA.
End	End = 1 indicates current descriptor is the ending one.
Int	Int = 1 generates DMA Interrupt when this descriptor is processed.

Figure 542. Format of the ADMA1 descriptor table

See Figure 543 for the concept and access method of the descriptor table for ADMA1.

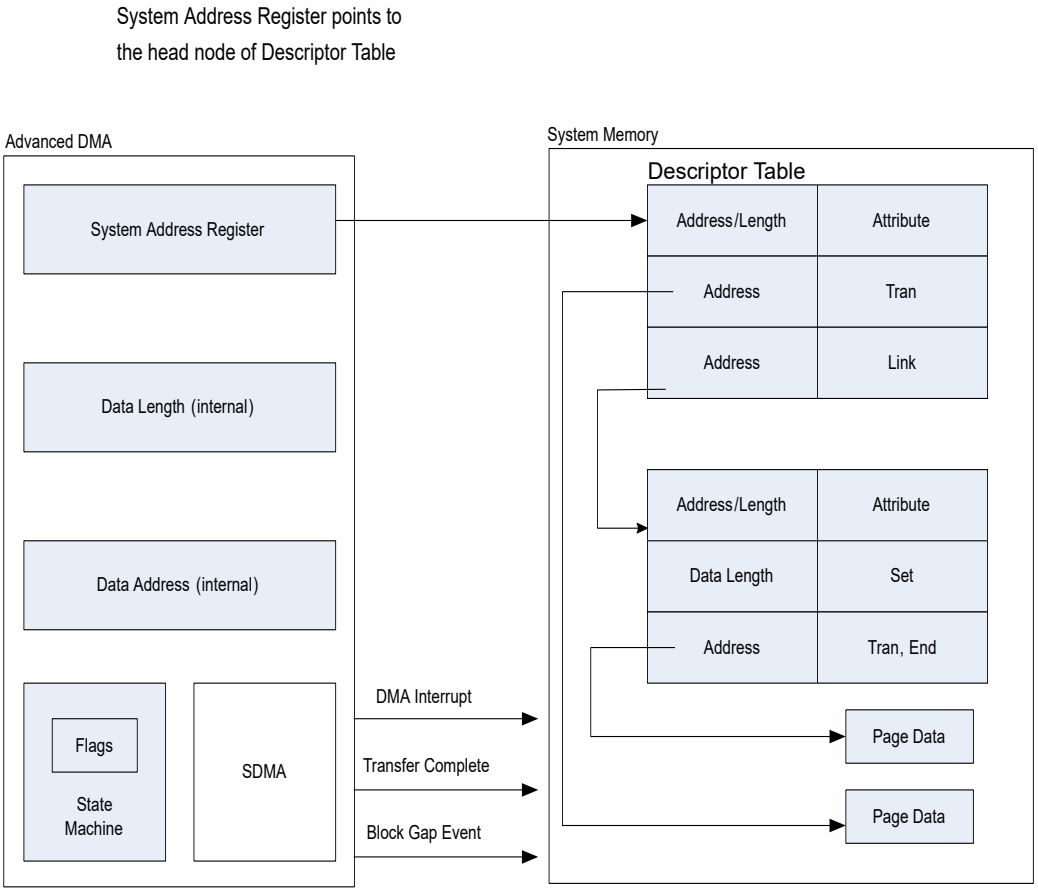

Figure 543. Concept and access method of the ADMA1 descriptor table

The figure below explains the ADMA2 format. ADMA2 deals with the lower 32-bit first, and then the higher 32-bit. If the 'Valid' flag of descriptor is 0, it ignores the higher 32-bit. The Address field should be set to word aligned (lower 2-bit is always set to 0). Data length is in byte unit.

Address Field		Length		Reserved		Attribute Field					
63	32	31	16	15	06	05	04	03	02	01	00
32-bit Address		16-bit length		0000000000		Act 2	Act 1	0	Int	End	Valid

Act 2	Act1	Symbol	Comment	Operation
0	0	Nop	No Operation	Don't Care
0	1	Rsv	Reserved	Same as Nop. Read this line and go to next one
1	0	Tran	Transfer Data	Transfer data with address and length set in this descriptor line
1	1	Link	Link Descriptor	Link to another descriptor

Valid	Valid = 1 indicates this line of descriptor is effective. If Valid = 0 generate ADMA Error Interrupt and stop ADMA.
End	End = 1 indicates current descriptor is the ending one.
Int	Int = 1 generates DMA Interrupt when this descriptor is processed.

Figure 544. Format of the ADMA2 descriptor table

See Figure 545 for the concept and access method of the descriptor table for ADMA2.

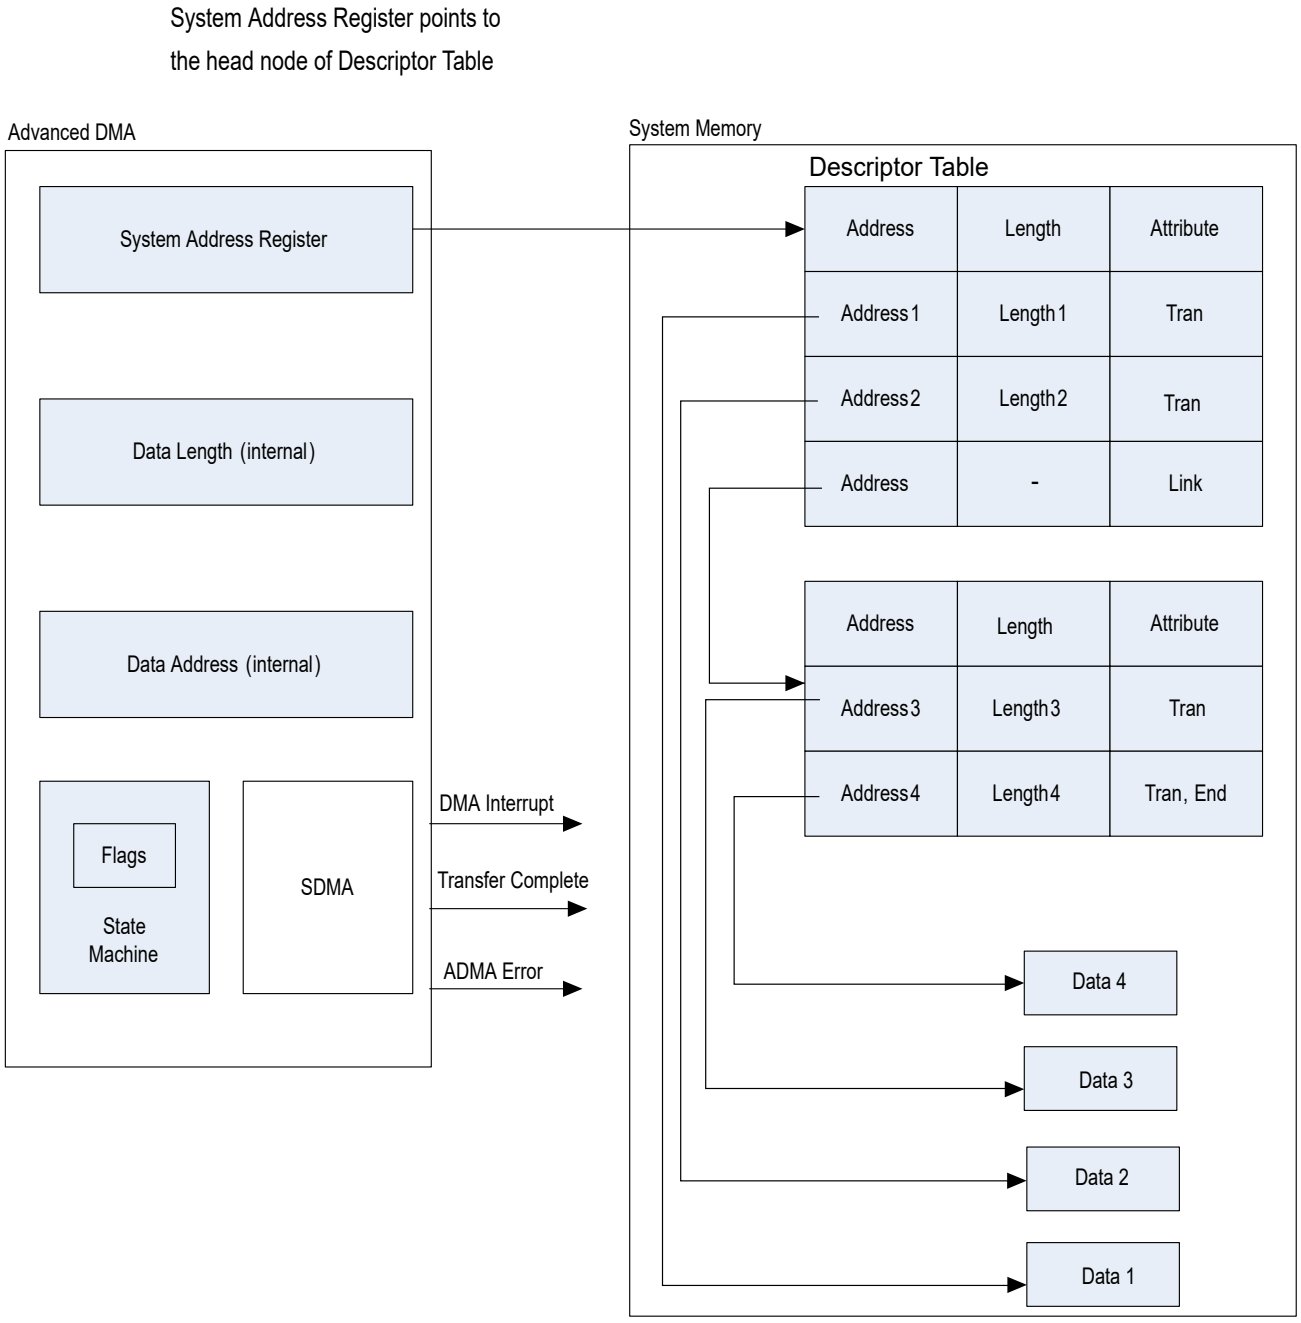

Figure 545. Concept and access method of the ADMA2 descriptor table

81.3.3.4.2 ADMA interrupt

If the interrupt flag descriptor is set, ADMA generates an interrupt according to various types of descriptors.

For ADMA1:

- Set type of descriptor: interrupt is generated when data length is set.
- Tran type descriptor: interrupt is generated when this transfer is complete.
- Link type of descriptor: interrupt is generated when new descriptor address is set.

- Nop type of descriptor: interrupt is generated just after this descriptor is fetched.

For ADMA2:

- Tran type of descriptor: interrupt is generated when this transfer is complete.
- Link type of descriptor: interrupt is generated when new descriptor address is set.
- Nop/Rsv type of descriptor: interrupt is generated just after this descriptor is fetched.

81.3.3.4.3 ADMA error

The ADMA stops whenever an error is encountered. These errors include:

- Fetching descriptor error
- AHB response error
- Data length mismatch error

An ADMA descriptor error is generated when it fails to detect a "valid" flag in the descriptor. If an ADMA descriptor error occurs, the interrupt is not generated even if the "Interrupt" flag of this descriptor is set.

When BLKCNTEN bit is set, data length set in register BLK_ATT must be equal to the whole data length set in descriptor, otherwise data length mismatch error is generated.

When BLKCNTEN bit is not set, then the whole data length set in descriptor is a multiple of block lengths; otherwise, when data set in the descriptor nodes are not performed at block boundaries, then data mismatch errors occur.

81.3.4 Register bank with IP bus interface

Register accesses through the IP bus interface are on the register bank. See Figure 546 for the block diagram.

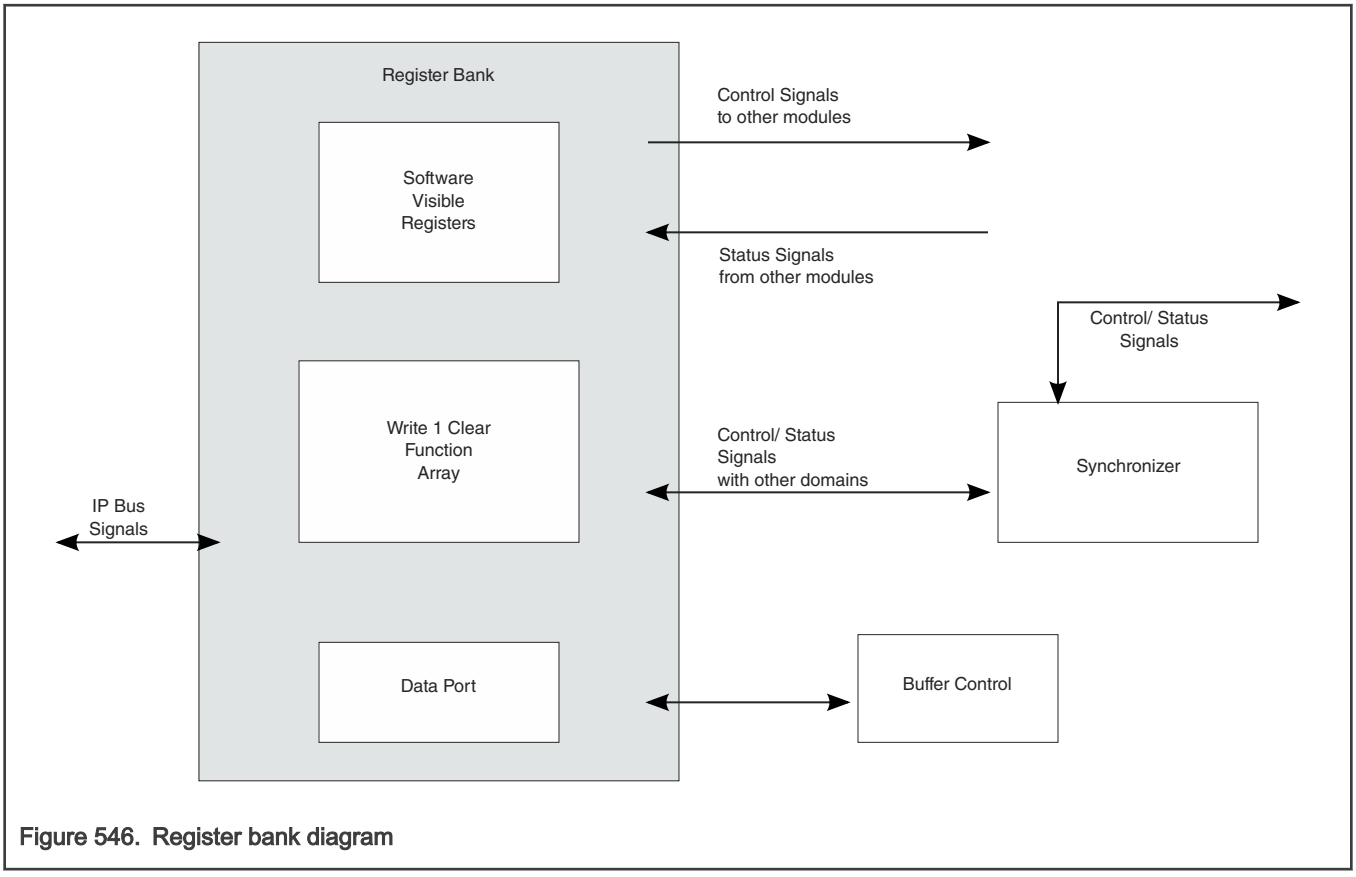

Figure 546. Register bank diagram

Only a 32-bit access is allowed, and no partial read/write is supported; therefore, all accesses are word aligned.

Access to an unimplemented address within the register memory map space does not generate a transfer error.

81.3.4.1 SD protocol unit

The SD protocol unit deals with all SD protocol affairs.

The SD protocol unit performs the following functions:

- Acts as the bridge between the internal buffer and the SD bus
- Sends the command data as well as its argument serially
- Stores the serial response bit stream into corresponding registers
- Detects the bus state on the CMD/DAT lines
- Monitors the interrupt from SDIO
- Asserts the read wait signal
- Gates off the SD clock when buffer is announcing danger status
- Detects the write protect state

The SD protocol unit consists of four sub-modules:

- SD control misc
- Command control
- Data control
- Clock control

81.3.4.2 SD control miscellaneous

In the SD control miscellaneous unit:

- The card detection (including DATA3 for card detection) and card interrupt are implemented.
- The module monitors the signal level on all the eight data lines and the command lines. It directly routes the level values into the register bank.
- The module also detects the Write Protect (WP) line. If WP is active, writes to memory and combo cards are ignored.

81.3.4.3 SD clock control

If the internal data buffer is near full (for read) or near empty (for write), the SD clock must be gated off to avoid buffer over/under-run. This module asserts the gate of the output SD clock to shut the clock off. After the buffer has space (for read) or has data (for write), the clock gate of this module opens, and the SD clock is active again.

81.3.4.4 Command control

The Command Control module deals with the transactions on the CMD line.

See Figure 547 for an illustration of the structure for the Command CRC shift register.

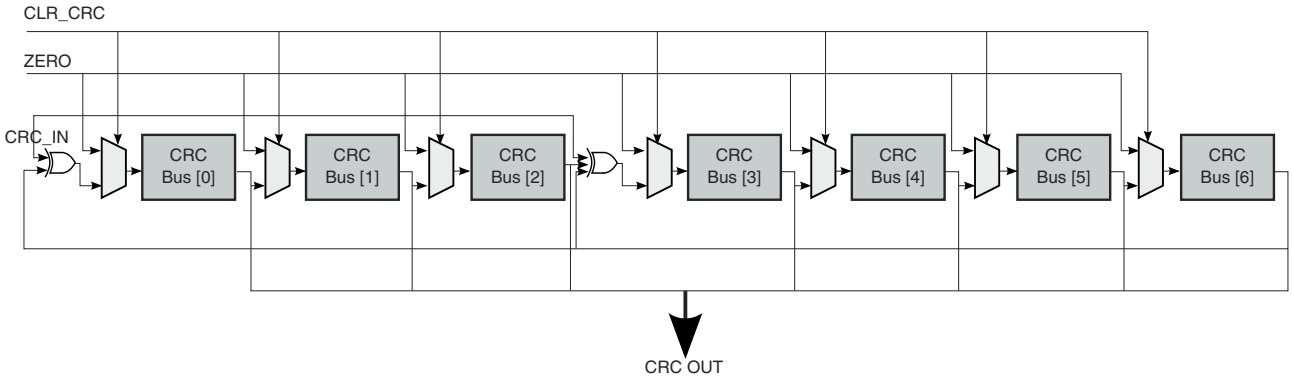

Figure 547. Command CRC shift register

The CRC polynomials for the CMD are as follows:

```
Generator polynomial: G(x) = x^7 + x^3 + 1
M(x) = (first bit) * x^n + (second bit) * x^n-1 +...+ (last bit) * x^0
CRC[6:0] = Remainder [(M(x) * x^7) / G(x)]
```

81.3.4.5 Data control

The data agent deals with the transactions on the eight data lines. Moreover, this module also detects the busy state on the DATA0 line and generates the read wait state by the request from the transceiver.

The CRC polynomials for the data are as follows:

```
Generator polynomial: G(x) = x^16 + x^12 + x^5 +1

M(x) = (first bit) * x^n + (second bit) * x^n-1 +...+ (last bit) * x^0

CRC[15:0] = Remainder [(M(x) * x^16) / G(x)]
```

81.3.5 Card insertion and removal detection

The uSDHC module uses the DATA3 pin to detect card insertion or removal. It is controlled by SoC pad or other logic. When there is no card on the eMMC/SD bus, the DATA3 is pulled to a low voltage level by default.

When any card is inserted to or removed from the socket, uSDHC detects the logic value changes on the DATA3 pin and generates an interrupt.

81.3.6 Power management and wakeup events

When there is no operation between uSDHC and the card through the SD bus, the user can completely disable the peripheral clock and base clock in the chip-level clock control module to save power. When the user needs to use uSDHC to communicate with the card, it can enable the clock and start the operation.

In some circumstances, when the clocks to uSDHC are disabled, for instance, when the system is in low-power mode, there are some events for which the user needs to enable the clock and handle the event. These events are called wakeup interrupts. The uSDHC module can generate these interrupts even when there are no clocks enabled. The three interrupts that can be used as wakeup events are these:

- Card removal interrupt
- Card insertion interrupt

- Interrupt from SDIO (not available in multiple block data transfers)

These three wakeup events (or wakeup interrupts) can also be used to wakeup the system from low-power modes.

NOTE

To make the interrupt a wakeup event, when all the clocks to uSDHC are disabled or when the entire system is in low power mode, the corresponding wakeup enabled bit needs to be set. Refer to Protocol Control (PROT_CTRL) for more information on the uSDHC Protocol Control register.

81.3.6.1 Setting wakeup events

For uSDHC to respond to a wakeup event, the software must set the respective wakeup enable bit before the CPU enters the sleep mode. Before the software disables the host clock, it should ensure that all the following conditions have been met:

- No read or write transfer is active
- Data and command lines are not active
- No interrupts are pending
- Internal data buffer is empty

81.3.7 eMMC fast boot

The Embedded MultiMediaCard (eMMC4.3 or later) specification adds a fast boot feature that requires hardware support. There are two types of fast boot modes in the eMMC4.3 or later specification: boot operation and alternative boot operation. Each type also has with-acknowledge and without-acknowledge modes.

In the boot operation mode, the master (eMultiMediaCard host) can read boot data from the slave (eMMC device) by keeping CMD line low after power-on, or sending CMD0 with argument + 0xFFFFFFFA (optional for slave), before issuing CMD1.

NOTE

For the eMMC4.3 setting, please see the eMMC4.3 specification.

81.3.7.1 Boot operation

If the CMD line is held low for 74 clock cycles and more after power-up before the first command is issued, the slave recognizes that boot mode is being initiated and starts preparing boot data internally.

Within one second after the CMD line goes low, the slave starts to send the first boot data to the master on the DATA line(s). The master must keep the CMD line low to read all of the boot data.

NOTE

For the purposes of this documentation, fast boot is called "normal fast boot mode".

If boot acknowledge is enabled, the slave has to send acknowledge pattern '010' to the master within 50ms after the CMD line goes low. If boot acknowledge is disabled, the slave does not send out acknowledge pattern '010'.

The master can terminate the boot mode with the CMD line high.

The boot operation is terminated when all the contents of the enabled boot data are sent to the master. After the boot operation is executed, the slave gets ready for the CMD1 operation and the master needs to start a normal eMMC initialization sequence by sending CMD1.

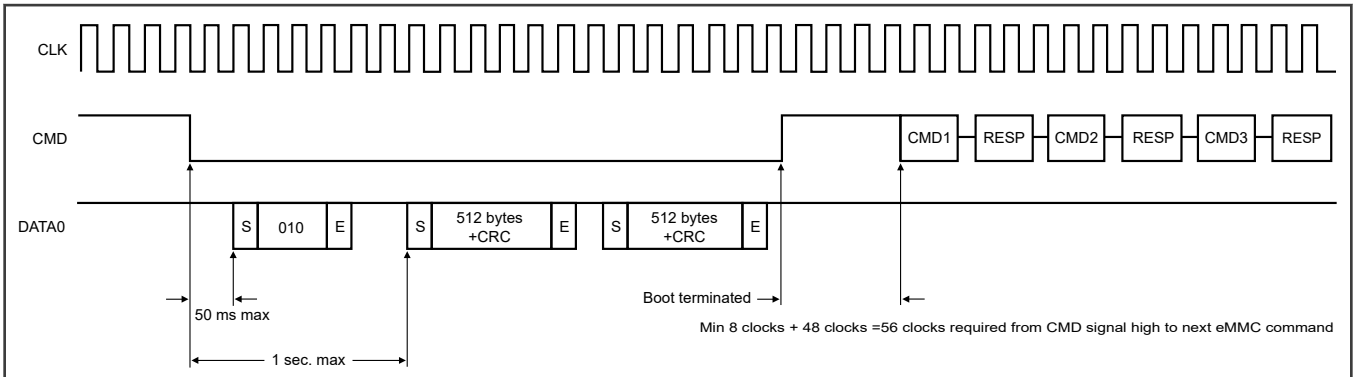

Figure 548. Embedded MultiMediaCard state diagram (normal boot mode)

81.3.7.2 Alternative boot operation

This boot function is optional for the device. If bit 0 in the extended CSD byte[228] is set to '1', the device supports the alternative boot operation.

After power-up, if the host issues CMD0 with the argument of 0xFFFFFFFA after 74 clock cycles, before CMD1 is issued or the CMD line goes low, the slave recognizes that boot mode is being initiated and starts preparing boot data internally.

Within one second after CMD0 with the argument of 0xFFFFFFFA is issued, the slave starts to send the first boot data to the master on the DATA line(s).

If boot acknowledge is enabled, the slave must send the acknowledge pattern '010' to the master within 50ms after the CMD0 with the argument of 0xFFFFFFFA is received. If boot acknowledge is disabled, the slave does not send out acknowledge pattern '010'.

The master can terminate the boot mode by issuing CMD0 (Reset).

Boot operation is terminated when all the contents of the enabled boot data are sent to the master. After the boot operation is executed, the slave gets ready for the CMD1 operation and the master needs to start a normal eMMC initialization sequence by sending CMD1.

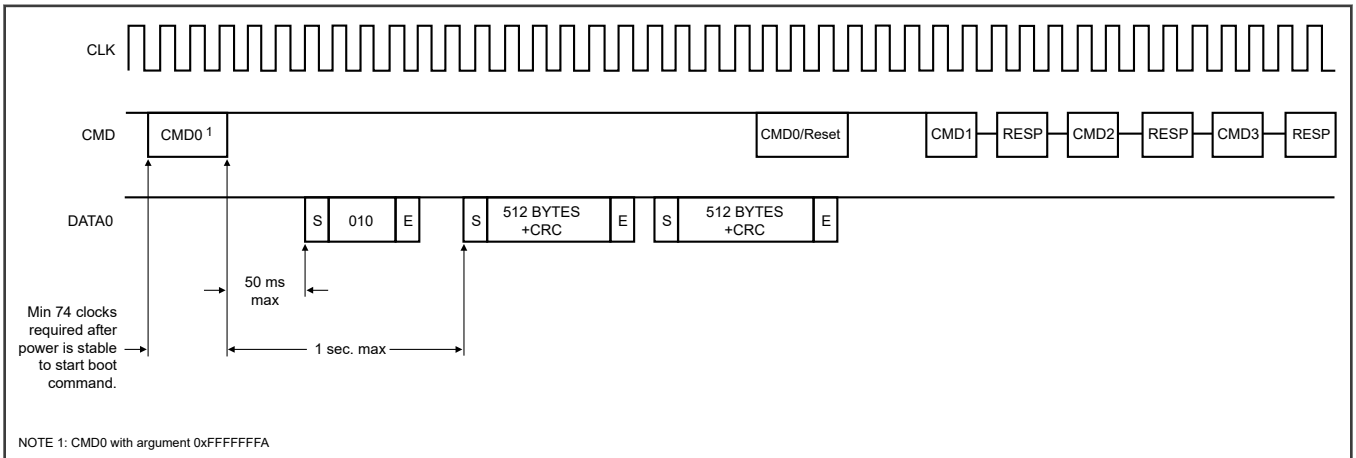

Figure 549. Embedded MultiMediaCard state diagram (alternative boot mode)

81.3.8 Commands for SD card, SDIO, and eMMC

A table containing the list of commands for the eMMC/SD card/SDIO is provided here.

Refer to the corresponding specifications for more details about the command information.

There are four kinds of commands defined to control the SD card, SDIO, and eMMC:

- Broadcast commands (bc), no response
- Broadcast commands with response (bcr), response from all cards simultaneously
- Addressed (point-to-point) commands (ac), no data transfer on the DATA
- Addressed (point-to-point) data transfer commands (adtc)

Response: A response is a token that is sent from the card to the host as an answer to a previously received command. A response is transferred serially on the CMD line.

Table 808. Commands for eMMC/SD card/SDIO

CMD INDEX	Type	Argument	Response type	Abbreviation	Description
CMD0	bc	[31:0] stuff bits	-	GO_IDLE_STATE	Resets all eMMC and SD memory cards to idle state.
CMD1	bcr	[31:0] OCR without busy	R3	SEND_OP_COND	Asks all eMMC and SD Memory cards in idle state to send their operation conditions register contents in the response on the CMD line.
CMD2	bcr	[31:0] stuff bits	R2	ALL_SEND_CID	Asks all cards to send their CID numbers on the CMD line.
CMD3[1]	ac	[31:6] RCA [15:0] stuff bits	R1 R6 (SDIO)	SET/ SEND_RELATIVE_ADDR	Assigns relative address to the card.
CMD4	bc	[31:0] DSR [15:0] stuff bits	-	SET_DSR	Programs the DSR of all cards.
CMD5	bc	[31:0] OCR without busy	R4	IO_SEND_OP_COND	Asks all SDIO in idle state to send them operation conditions register contents in the response on the CMD line.
CMD6[2]	adtc	[31] Mode 0: Check function 1: Switch function [30:8] Reserved for function groups 6 ~ 3 (All 0 or 0xFFFF) [7:4] Function group1 for command system [3:0] Function group2 for access mode	R1	SWITCH_FUNC	Checks switch ability (mode 0) and switch card function (mode 1). Refer to "SD Physical Specification V1.1" for more details.
CMD6[3]	ac	[31:26] Set to 0 [25:24] Access	R1b	SWITCH	Switches the mode of operation of the selected card or modifies the EXT_CSD registers. Refer to "The

Table continues on the next page...

Table 808. Commands for eMMC/SD card/SDIO (continued)

CMD INDEX	Type	Argument	Response type	Abbreviation	Description
		[23:16] Index [15:8] Value [7:3] Set to 0 [2:0] Cmd Set			Embedded MultiMediaCard System Specification Version 4.0 Final draft 2" for more details.
CMD7	ac	[31:6] RCA [15:0] stuff bits	R1b	SELECT/ DESELECT_CARD	Toggles a card between the stand-by and transfer states or between the programming and disconnect states. In both cases, the card is selected by its own relative address and gets deselected by any other address. Address 0 deselects all.
CMD8	adtc	[31:0] stuff bits	R1	SEND_EXT_CSD	The card sends its EXT_CSD register as a block of data, with a block size of 512 bytes.
CMD9	ac	[31:6] RCA [15:0] stuff bits	R2	SEND_CSD	Addressed card sends its card-specific data (CSD) on the CMD line.
CMD10	ac	[31:6] RCA [15:0] stuff bits	R2	SEND_CID	Addressed card sends its card-identification (CID) on the CMD line.
CMD11	adtc	[31:0] data address	R1	READ_DAT_UNTIL_STOP	Reads data stream from the card, starting at the given address, until a STOP_TRANSMISSION follows.
CMD12	ac	[31:0] stuff bits	R1b	STOP_TRANSMISSION	Forces the card to stop transmission.
CMD13	ac	[31:6] RCA [15:0] stuff bits	R1	SEND_STATUS	Addressed card sends its status register.
CMD14	Reserved				
CMD15	ac	[31:6] RCA [15:0] stuff bits	-	GO_INACTIVE_STATE	Sets the card to inactive state in order to protect the card stack against communication breakdowns.
CMD16	ac	[31:0] block length	R1	SET_BLOCKLEN	Sets the block length (in bytes) for all following block commands (read and write). Default block length is specified in the CSD.

Table continues on the next page...

Table 808. Commands for eMMC/SD card/SDIO (continued)

CMD INDEX	Type	Argument	Response type	Abbreviation	Description
CMD17	adtc	[31:0] data address	R1	READ_SINGLE_BLOCK	Reads a block of the size selected by the SET_BLOCKLEN command.
CMD18	adtc	[31:0] data address	R1	READ_MULTIPLE_BLOCK	Continuously transfers data blocks from card to host until interrupted by a stop command.
CMD19	Reserved				
CMD20	adtc	[31:0] data address	R1	WRITE_DAT_UNTIL_STOP	Writes data stream from the host, starting at the given address, until a STOP_TRANSMISION follows.
CMD21	Reserved				
CMD22	Reserved				
CMD23	ac	[31] reliable write request [30:16] set to 0 [15:0] number of blocks	R1	SET_BLOCK_COUNT	Defines the number of blocks (read/write) and the reliable writer parameter (write) for a block read or write command.
CMD24	adtc	[31:0] data address	R1	WRITE_BLOCK	Writes a block of the size selected by the SET_BLOCKLEN command.
CMD25	adtc	[31:0] data address	R1	WRITE_MULTIPLE_BLOCK	Continuously writes blocks of data until a STOP_TRANSMISSION follows.
CMD26	adtc	[31:0] stuff bits	R1	PROGRAM_CID	Programming of the card identification register. This command is issued only once per card. The card contains hardware to prevent this operation after the first programming. Normally this command is reserved for the manufacturer.
CMD27	adtc	[31:0] stuff bits	R1	PROGRAM_CSD	Programming of the programmable bits of the CSD.
CMD28	ac	[31:0] data address	R1b	SET_WRITE_PROT	If the card has write protection features, this command sets the write protection bit of the addressed group. The properties of write protection are coded in the card specific data (WP_GRP_SIZE).

Table continues on the next page...

Table 808. Commands for eMMC/SD card/SDIO (continued)

CMD INDEX	Type	Argument	Response type	Abbreviation	Description
CMD29	ac	[31:0] data address	R1b	CLR_WRITE_PROT	If the card provides write protection features, this command clears the write protection bit of the addressed group.
CMD30	adtc	[31:0] write protect data address	R1	SEND_WRITE_PROT	If the card provides write protection features, this command asks the card to send the status of the write protection bits.
CMD31	Reserved				
CMD32	ac	[31:0] data address	R1	TAG_SECTOR_START	Sets the address of the first sector of the erase group.
CMD33	ac	[31:0] data address	R1	TAG_SECTOR_END	Sets the address of the last sector in a continuous range within the selection of a single sector to be selected for erase.
CMD34	ac	[31:0] data address	R1	UNTAG_SECTOR	Removes one previously selected sector from the erase selection.
CMD35	ac	[31:0] data address	R1	TAG_ERASE_GROUP_START	Sets the address of the first erase group within a range to be selected for erase.
CMD36	ac	[31:0] data address	R1	TAG_ERASE_GROUP_END	Sets the address of the last erase group within a continuous range to be selected for erase.
CMD37	ac	[31:0] data address	R1	UNTAG_ERASE_GROUP	Removes one previously selected erase group from the erase selection.
CMD38	ac	[31:0] stuff bits	R1b	ERASE	Erase all previously selected sectors.
CMD39	ac	[31:0] RCA [15] register write flag [14:8] register address [7:0] register data	R4	FAST_IO	Used to write and read 8-bit (register) data fields. The command addresses a card, and a register, and provides the data for writing if the write flag is set. The R4 response contains data read from the address register. This command accesses application dependent registers which are not defined in the eMMC standard.

Table continues on the next page...

Table 808. Commands for eMMC/SD card/SDIO (continued)

CMD INDEX	Type	Argument	Response type	Abbreviation	Description
CMD40	bcr	[31:0] stuff bits	R5	GO_IRQ_STATE	Sets the system into interrupt mode.
CMD41	Reserved				
CDM42	adtc	[31:0] stuff bits	R1b	LOCK_UNLOCK	Used to set/reset the password or lock/unlock the card. The size of the data block is set by the SET_BLOCK_LEN command.
CMD43~51	Reserved				
CMD52	ac	[31:0] stuff bits	R5	IO_RW_DIRECT	Access a single register within the total 128k of register space in any I/O function.
CMD53	ac	[31:0] stuff bits	R5	IO_RW_EXTENDED	Accesses a multiple I/O register with a single command. Allows the reading or writing of a large number of I/O registers.
CMD54	Reserved				
CMD55	ac	[31:16] RCA [15:0] stuff bits	R1	APP_CMD	Indicates to the card that the next command is an application specific command rather than a standard command.
CMD56	adtc	[31:1] stuff bits [0]: RD/WR	R1b	GEN_CMD	Used either to transfer a data block to the card or to get a data block from the card for general purpose / application specific commands. The size of the data block is set by the SET_BLOCK_LEN command.
CMD57-59	Reserved				
CMD60	adtc	[31] WR [30:24] stuff bits [23:16] address [15:8] stuff bits [7:0] byte count	R1b	RW_MULTIPLE_REGISTER	These registers are used to control the behavior of the device and to retrieve status information regarding the operation of the device. All Status and Control registers are WORD (32-bit) in size and are WORD aligned. CMD60 is used to read and write these registers.
CMD61	adtc	[31] WR [30:16] stuff bits	R1b	RW_MULTIPLE_BLOCK	The host issues a RW_MULTIPLE_BLOCK (CMD61) to begin the data transfer.

Table continues on the next page...

Table 808. Commands for eMMC/SD card/SDIO (continued)

CMD INDEX	Type	Argument	Response type	Abbreviation	Description
		[15:0] data unit count			
CMD62-63	Reserved				
ACMD6[4]	ac	[31:2] stuff bits [1:0] bus width	R1	SET_BUS_WIDTH	Defines the data bus width ('00'=1bit or '10'=4bit bus) to be used for data transfer. The allowed data bus widths are given in SCR register.
ACMD13[4]	adtc	[31:0] stuff bits	R1	SD_STATUS	Send the SD Memory Card status.
ACMD22[4]	adtc	[31:0] stuff bits	R1	SEND_NUM_WR_SECTORS	Send the number of the written sectors (without errors). Responds with 32-bit plus the CRC data block.
ACMD23[4]	ac	[31:23] stuff bits [22:0] Number of blocks	R1	SET_WR_BLK_ERASE_COUNT	Set the number of write blocks to be pre-erased before writing (to be used for fast Multiple Block WR command). "1"=default(one write block).
ACMD41[4]	bcr	[31:0] OCR	R3	SD_APP_OP_COND	Asks the accessed card to send its operating condition register (OCR) contents in the response on the CMD line.
ACMD42[4]	ac	[31:1] stuff bits [0] set_cd	R1	SET_CLR_CARD_DETECT	Connect(1)/Disconnect(0) the 50KOhm pull-up resistor on DATA3 of the card.
ACMD51[4]	adtc	[31:0] stuff bits	R1	SEND_SCR	Reads the SD Configuration Register (SCR).

1. CMD3 differs for eMMC and SD cards. For eMMC, it is referred to as SET_RELATIVE_ADDR, with a response type of R1. For SD cards, it is referred to as SEND_RELATIVE_ADDR, with a response type of R6 (with RCA inside).
2. CMD6 differs completely between high speed eMMC and high-speed SD cards. Command SWITCH_FUNC is for high-speed SD cards.
3. Command SWITCH is for high speed eMMC. The Index field can contain any value from 0-255, but only values 0-191 are valid. If the Index value is in the 192-255 range the card does not perform any modification and the SWITCH_ERROR status bit in the EXT_CSD register is set. The Access Bits are shown in Table 809.
4. ACMDs is preceded with the APP_CMD command. Commands listed are used for SD only, other SD commands not listed are not supported on this module.

The access bits for the EXT_CSD access modes are listed in the following table.

Table 809. EXT_CSD access modes

Bits	Access name	Operation

Table continues on the next page...

Table 809. EXT_CSD access modes (continued)

00	Command set	The command set is changed according to the Cmd Set field of the argument.
01	Set bits	The bits in the pointed byte are set, according to the bits set to 1 in the Value field.
10	Clear bits	The bits in the pointed byte are cleared, according to the bits set to 1 in the Value field.
11	Write byte	The Value field is written into the pointed byte.

81.3.9 SDIO interrupt

Information on interrupts in 1-bit mode, interrupts in 4-bit mode, and card interrupt handling are detailed in the sections below.

81.3.9.1 Interrupts in 1-bit mode

In this case, the DATA1 pin provides the interrupt function. An interrupt is asserted by pulling the DATA1 low from SDIO, until the interrupt service is finished to clear the interrupt.

81.3.9.2 Interrupt in 4-bit mode

As the interrupt and data line 1 share pin 8 in a 4-bit mode, an interrupt is only sent by the card and recognized by the host during a specific time. This is known as the interrupt period. The uSDHC module only provides samples the level on pin 8 during the interrupt period. At all other times, the host treats it as the data signal. The definition of the interrupt period is different for operations with single block and multiple block data transfers.

In the case of normal single data block transmissions, the interrupt period becomes active two clock cycles after the completion of a data packet. This interrupt period lasts until after the card receives the end bit of the next command that has a data block transfer associated with it.

For multiple block data transfers in a 4-bit mode, there is only a limited period of time that the interrupt period can be active because of the limited period of data line availability between the multiple blocks of data. This requires stricter definition of the interrupt period. For this case, the interrupt period is limited to two clock cycles. This begins two clocks after the end bit of the previous data block. During this 2-clock cycle interrupt period, if an interrupt is pending, the DATA1 line holds low for one clock cycle, then pulls high for the next clock cycle . On completion of the interrupt period, the card releases the DATA1 line into the high Z state. The uSDHC module provides sample of the DATA1 during the interrupt period when the IABG bit in the Protocol Control register is set.

Refer to SDIO Specification v1.10 for further information about the SDIO interrupt.

81.3.9.3 Card interrupt handling

When the CINTIEN bit in the Interrupt Signal Enable Register is set to 0, uSDHC clears the interrupt request to the host system. The host driver should clear this bit before servicing the SDIO interrupt, and should set this bit again after all interrupt requests from the card are cleared to prevent inadvertent interrupts.

The SDIO Interrupt Status can be cleared by writing 1 to this bit. But as the interrupt source from SDIO does not clear, this bit is set again. To clear this bit, it is required to reset the interrupt source from the external card followed by writing 1 to this bit. In a 1-bit mode, uSDHC detects the SDIO interrupt with or without the SD clock (to support wakeup). In a 4-bit mode, the interrupt signal is sampled during the interrupt period, so there are some sample delays between the interrupt signal from SDIO and the interrupt to the Host System Interrupt Controller. When the SDIO status is set and the host driver needs to service this interrupt, the SDIO bit in the Interrupt Control Register of SDIO is cleared. This is required to clear the SDIO interrupt status latched in uSDHC and to stop driving the interrupt signal to the System Interrupt Controller. The host driver must issue a CMD52 to clear the card interrupt. After completion of the card interrupt service, the SDIO Interrupt Status Enable bit is set to 1 and uSDHC starts sampling the interrupt signal again.

See Figure 550 for an illustration of the SDIO interrupt scheme and for the sequences of software and hardware events that take place during a card interrupt handling procedure.

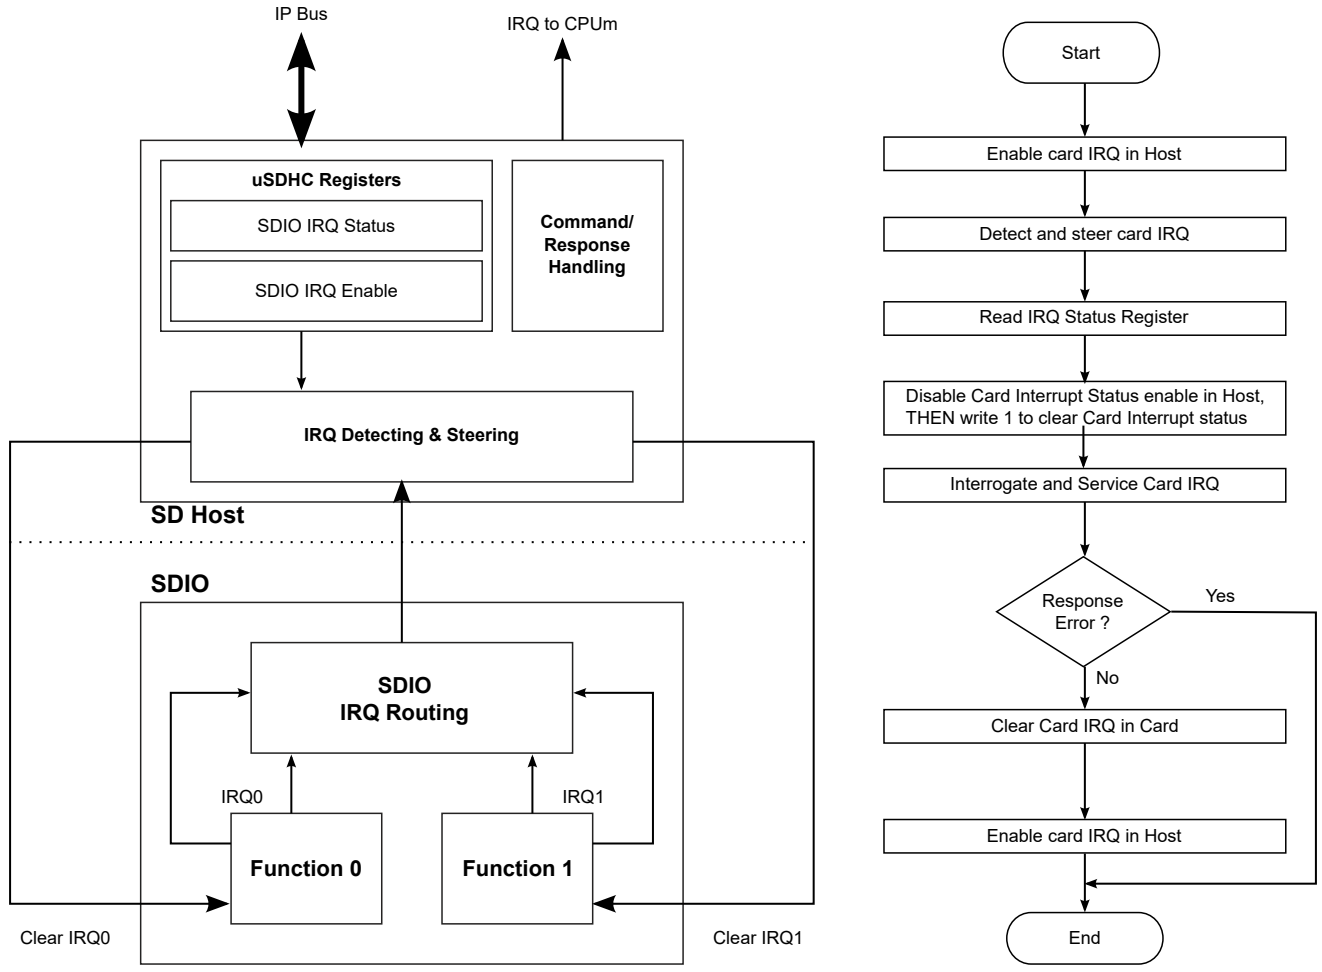

Figure 550. Card interrupt scheme, card interrupt detection, and handling procedure

81.3.10 Software restrictions

81.3.10.1 Initialization active

The driver cannot set INITA bit in System Control register when any of the command line or data lines are active, so the driver must ensure both CDIHB and CIHB bits are cleared.

81.3.10.2 Software polling procedure

For polling read or write, after the software begins a buffer read or write, it must access exactly the number of times as the values set in the Watermark Level Register; moreover, if the block size is not a multiple of the value in the Watermark Level Register (read and write respectively), the software must access exactly the remaining number of words at the end of each block. For example, for a read operation, if the RD_WML is 4, indicating the watermark level is 16 bytes, block size is 40 bytes, and the block number is 2, then the access times for the burst sequence in the whole transfer process must be 4, 4, 2, 4, 4, 2.

81.3.10.3 Suspend operation

To suspend the data transfer, the software must inform uSDHC that the suspend command is successfully accepted. To achieve this, after the Suspend command is accepted by SDIO, software must send another normal command marked as suspend command (CMDTYP bits set as '01') to inform uSDHC that the transfer is suspended.

If software needs to resume the suspended transfer, it should read the value in BLKCNT register to save the remaining number of blocks before sending the normal command marked as suspend, otherwise on sending such a 'suspend' command, uSDHC treats the current transfer is aborted and change the BLKCNT register to its original value, instead of retaining the remaining number of blocks.

81.3.10.4 Data length setting

For either ADMA (ADMA1 or ADMA2) transfer, the data in the data buffer must be word aligned, so the data length set in the descriptor must be a multiple of 4.

ADMA1 is 4KB aligned.

81.3.10.5 (A)DMA address setting

To configure the ADMA1/ADMA2/DMA address register, when TC bit is set, the register always updates itself with the internal address value to support dynamic address synchronization, so the software must ensure that the TC bit is cleared prior to configuring the ADMA1/ADMA2/DMA address register.

81.3.10.6 Data port access

Data port does not support parallel access. For example, during an internal DMA access, it is not allowed to write any data to the data port by CPU; or during a CPU read operation, it is also prohibited to write any data to the data port, by either CPU or internal DMA. Otherwise the data is corrupted inside the uSDHC buffer.

81.3.10.7 Change clock frequency

The uSDHC module does not automatically gate off the card clock when the host driver changes the clock frequency. To prevent possible glitch on the card clock, clear the FRC_SDCLK_ON bit when changing the clock divisor value (SDCLKFS or DVS in System Control Register) or setting the RSTA bit.

Also, before changing the clock divisor value, the host driver should make sure that the SDSTB bit is high.

81.3.10.8 Multi-block read

For pre-defined multi-block read operation, that is, the number of blocks to read has been defined by previous CMD23 for eMMC, or pre-defined number of blocks in CMD53 for SDIO/SDCombo, or whatever multi-block read without abort command at card side, an abort command, either automatic or manual CMD12/CMD52, is still required by uSDHC after the pre-defined number of blocks are done, to drive the internal state machine to idle mode. In this case, the card may not respond to this extra abort command and uSDHC gets response timeout. It is recommended to manually send an abort command with RSPTYP[1:0] both bits cleared.

81.3.11 Clocking

The table found here describes the clock sources for uSDHC. For more information on clocking, see the Clocking chapter.

Table 810. Clocks

Clock name	Description
hclk	Bus clock
ipg_clk	Peripheral clock
ipg_clk_perclk	Base clock
ipg_clk_lp	Low power clock

81.3.11.1 Clock and reset manager

This module controls all four kinds reset signals within uSDHC:

- Hardware reset
- Software reset for all logic
- Software reset for the data logic
- Software reset for the command logic

All these signals are fed into this module and stable signals are generated inside the module to reset all other modules. The module also gates off all the inside signals.

81.3.11.2 Clock generator

The clock generator generates the card CLK by peripheral source clock in two stages. The clock divisor can be configured through register SYS_CTRL[SDCLKFS] for prescaler configuration while the [DVS] for divisor configuration. Details can be found in the register function description. See the following figure for the structure of the divider. The term "Base" represents the frequency of peripheral source clock (see ipg_clk_perclk in Table 810).

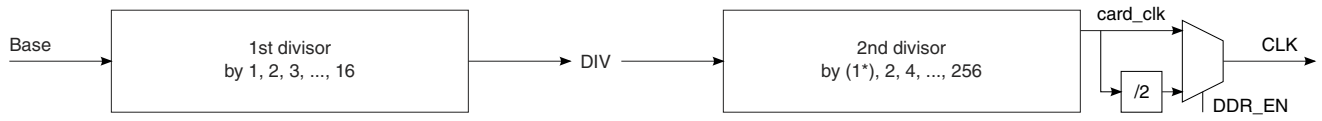

Figure 551. Two stages of the clock divider

The first stage outputs an intermediate clock (DIV) that can be Base, Base/2, Base/3, ..., or Base/16.

The second stage is a prescaler and outputs the actual internal working clock (card_clk). This clock is the driving clock for all the sub modules of the SD protocol unit, and helps in syncing FIFOs (see Figure 537) to synchronize with the data rate from the internal data buffer. The frequency of the clock output from this stage can be DIV, DIV/2, DIV/4,..., or DIV/256. Therefore, the highest frequency of the card_clk is base, and the next highest is Base/2, while the lowest frequency is Base/4096. If the duty cycle of the base clock is 50%, the duty cycle of card_clk is also 50%, even when the compound divisor is an odd value.

NOTE

CLK is different for the SDR and DDR modes.

- In the SDR mode, CLK is equal to the internal working clock (card_clk).

$$f_{card\_clk} = \frac{f_{Base}}{SYS\_CTRL[DVS] \times SYS\_CTRL[SDCLKFS]}$$

$$f_{CLK} = f_{card\_clk}$$

Equation 32. Equation for f_{card_clk} in SDR mode

$$f_{card\_clk} = \frac{400MHz}{1x(2)} = 200MHz$$

$$f_{CLK} = f_{card\_clk} = 200\ MHz$$

- In the DDR mode, CLK is equal to card_clk/2

$$f_{card\_clk} = \frac{f_{Base}}{SYS\_CTRL[DVS] \times (SYS\_CTRL[SDCLKFS]/2)}$$

$$f_{CLK} = \frac{f_{card\_clk}}{2}$$

Equation 33. Equation for f_{card_clk} in DDR mode

$$f_{card\_clk} = \frac{400MHz}{1x(2/2)} = 400MHz$$

$$f_{CLK} = \frac{f_{card\_clk}}{2} = \frac{400MHz}{2} = 200MHz$$

81.4 External signals

The following table describes the uSDHC external signals:

Table 811. uSDHC external signals

Signal	Description	Direction
CLK	Is an Internally generated clock used to drive the eMMC, SD card, and SDIO.	O
CMD	Is used to send commands and receive responses to and from the card.	I/O
DAT7	DAT7 line in the 8-bit mode — Not used in other modes	I/O
DAT6	DAT6 line in the 8-bit mode — Not used in other modes	I/O
DAT5	DAT5 line in the 8-bit mode — Not used in other modes	I/O
DAT4	DAT4 line in the 8-bit mode — Not used in other modes	I/O
NOTE If uSDHC needs to support a 4-bit data transfer, DAT7~DAT4 can also be optional and tied to high.		
DAT3	DAT3 line in the 4/8-bit mode or configured as card detection pin. The bit may be configured as card detection pin in the 1-bit mode.	I/O
DAT2	DAT2 line or Read Wait in the 4-bit mode Read Wait in 1-bit mode	I/O
DAT1	DAT1 line in the 4/8-bit mode Also, used to detect interrupt in 1/4-bit mode	I/O
DAT0	DAT0 line in all the modes	I/O

Table continues on the next page...

Table 811. uSDHC external signals (continued)

Signal	Description	Direction
	Also, used to detect busy state	
WP	Write protection signals directly routed from the socket. Low value (0) indicates it is not write protected. In the case the pin is not used (for the embedded memory), tie low. Optional for system implementation.	I
RESET_B	Is used to reset the eMMC.	O

81.5 Application information

All communication between the system and cards are controlled by the host. The host sends commands of two types: broadcast and addressed (point-to-point).

Broadcast commands are intended for all cards, such as GO_IDLE_STATE, SEND_OP_COND, and ALL_SEND_CID. In the Broadcast mode, eMMC are in the open-drain mode to avoid bus contention. See Commands for SD card, SDIO, and eMMC for the commands of bc and bcr categories.

After the broadcast command CMD3 is issued, the cards enter the standby mode. Addressed type commands are used from this point. In this mode, for eMMC, the CMD/DATA I/O pads turns to the push-pull mode to have the driving capability for maximum frequency operation. See Commands for SD card, SDIO, and eMMC for the commands of ac and adtc categories.

81.5.1 Command send and response receive basic operation

Assuming that the data type WORD is an unsigned 32-bit integer, the flow indicated below presents a guideline for sending a command to the card(s):

```
send_command(cmd_index, cmd_arg, other requirements)

{

    WORD wCmd; // 32-bit integer to make up the data to write into Transfer Type register, it is
recommended to implement in a bit-field manner

    wCmd = (<cmd_index> & 0x3f) << 24; // set the first 8 bits as '00'+<cmd_index>

    set CMDTYP, DPSEL, CICEN, CCCEN, RSTTYP, DTDSEL according to the command index;

    if (internal DMA is used) wCmd |= 0x1;

    if (multi-block transfer) {

        set MSBSEL bit;

        if (finite block number) {

            set BCEN bit;

            if (auto12 command is to use) set AC12EN bit;

        }

    }
```

```
    write_reg(CMDARG, <cmd_arg>); // configure the command argument

    write_reg(XFERTYP, wCmd); // set Transfer Type register as wCmd value to issue the command

}

wait_for_response(cmd_index)

{

    while (CC bit in IRQ Status register is not set); // wait until Command Complete bit is set

    read IRQ Status register and check if any error bits about Command are set

    if (any error bits are set) report error;

    write 1 to clear CC bit and all Command Error bits;

}
```

For the sake of simplicity, the function wait_for_response is implemented here by means of polling. For an effective and formal way, the response is usually checked after the Command Complete Interrupt is received. When doing this, make sure that the corresponding interrupt status bits are enabled.

For some scenarios, the response time-out is expected. For instance, after all cards respond to CMD3 and move to the Standby state no response to the Host when CMD2 is sent. The host driver deals with "fake" errors like this with caution.

81.5.2 Card identification mode

When a card is inserted to the socket or the card is reset by the host, the host needs to validate the operation voltage range, identify the cards, request the cards to publish the Relative Card Address (RCA) or to set the RCA for eMMC.

81.5.2.1 Card detect

See Figure 552 for a flow diagram showing the detection of SD card and SDIO using uSDHC.

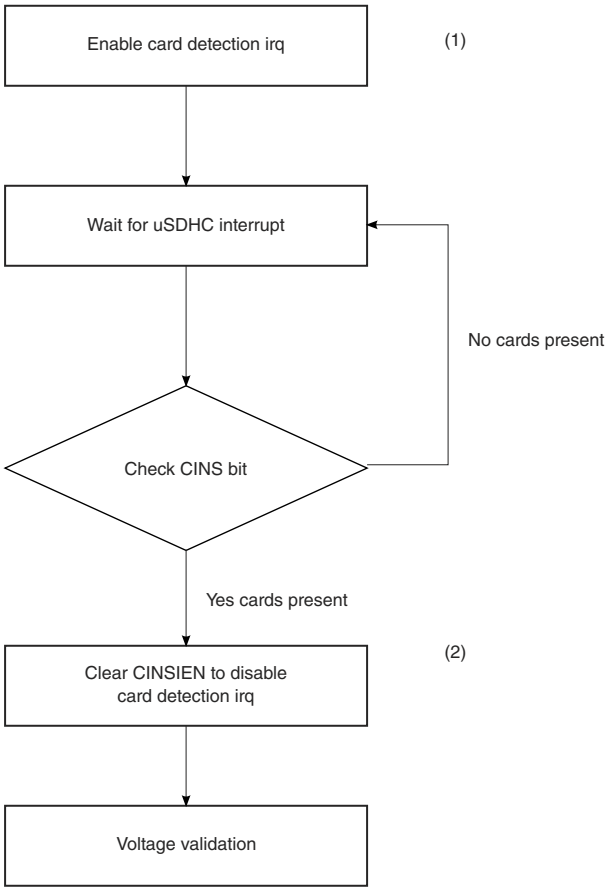

Figure 552. Flow diagram for card detection

Here is the card detect sequence:

- Set the CINSIEN bit to enable card detection interrupt.
- When an interrupt from uSDHC is received, check the CINS bit in the Interrupt Status register to see if it was caused by card insertion.
- Clear the CINSIEN bit to disable the card detection interrupt and ignore all card insertion interrupts afterwards.

81.5.2.2 Reset

The host consists of three types of resets:

- Hardware reset (Card and Host) that is driven by Power On Reset (POR).
- Software reset (Host only) is initiated by the write operation on the RSTD, RSTC, or RSTA bits of the System Control register to reset the data part, command part, or all parts of the host controller, respectively.
- Card reset (Card only): The command, "Go_Idle_State" (CMD0), is the software reset command for all types of eMMC and SD memory cards. This command sets each card into the idle state regardless of the current card state. For an SDIO, CMD52 is used to write an I/O reset in CCCR. The cards are initialized with a default relative card address (RCA=0x0000) and with a default driver stage register setting (lowest speed, highest driving current capability).

After the card is reset, the host needs to validate the voltage range of the card. See the figure below for the software flow to reset both uSDHC and the card.

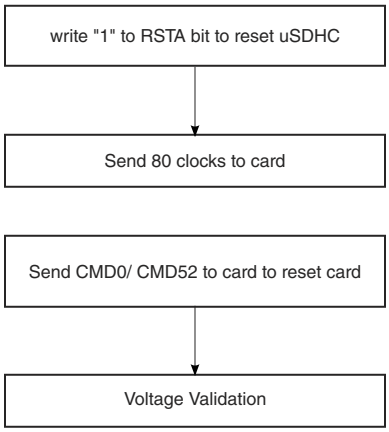

Figure 553. Flow chart for resetting uSDHC and SD card or SDIO

```
software_reset() {
    set_bit(SYSCTRL, RSTA); // software reset the Host set DTOCV and SDCLKFS fields to get the CLK of
    //frequency around 400kHz
    //configure IO pad to set the power voltage of external card to around 3.0V
    //poll bits CIHB and CDIHB
    //bits of PRSSTAT to wait both fields are cleared
    set_bit(SYSCTRL, INTIA); // send 80 clock ticks for card to power up
    send_command(CMD_GO_IDLE_STATE, <other parameter>); // reset the card with CMD0 or
    send_command(CMD_IO_RW_DIRECT, <other parameter>);
}
```

81.5.2.3 Voltage validation

All cards should be able to establish communication with the host using any operation voltage in the maximum allowed voltage range specified in the card specification. However, the supported minimum and maximum values for VDD are defined in the Operation Conditions Register (OCR) and may not cover the whole range. Cards that store the CID and CSD data in the preload memory are only able to communicate this information under data transfer VDD conditions. This means that if the host and card have non-common VDD ranges, the card is neither able to complete the identification cycle nor able to send CSD data.

Therefore, special commands Send_Op_Cont (CMD1 for eMMC), SD_Send_Op_Cont (ACMD41 for SD Memory), and IO_Send_Op_Cont (CMD5 for SD I/O) are used. The voltage validation procedure is designed to provide a mechanism to identify and reject cards that do not match the VDD range(s) desired by the host. This is accomplished when the host sends the desired VDD voltage window as the operand of this command. Cards that cannot perform the data transfer in the specified range must discard themselves from further bus operations and go into the Inactive state. By omitting the voltage range in the command, the host can query each card and determine the common voltage range before sending out-of-range cards into the Inactive state. This query should be used if the host is able to select a common voltage range or if a notification is sent to the system when a non-usable card in the stack is detected.

The following steps show how to perform voltage validation when a card is inserted:

```
voltage_validation(voltage_range_argument) {
    label the card as UNKNOWN;
    send_command(IO_SEND_OP_COND, 0x0, <other parameters are omitted>); // CMD5, check SDIO operation
voltage, command argument is zero
    if (RESP_TIMEOUT != wait_for_response(IO_SEND_OP_COND)) { // SDIO command is accepted
        if (0 < number of IO functions) {
            label the card as SDIO;
            IORDY = 0;
```

```
            while (!(IORDY in IO OCR response)) { // set voltage range for each IO function
                send_command(IO_SEND_OP_COND, <voltage range>, <other parameter>);
                wait_for_response(IO_SEND_OP_COND);
            } // end of while ...
        } // end of if (0 < ...
        if (memory part is present inside SDIO)
            Label the card as SDCombo; //this is an SD-Combo card
    } // end of if (RESP_TIMEOUT ...
    if (the card is labeled as SDIO)
        return; // card type is identified and voltage range is set, so exit the function;
    send_command(APP_CMD, 0x0, <other parameter>); // CMD55, Application specific CMD prefix
    if (no error calling wait_for_response(APP_CMD, <...>) { // CMD55 is accepted
        send_command(SD_APP_OP_COND, <voltage range>, <...>); // ACMD41, to set voltage range for
memory part or SD card
        wait_for_response(SD_APP_OP_COND); // voltage range is set
        if (card type is UNKNOWN)
           label the card as SD;
        return; //
    } // end of if (no error ...
    else if (errors other than time-out occur) { // command/response pair is corrupted
        deal with it by program specific manner;
    } // of else if (response time-out
    else { // CMD55 is refuse, it must be eMMC
        if (card is already labeled as SDCombo) { // change label
            re-label the card as SDIO;
            ignore the error or report it;
            return; // card is identified as SDIO
        } // end of if (card is ...
        send_command(SEND_OP_COND, <voltage range>, <...>);
        if(RESP_TIMEOUT == wait_for_response(SEND_OP_COND)) { // CMD1 is not accepted,
            either label the card as UNKNOWN;
            return;
        } // end of if (RESP_TIMEOUT ...
    } // end of else
}
```

81.5.2.4 Card registry

This section briefly describes the registry flow. For details, please refer to the card specifications. Card registry for the eMMC and SD/SDIO/SD combo cards are different. For the SD card, the identification process starts at a clock rate lower than 400 kHz and the power voltage higher than 2.7 V (as defined by the card spec). Currently, the CMD line output drives are push-pull drivers instead of open-drain. After the bus is activated, the host requests the card to send their valid operation conditions. The response to ACMD41 is the operation condition register of the card. The same command is sent to all the new cards in the system. Incompatible cards are put into the Inactive state. The host then issues the command, All_Send_CID (CMD2), to each card to get its unique card identification (CID) number. Cards that are currently unidentified (in the Ready state), send their CID number as the response. After the CID is sent by the card, the card goes into the Identification state.

The host then issues Send_Relative_Addr (CMD3), requesting the card to publish a new relative card address (RCA) that is shorter than the CID. This RCA is used to address the card for future data transfer operations. After the RCA is received, the card changes its state to the Standby state. At this point, if the host wants the card to have an alternative RCA number, it may ask the card to publish a new number by sending another Send_Relative_Addr command to the card. The last published RCA is the actual RCA of the card.

The host repeats the identification process with CMD2 and CMD3 for each card in the system until the last CMD2 gets no response from any of the cards in the system.

For eMMC operation, the host starts the card identification process in the open-drain mode with the identification clock rate lower than 400 kHz and the power voltage higher than 2.7 V. The open drain driver stages on the CMD line to allow parallel card operation during card identification. After the bus is activated, the host requests the cards to send their valid operation conditions

(CMD1). The response to CMD1 is the "wired AND " operation on the condition restrictions of all cards in the system. Incompatible cards are sent into the Inactive state. The host then issues the broadcast command All_Send_CID (CMD2), asking all cards for their unique card identification (CID) number. All unidentified cards (the cards in the Ready state) simultaneously start sending their CID numbers serially, while bit-wise monitoring their outgoing bit stream. Those cards, whose outgoing CID bits do not match the corresponding bits on the command line in any one of the bit periods, stop sending their CID immediately and must wait for the next identification cycle. As the CID is unique for each card, only one card can be successfully sent its full CID to the host. This card then goes into the Identification state. Thereafter, the host issues Set_Relative_Addr (CMD3) to assign a relative card address (RCA) to the card. After the RCA is received, the state of the card changes to standby, and the card does not react in further identification cycles. Also, its output driver switches from open-drain to push-pull. The host repeats the process, mainly CMD2 and CMD3, until the host receives a time-out condition to recognize the completion of the identification process.

The following steps show how to perform an operation using eMMC:

```
card_registry() {
    do { // decide RCA for each card until response time-out
        if(card is labelled as SDCombo or SDIO) { // for SDIO like device
            send_command(SET_RELATIVE_ADDR, 0x00, <...>); // ask SDIO to publish its RCA
            retrieve RCA from response;
        } // end if (card is labelled as SDCombo ...
        else if (card is labelled as SD) { // for SD card
            send_command(ALL_SEND_CID, <...>);
            if(RESP_TIMEOUT == wait_for_response(ALL_SEND_CID))
                break;
            send_command(SET_RELATIVE_ADDR, <...>);
            retrieve RCA from response;
        } // else if (card is labelled as SD ...
        else if (card is labelled as eMMC) {
            send_command(ALL_SEND_CID, <...>);
            rca = 0x1; //arbitrarily set RCA, 1 here for example
            send_command(SET_RELATIVE_ADDR, 0x1 << 16, <...>); // send RCA at upper 16 bits
        } // end of else if (card is labelled as eMMC...
    } while (response is not time-out);
}
```

81.5.3 Card access

Information about Block Write, Block Read, Suspense Resume, ADMA Usage, Transfer Error, and Card Interrupt are detailed in the sections below.

81.5.3.1 Block write

Information on Normal Write, DDR Write, and Write with Pause are detailed in the sections below.

81.5.3.1.1 Normal Write

During a block write (CMD24 - 27, CMD60, CMD61), one or more blocks of data are transferred from the host to the card with a CRC appended to the end of each block by the host. If the CRC fails, the card indicates that the failure on the DATA line. The transferred data is discarded and not written, and all further transmitted blocks (in multiple block write mode) are ignored.

If the host uses partial blocks whose accumulated length is not block aligned and block misalignment is not allowed (CSD parameter WRITE_BLK_MISALIGN is not set), the card detects the block misalignment error and aborts the programming before the beginning of the first misaligned block. The card sets the ADDRESS_ERROR error bit in the status register, and while ignoring all further data transfer, waits in the Receive-data-State for a stop command. The write operation is also aborted if the host tries to write over a write-protected area.

For eMMC and SD cards, programming of the CID and CSD registers does not require a previous block length setting. The transferred data is also CRC protected. If a part of the CSD or CID register is stored in ROM, then this unchangeable part must match the corresponding part of the receive buffer. If this match fails, then the card reports an error and does not change any register contents.

For all types of cards, some may require long and unpredictable periods of time to write a block of data. After receiving a block of data and completing the CRC check, the card begins writing and holds the DATA line low if its write buffer is full and unable to accept new data from a new WRITE_BLOCK command. The host may poll the status of the card with a SEND_STATUS command (CMD13) or other means for SDIO at any time, and the card responds with its status. The responded status indicates whether the card can accept new data or whether the write process is still in progress. The host may deselect the card by issuing a CMD7 (to select a different card) to place the card into the Standby state and release the DATA line without interrupting the write operation. When re-selecting the card, it reactivates the busy indication by pulling data to low if the programming is still in progress and the write buffer is unavailable.

The software flow to write to a card that incorporates the internal DMA and the write operation is a multi-block write with the Auto CMD12 enabled. For the other two methods (by means of external DMA or CPU polling status with different transfer methods, the internal DMA parts should be removed and the alternative steps should be straightforward.

The software flow to write to a card is described below:

1. Check the card status, wait until the card is ready for data.
2. Set the card block length/size:
   - For eMMC and SD cards, use SET_BLOCKLEN (CMD16).
   - For SDIO cards or the I/O portion of SDCombo cards, use IO_RW_DIRECT (CMD52) to set the I/O Block Size bit field in the CCCR register (for function 0) or FBR register (for functions 1~7).
3. Set the uSDHC block length register to be the same as the block length set for the card in step 2.
4. Set the uSDHC number block register (NOB), where nob is 5, for instance.
5. Disable the buffer write ready interrupt, configure the DMA settings and enable the uSDHC DMA when sending the command with data transfer. The AC12EN bit should also be set.
6. Wait for the Transfer Complete interrupt.
7. Check the status bit to see if a write CRC error occurred, or another error that occurred during the auto12 command sending and response receiving.

81.5.3.1.2 DDR write

uSDHC supports the dual data rate mode.

The software flow to write to a card in the DDR mode is described as below:

1. Check the card status and wait until the card is ready for data.

NOTE

For eMMC, block length only can be set to 512byte.

2. Set the uSDHC number block register (NOB), where nob is 5, for instance.
3. Set the eMMC, SD card, or SDIO to high-speed mode and use SWITCH(CMD6).
4. Set the eMMC bus or SD with 4-bit/8-bit DDR mode and use SWITCH(CMD6).
5. Disable the buffer write ready interrupt, configure the DMA settings and enable the uSDHC DMA when sending the command with data transfer. The DDR_EN and AC12EN bits should be set.
6. Wait for the Transfer Complete interrupt.
7. Check the status bit to see if a write CRC error occurred or another error that occurred during the auto12 command sending and response receiving.

81.5.3.1.3 Write with Pause

The write operation can be paused during the transfer. Instead of stopping the CLK at any time to pause all the operations, which is also inaccessible to the host driver, the driver can set the Stop At Block Gap Request (SABGREQ) bit in the Protocol

Control register to pause the transfer between the data blocks. As there is no time-out condition in a write operation during the data blocks, a write to all types of cards can be paused in this way, and if the DATA0 line is not required to de-assert to release the busy state, no suspend command is needed.

Similar to the flow described in Normal Write, the write with pause is shown with the same kind of write operation:

1. Check the card status and wait until the card is ready for data.
2. Set the card block length/size:
   - For eMMC and SD cards, use SET_BLOCKLEN (CMD16).
   - For SDIO or the I/O portion of SDCombo cards, use IO_RW_DIRECT(CMD52) to set the I/O Block Size bit field in the CCCR register (for function 0) or FBR register (for functions 1~7).
3. Set the uSDHC block length register to be the same as the block length set for the card in step 2.
4. Set the uSDHC number block register (NOB), where nob is 5, for instance.
5. Disable the buffer write ready interrupt, configure the DMA settings and enable the uSDHC DMA when sending the command with data transfer. The AC12EN bit should also be set.
6. Set the SABGREQ bit.
7. Wait for the Transfer Complete interrupt.
8. Clear the SABGREQ bit.
9. Check the status bit to see if a write CRC error occurred.
10. Set the CREQ bit to continue the write operation.
11. Wait for the Transfer Complete interrupt.
12. Check the status bit to see if a write CRC error occurred or some another error that occurred during the auto12 command sending and response receiving.

The number of blocks left during the data transfer is accessible by reading the contents of the BLKCNT field in the Block Attribute register. As the data transfer and the setting of the SABGREQ bit are concurrent, and the delay of register read and the register setting, the actual number of blocks left may not be exactly the value read earlier. The host driver reads the value of BLKCNT after the transfer is paused and the Transfer Complete interrupt is received.

It is also possible that the last block has begun when the Stop At Block Gap Request is sent to the buffer. In this case, the next block gap is the end of the transfer. These types of requests are ignored, the driver should treat these as a non-pause transfer, and deal with it as a common write operation.

When the write operation is paused, the data transfer inside the host system is not stopped, and the transfer is active until the data buffer is full. Because of this, it is recommended to avoid using the Suspend command for SDIO. This is because when such a command is sent, uSDHC interprets the system that switches to another function on SDIO and flush the data buffer. uSDHC takes the Resume command as a normal command with data transfer, and it is left for the host driver to set all the relevant registers before the transfer is resumed. If there is only one block to send when the transfer is resumed, the MSBSEL and BCEN bits of the Transfer Type register are set as well as the AC12EN bit. However, the uSDHC module automatically sends a CMD12 to mark the end of the multi-block transfer.

81.5.3.2 Block read

Information about Normal read, DDR read, Read with Pause, and Delay Line (DLL) in Read Path are detailed in the sections below.

81.5.3.2.1 Normal read

For block reads, the basic unit of data transfer is a block whose maximum size is stored in areas defined by the corresponding card specification. A CRC is appended to the end of each block, ensuring data transfer integrity. The CMD17, CMD18, CMD53, CMD60, CMD61, and so on, can initiate a block read. After completing the transfer, the card returns to the Transfer state. For multi blocks read, data blocks are continuously transferred until a stop command is issued.

The software flow to read from a card that incorporates the internal DMA and the read operation is a multi-block read with the Auto CMD12 enabled. For the other two methods (by means of external DMA or CPU polling status with different transfer methods, the internal DMA parts should be removed and the alternative steps should be straightforward.

The software flow to read from a card is described below:

1. Check the card status and wait until card is ready for data.
2. Set the card block length/size:
   - For eMMC and SD cards, use SET_BLOCKLEN (CMD16).
   - For SDIO or the I/O portion of SDCombo cards, use IO_RW_DIRECT(CMD52) to set the I/O Block Size bit field in the CCCR register (for function 0) or FBR register (for functions 1~7).
3. Set the uSDHC block length register to be the same as the block length set for the card in step 2.
4. Set the uSDHC number block register (NOB), where nob is 5, for instance.
5. Disable the buffer read ready interrupt, configure the DMA settings, and enable the uSDHC DMA when sending the command with data transfer. The AC12EN bit should also be set.
6. Wait for the Transfer Complete interrupt.
7. Check the status bit to see if a read CRC error occurred, or another error occurred during the auto12 command sending and response receiving.

81.5.3.2.2 DDR read

The uSDHC module supports dual data rate mode.

The software flow to write to a card in the DDR mode is described below:

1. Check the card status and wait until the card is ready for data.

NOTE

For eMMC, block length can be set to only 512 bytes.

2. Set the uSDHC number block register (NOB) where nob is 5, for instance.
3. Set the eMMC, SD card, or SDIO to high-speed mode and use SWITCH (CMD6).
4. Set the eMMC bus or SD with 4-bit /8-bit DDR mode and use SWITCH(CMD6).
5. Disable the buffer write ready interrupt, configure the DMA settings, and enable the uSDHC DMA when sending the command with data transfer. The DDR_EN and AC12EN bits should be set.
6. Wait for the Transfer Complete interrupt.
7. Check the status bit to see if a write CRC error occurred, or another error that occurred during the auto12 command sending and response receiving.

81.5.3.2.3 Read with Pause

The read operation is not generally able to pause. Only SDIO (and SDCombo card working under I/O mode) supporting the Read Wait feature can pause during the read operation. If SDIO supports Read Wait (SRW bit in CCCR register is 1), the host driver can set the SABGREQ bit in the Protocol Control register to pause the transfer between the data blocks. Before setting the SABGREQ bit, ensure that the RWCTL bit in the Protocol Control register is set, otherwise uSDHC does not assert the Read Wait signal during the block gap and data corruption occurs. It is recommended to set the RWCTL bit after the Read Wait capability of SDIO is recognized.

Similar to the flow described in Normal read, the read with pause is shown with the same kind of read operation:

1. Check the SRW bit in the CCR register on SDIO to confirm that the card supports the Read Wait mode.
2. Set the RWCTL bit.

3. Check the card status and wait until the card is ready for data.
4. Set the card block length/size:
   - For eMMC and SD cards, use SET_BLOCKLEN (CMD16).
   - For SDIO or the I/O portion of SDCombo cards, use IO_RW_DIRECT(CMD52) to set the I/O Block Size bit field in the CCCR register (for function 0) or FBR register (for functions 1~7).
5. Set the uSDHC block length register to be the same as the block length set for the card in step 2.
6. Set the uSDHC number block register (NOB), where nob is 5, for instance.
7. Disable the buffer read ready interrupt, configure the DMA setting, and enable the uSDHC DMA when sending the command with data transfer. The AC12EN bit should also be set.
8. Set the SABGREQ bit.
9. Wait for the Transfer Complete interrupt.
10. Clear the SABGREQ bit.
11. Check the status bit to see if read CRC error occurred.
12. Set the CREQ bit to continue the read operation.
13. Wait for the Transfer Complete interrupt.
14. Check the status bit to see if a read CRC error occurred, or another error occurred during the auto12 command sending and response receiving.

Similar to the Write operation, it is possible to meet the ending block of the transfer when paused. In this case, uSDHC ignores the Stop At Block Gap Request and treats it as a command read operation.

Unlike the write operation, there is no remaining data inside the buffer when the transfer is paused. All data received before the pause is transferred to the host system. No matter if the Suspend command is sent or not, the internal data buffer is not flushed.

If the Suspend command is sent and the transfer is later resumed by means of a Resume command, uSDHC takes the command as a normal one accompanied with data transfer. It is left for the host driver to set all the relevant registers before the transfer is resumed. If there is only one block to send when the transfer is resumed, the MSBSEL and BCEN bits of the Transfer Type register are set, as well as the AC12EN bit. However, the uSDHC automatically sends CMD12 to mark the end of multi-block transfer.

81.5.3.2.4 Delay Line (DLL) in read path

The DLL is newly added to assist in sampling read data. The DLL provides the ability to programmatically select a quantized delay (in fractions of the clock period) regardless of on-chip variations such as process, voltage, and temperature (PVT).

The reasons why DLL is needed for uSDHC are these:

- The path of read data traveling from card to host varies.
- In the eMMC and SD cards DDR mode, the minimum input setup and hold time are both at 2.5 ns.

The data sampling window is so small that the delay of loopback clock needs to be accurate and consistent regardless of PVT. The DLL takes the divided card_clk as the reference clock and loopback clock as the input clock. It then generates a delayed version of the input clock according to the programmed target delay.

The DLL can be disabled or bypassed, and it can also be manually set for a fixed delay in the override mode. The override value set is the number of delay cells. In the override mode, there is no need to set the DLL_enable. Another DLL mode is target value mode. In this mode, the DLL automatically adjusts the number of delay cells according to the target value set by the user and PVT changes. Be aware that the target value is in units of 1/32 of the clock reference period. If the card_clk is 100Mhz, then the reference clock period is 10ns; setting target value of 16 means 5ns =(16/32)*10ns. The software can disable automatic update by the setting dll_gate_update bit.

As you might change the frequency of card_clk from time to time by changing SDCLKFS[7:0]/DVS[3:0], the software must adjust the delay value to ensure it works correctly when the reference clock (card_clk) is changed. If DLL is to be used, make sure

SDCLKFS is used (at least be set to divided by 2) so that the REF_CLK generated are the same frequency as card_clk. There are two DLLs, PARTS DLL and STROBE DLL.

Step 1: Set the DLL_CTRL_RESET and DLL_CTRL_ENABLE fields

Step 2: Configure the SDCLKFS[7:0] and DVS[3:0]

Step 3: Wait until SDSTB is asserted

Step 4: Clear the DLL_CTRL_RESET field

Step 5: Wait until both the DLL_STS_SLV_LOCK and DLL_STS_REF_LOCK are asserted

Step 6: Set the DLL_CTRL_SLV_FORCE_UPD

Step 7: Clear the DLL_CTRL_SLV_FORCE_UPD

NOTE

The software should make sure that the DLL_CTRL_SLV_FORCE_UPD lasts for at least one card_clk. So, the software may need to add some delay between step 6 and step 7.

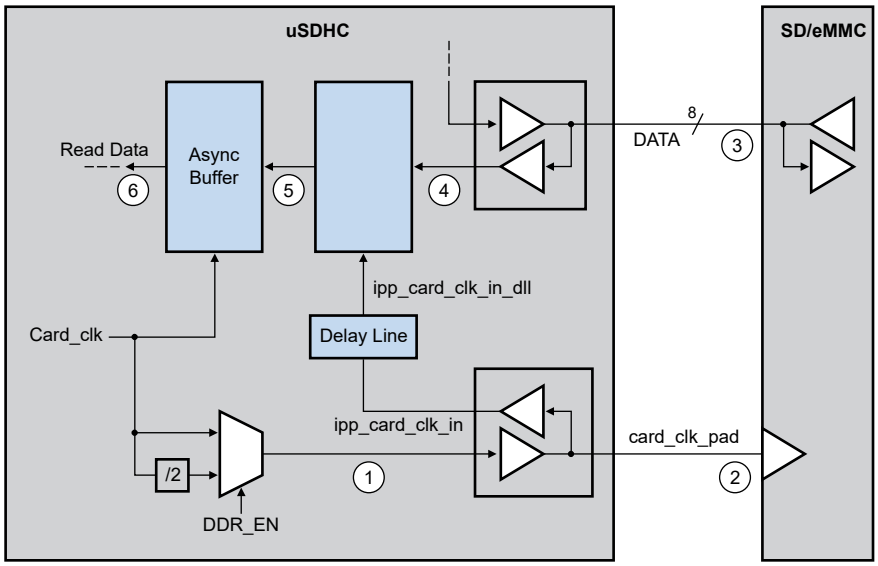

Figure 554. DLL in read path

81.5.3.3 Suspend Resume

The uSDHC module supports the Suspend Resume operations of SDIO, although slightly different than the suggested implementation of Suspend in the SDIO specification.

81.5.3.3.1 Suspend

After setting the SABGREQ bit, the host driver may send a Suspend command to switch to another function of SDIO. The uSDHC module does not monitor the content of the response, so it does not know if the Suspend command succeeded or not. Accordingly, it does not de-assert Read Wait for read pause. To solve this problem, the host driver does not mark the Suspend command as "Suspend", (that is, setting the CMDTYP bits to 01). Instead, the driver sends this command as if it were a normal command, and only when the command succeeds, and the BS bit is set in the response, can the Driver send another command marked as "Suspend" to inform uSDHC that the current transfer is suspended. Here is the sequence for the Suspend operation:

1. Set the SABREQ bit to pause the current data transfer at block gap.
2. After the BGE bit is set, send the Suspend command to suspend the active function. The CMDTYP bit field must be 2'b00.

3. Check the BS bit of the CCCR in the response. If it is 1, repeat this step until the BS bit is cleared or abandon the suspend operation according to the Driver strategy.
4. Send another normal I/O command to the suspended function. The CMDTYP of this command must be 2'b01, so uSDHC can detect this special setting and be informed that the paused operation has successfully suspended. If the paused transfer is a read operation, uSDHC stops driving DATA2 and goes to the idle state.
5. Save the context registers in the system memory for later use, including the DMA System Address Register (for internal DMA operation), and the Block Attribute Register.
6. Begin operation for another function on SDIO.

81.5.3.3.2 Resume

To resume the data transfer, a Resume command is issued:

1. To resume the suspended function, restore the context register with the saved value in step #5 of the Suspend operation.
2. Send the Resume command: In the Transfer Type register, all the bit fields are set to the value as if this were another ordinary data transfer instead of a transfer resume (except the CMDTYP is set to 2'b10).
3. If the Resume command has responded, the data transfer is resumed.

81.5.3.4 ADMA usage

To use the ADMA in a data transfer, the host driver must prepare the correct descriptor chain prior to sending the read/write command. The steps to prepare the correct descriptor chain are these:

1. Create a descriptor to set the data length that the current descriptor group is about to transfer. The data length should be even numbers of the block size.
2. Create another descriptor to transfer the data from the address setting in this descriptor. The data address must be at a page boundary (4KB address aligned).
3. If necessary, create a Link descriptor containing the address of the next descriptor. The descriptor group is created in steps 1 ~ 3.
4. Repeat steps 1 ~ 3 until all descriptors are created.
5. In the last descriptor, set the End flag to 1 and make sure the total length of all descriptors matches the product of the block size and block number configured in the Block Attribute Register.
6. Set the ADMA System Address Register to the address of the first descriptor and set the DMAS field in the Protocol Control Register to 01 to select the ADMA.
7. Issue a write or read command with the DMAEN bit set to 1 in the Transfer Type Register.

Steps 1 ~ 5 are independent of step 6, so step 6 can finish before steps 1 ~ 5. Regarding the descriptor configuration, it is recommended not to use the Link descriptor as it requires extra system memory access.

81.5.3.5 Transfer error

Information about CRC, Internal DMA, Transfer ADMA, and Auto CMD12 errors are detailed in the sections below.

81.5.3.5.1 CRC error

It is possible at the end of a block transfer that a write CRC status error or read CRC error occurs. For this type of error, the latest block received is discarded. This is because the integrity of the data block is not guaranteed. It is recommended to discard the following data blocks and re-transfer the block from the corrupted one. For a multi-block transfer, the host driver issues a CMD12 to abort the current process and start the transfer by a new data command. In this scenario, even when the AC12EN and BCEND bits are set, uSDHC does not automatically send a CMD12 because the last block is not transferred. On the other hand, if it is within the last block that the CRC error occurs, an Auto CMD12 is sent by uSDHC. In this case, the host driver re-sends or re-obtains the last block with a single block transfer.

81.5.3.5.2 Internal DMA error

During the data transfer with internal Simple DMA, if the DMA engine encounters an error on the AHB bus, the DMA operation is aborted, and the DMA error interrupt is sent to the host system. When acknowledged by such an interrupt, the host driver calculates the start address of data block in which the error occurs. The start address can be calculated by either:

- Reading the DMA System Address register: The error occurs during the previous burst. Considering the block size, the previous burst length and the start address of the next burst transfer, it is straight forward to obtain the start address of the corrupted block.
- Reading the BLKCNT field of the Block Attribute register: Considering the number of blocks left, the total number to transfer, the start address of transfer, and the size of each block, the start address of corrupted block can be determined.To use this method, MIX_CTRL[BCEN] bit has to be set to enable Block Attribute register update.

When a DMA error occurs, it is recommended to abort the current transfer by means of a CMD12 (for multi block transfer), apply a reset for data, and restart the transfer from the corrupted block to recover from the error.

81.5.3.5.3 Transfer ADMA error

There are three kinds of possible ADMA errors: The AHB transfer, invalid descriptor, and data-length mismatch. Whenever these errors occur, the DMA transfer stops and the corresponding error status bit is set. For acknowledging the status, the host driver should recover the error as shown below and re-transfer from the place of interruption.

- AHB transfer error: Such errors may occur during data transfer or descriptor fetch. For either scenario, it is recommended to retrieve the transfer context, reset for the data part and re-transfer the block that was corrupted, or to the next block if no block is corrupted.
- Invalid descriptor error: For such errors, it is recommended to retrieve the transfer context, reset for the data part and recreate the descriptor chain from the invalid descriptor and issue a new transfer. As the data to transfer now may be less than the previous setting, the data length configured in the new descriptor chain should match the new value.
- Data-length mismatch error: It is similar to recover from this error. The Host Driver polls relating registers to retrieve the transfer context, apply a reset for the data part, configure a new descriptor chain and make another transfer if there is data left. Like the previous scenario of the invalid descriptor error, the data length must match the new transfer.

81.5.3.5.4 Auto CMD12 error

After the last block of the multi-block transfer is sent or received, and the AC12EN bit is set when the data transfer is initiated by the data command, uSDHC automatically sends a CMD12 to the card to stop the transfer. When errors with this command occur, it is recommended to the host driver to deal with the situations in the following manner:

- Auto CMD12 response time-out: It is not certain whether the command is accepted by the card or not. The host driver clears the auto CMD12 error status bits and re-send CMD12 until it is accepted by the card.
- Auto CMD12 response CRC error: As the card responds to CMD12, it aborts the transfer. The host driver may ignore the error and clear the error status bit.
- Auto CMD12 conflict error or not sent: The command is not sent; therefore, the host driver sends a CMD12 manually.

81.5.3.6 Card interrupt

The external cards can inform the host controller by means of some special signals. For SDIO, it can be the low-level on the DATA1 line during some special period. The uSDHC module only monitors the DATA1 line and supports the SDIO interrupt.

When the SDIO interrupt is captured by uSDHC, and the host system is informed by uSDHC asserting the uSDHC interrupt line, the interrupt service from the host driver is called.

As the interrupt source is controlled by the external card, the interrupt from SDIO must be serviced before the CINT bit is cleared. Refer to Card interrupt handling for the card interrupt handling flow.

81.5.4 Switch function

A switch command is issued by the host driver to enable new features added to the eMMC and SD cards. The eMMC and SD cards can transfer data at bus widths other than 1-bit. Different speed modes are also defined. To enable these features, a switch command is issued by the host driver.

For SDIO, the high-speed mode are enabled by writing the EHS bit in the CCCR register after the SHS bit is confirmed as high. For SD cards, the high-speed mode are queried and enabled by a CMD6 (with the mnemonic symbol as SWITCH_FUNC). For eMMC, the high-speed mode is queried by a CMD8 and enabled by a CMD6 (with the mnemonic symbol as SWITCH).

The SDR4-bit, SDR8-bit, DDR4-bit, and DDR8-bit width of eMMC is also enabled by the SWITCH command, but with a different argument.

These new functions can also be disabled by a software reset. For SDIO, it can be done by setting the RES bit in the CCCR register. For other cards, it can be accomplished by issuing a CMD0. This method of restoring to the normal mode is not recommended because a complete identification process is needed before the card is ready for data transfer.

For the sake of simplicity, the following pseudo-code examples do not show current capability check, which is recommended in the function switch process.

81.5.4.1 Query, enable, and disable SDIO high-speed mode

```
enable_sdio_high_speed_mode(void)
{
send CMD52 to query bit SHS at address 0x13;
if (SHS bit is '0') report SDIO does not support high speed mode and return;
send CMD52 to set bit EHS at address 0x13 and read after write to confirm EHS bit is set;
change clock divisor value or configure the system clock feeding into uSDHC to generate the card_clk
of around 50MHz;
(data transactions like normal peers)
}
disable_sdio_high_speed_mode(void)
{
send CMD52 to clear bit EHS at address 0x13 and read after write to confirm EHS bit is cleared;
change clock divisor value or configure the system clock feeding into uSDHC to generate the card_clk
of the desired value below 25MHz;
(data transactions like normal peers)
}
```

81.5.4.2 Query, enable, and disable SD high-speed mode

```
enable_sd_speed_mode(void)
{
set BLKCNT field to 1 (block), set BLKSIZE field to 64 (bytes);
send CMD6, with argument 0xFFFFFx and read 64 bytes of data accompanying the R1 response;(high speed
mode,x=1;)
wait data transfer done bit is set;
check if the bit x of received 512 bits is set;
if (bit 401 is '0') report the SD card does not support high speed mode and return;

      send CMD6, with argument 0x80FFFFFx and read 64 bytes of data accompanying the R1 response;
(high speed mode,x=1;)
check if the bit field 379~376 is 0xF;
if (the bit field is 0xF) report the function switch failed and return;
change clock divisor value or configure the system clock feeding into uSDHC to generate the card_clk
of around 50MHz for high speed mode
(data transactions like normal peers)
}
```

```
disable_sd_speed_mode(void)
{
set BLKCNT field to 1 (block), set BLKSIZE field to 64 (bytes);
send CMD6, with argument 0x80FFFFF0 and read 64 bytes of data accompanying the R1 response;
check if the bit field 379~376 is 0xF;
if (the bit field is 0xF) report the function switch failed and return;
change clock divisor value or configure the system clock feeding into uSDHC to generate the
card_clk of the desired value below 25MHz;
(data transactions like normal peers)
}
```

81.5.4.3 Query, enable, and disable eMMC high-speed mode

```
enable_mmc_high_speed_mode(void)
{
send CMD9 to get CSD value of eMMC;
check if the value of SPEC_VER field is 4 or above;
if (SPEC_VER value is less than 4) report the eMMC does not support high speed mode and return;
set BLKCNT field to 1 (block), set BLKSIZE field to 512 (bytes);
send CMD8 to get EXT_CSD value of eMMC;
extract the value of CARD_TYPE field to check the 'high speed mode' in this eMMC is 26MHz or
52MHz;
send CMD6 with argument 0x1B90100;
send CMD13 to wait card ready (busy line released);
send CMD8 to get EXT_CSD value of eMMC;
check if HS_TIMING byte (byte number 185) is 1;
if (HS_TIMING is not 1) report eMMC switching to high speed mode failed and return;
change clock divisor value or configure the system clock feeding into uSDHC to generate the
card_clk of around 26MHz or 52MHz according to the CARD_TYPE;
(data transactions like normal peers)
}
disable_mmc_high_speed_mode(void)
{
send CMD6 with argument 0x2B90100;
set BLKCNT field to 1 (block), set BLKSIZE field to 512 (bytes);
send CMD8 to get EXT_CSD value of eMMC;
check if HS_TIMING byte (byte number 185) is 0;
if (HS_TIMING is not 0) report the function switch failed and return;
change clock divisor value or configure the system clock feeding into uSDHC to generate the
card_clk of the desired value below 20MHz;
(data transactions like normal peers)
}
```

81.5.4.4 Set eMMC bus width

```
change_mmc_bus_width(void)
{
send CMD9 to get CSD value of eMMC;
check if the value of SPEC_VER field is 4 or above;
if (SPEC_VER value is less than 4) report the eMMC does not support multiple bit width and return;
send CMD6 with argument 0x3B70x00; (8-bit(dual data rate), x=6; 4-bit(dual data rate), x=5;8-bit,
x=2; 4-bit, x=1; 1-bit, x=0)
send CMD13 to wait card ready (busy line released);
(data transactions like normal peers)
}
```

81.5.5 ADMA operation

Here are the codes for the ADMA1 and ADMA2 operations.

81.5.5.1 ADMA1 operation

```
Set_adma1_descriptor
{
if (to start data transfer) {
// Make sure the address is 4KB align.
Set 'Set' type descriptor;
{
Set Act bits to 01;
Set [31:12] bits data length (byte unit);
}
Set 'Tran' type descriptor;
{
Set Act bits to 10;
Set [31:12] bits address (4KB align);
}
}
else if (to fetch descriptor at non-continuous address) {
Set Act bits to 11;
Set [31:12] bits the next descriptor address (4KB aligned);
}
else { // other types of descriptor
Set Act bits accordingly
}
if (this descriptor is the last one) {
Set End bit to 1;
}
if (to generate interrupt for this descriptor) {
Set Int bit to 1;
}
Set Valid bit to 1;
}
```

81.5.5.2 ADMA2 operation

```
Set_adma2_descriptor
{
if (to start data transfer) {
// Make sure the address is a 32-bit boundary (lower 2-bit are always '00').
Set higher 32-bit of descriptor for this data transfer initial address;
Set [31:16] bits data length (byte unit);
Set Act bits to '10';
}
else if (to fetch descriptor at non-continuous address) {
Set Act bits to '11';
// Make sure the address is 32-bit boundary (lower 2-bit are always set to '00').
Set higher 32-bit of descriptor for the next descriptor address;
}
else { // other types of descriptor
Set Act bits accordingly
}
if (this descriptor is the last one) {
Set 'End' bit '1';
}
if (to generate interrupt for this descriptor) {
```

```
Set 'Int' bit '1';
}
Set the 'Valid' bit to '1';
}
```

81.5.6 Fast boot operation

81.5.6.1 Normal fast boot flow

Here are the steps for normal fast boot flow:

1. Software must configure the SYS_CTRL[INITA] bit to make sure that 74 card clocks are finished.
2. Software must configure the eMMC Boot Register (offset 0xc4) bit 6 to 1 (enable boot), and bit 5 to 0 (normal fast boot), and bit 4 to select the ack mode. If the data is sent through the DMA mode, the software should configure bit 7 to enable the automatic stop at block gap feature, and configure bit 3-bit 0 to select the ack timeout value according to the SD CLK frequency.
3. Software then needs to configure the Block Attributes Register to set the block size and count. If in DDR fast boot mode, the block size only can be configured to 512 bytes.
4. Software must configure the Protocol control register to set Data Transfer Width (DTW). If in the DDR fast boot mode, DTW only can be configured to 4-bit/8-bit dataline mode.
5. Software needs to configure the Command Argument Register to set argument if needed (no need in normal fast boot).
6. Software must configure the Transfer Type Register to start the boot process. In normal boot mode, CMDINX, CMDTYP, RSPTYP, CICEN, CCCEN, AC12EN, BCEN and DMAEN retain the default value, where DPSEL bit is set to 1, DTDSEL is set to 1 and MSBSEL is set to 1.
7. DMAEN should be configured as 0 in the polling mode and if BCEN is configured as 1, it is recommended to configure the number of blocks in the Block Attributes Register to the maximum value. If in DDR fast boot mode, DDR_EN needs to be set to 1.
8. When step 6 is configured, the boot process begins. The software needs to poll the data buffer ready status to read the data from the buffer in time. If a boot timeout happens (ack times out or the first data read times out), an interrupt is triggered, and the software must configure eMMC Boot Register to bit 6 to 0 to disable boot. This makes CMD high, then after at least 56 clocks, it is ready to begin a normal initialization process.
9. If there is no timeout, software needs to determine when the data read is finished and then configure eMMC Boot Register bit 6 to 0 to disable boot. This render CMD line high and command completed asserted. After at least 56 clocks, it is ready to begin the normal initialization process.
10. You must reset the host and begin the normal process.

81.5.6.2 Alternative fast boot flow

Here are the steps for alternative fast boot flow:

1. Software needs to configure SYS_CTRL[INITA] to make sure 74 card clocks are finished.
2. Software needs to configure eMMC Boot Register (offset 0xc4) bit 6 to 1 (enable boot), and bit 5 to 1 (alternative boot), and bit 4 to select the ack mode or not. If data needs to be sent through the DMA mode, then configure bit 7 to enable the automatic stop at block gap feature. Software should also configure bit 3-bit 0 to select the ack timeout value according to the SD clock frequency.
3. Software then needs to configure the Block Attributes Register to set the block size and count. If in the DDR fast boot mode, the block size only can be configured to 512 bytes.
4. Software needs to configure the Protocol control register to set the data transfer width (DTW). If in the DDR fast boot mode, DTW only can be configured to 4-bit/8-bit dataline mode.
5. Software needs to configure Command Argument Register to set argument to 0xFFFFFFFA.

6. Software needs to configure the Transfer Type Register to start the boot process by CMD0 with the 0xFFFFFFFA argument. In alternative boot, CMDINX, CMDTYP, RSPTYP, CICEN, CCCEN, AC12EN, BCEN, and DMAEN retain the default value. DPSEL bit is set to 1, DTDSEL is set to 1, and MSBSEL is set to 1. Note DMAEN should be configured as 0 in the polling mode, and if BCEN is configured as 1 in polling mode, it is recommended to configure the block count in the Block Attributes Register to the maximum value. If in the DDR fast boot mode, DDR_EN needs to be set to 1.
7. When step 6 is configured, the boot process begins. Software needs to poll the data buffer ready status to read the data from the buffer in time. If there is a boot timeout (ack data timeout in 50ms or data timeout in 1s), the host sends out the interrupt and the software needs to send CMD0 with reset and then configure the boot enable bit to 0 to stop this process.
8. If there is no time out, the software needs to decide when to stop the boot process, and send out the CMD0 with reset and then after the command is completed, configure the eMMC Boot Register bit 6 to stop the process. After 8 clocks from the command completion, the slave (card) is ready for the identification step.
9. You must reset the host and begin the normal process.

81.5.6.3 Fast boot application case (in DMA mode)

In the boot application case, because the image destination and the image size are contained in the beginning of the image, it is necessary to switch DMA parameters on the fly during eMMC fast boot.

In fast boot, the host can use Advanced DMA2 (ADMA2) with two destinations.

The detailed flow is described below:

1. The software needs to configure INIT_ACTIVE bit (system control register bit 27) to make sure that 74 card clocks are finished.
2. The software needs to configure the eMMC Boot Register (offset 0xc4) bit 6 to 1 (enable boot); and bit 5 to 0 (normal fast boot) or 1 (alternative boot); and bit 4 to select the ack mode. In DMA mode, configure bit 7 to 1 to enable the automatic stop at block gap feature. Also configure bits[31-16] to set the (BLK_CNT - VALUE1). Here VALUE1 is the value of the block count that needs to transfer the first time, so that the host stops at the block gap when the uSDHC controller gets VAULE1 blocks from the device. Also, configure bits[3-0] to select the ack timeout value according to the SD clock frequency.
3. The software then needs to configure the Block Attributes Register to set block size and count. If in DDR fast boot mode, the block size only can be configured to 512 bytes. In DMA mode, it is recommended to set the block count (BLK_CNT) to the max value (16'hffff).
4. The software needs to configure Protocol Control Register to set DTW (data transfer width). If in DDR fast boot mode, the DTW only can be configured to 4-bit/8-bit dataline mode.
5. Software enable ADMA2 by configuring Protocol Control Register bits [9-8].
6. The software needs to set at least three pairs of ADMA2 descriptor in boot memory (that is, in IRAM, at least six words). The first pair descriptor defines the start address (that is, IRAM) and data length (that is,512byte*VALUE1) of the first part boot code. The software also needs to set the second pair descriptor, the second start address (any value that is writable), and data length is suggested to set 1~2word (record as VALUE2). Note that the second couple desc also transfers useful data even at lease 1 word, because our ADMA2 cannot support 0 data_length data transfer descriptor.
7. The software needs to configure Command Argument Register to set argument to 0xFFFFFFFA in alternative fast boot and do not need to be set in normal fast boot.
8. The software needs to configure Transfer Type Register to start the boot process. CMDINX, CMDTYP, RSPTYP, CICEN, CCCEN, AC12EN, BCEN, and DMAEN retain the default value. DPSEL bit is set to 1, DTDSEL is set to 1, and MSBSEL is set to 1. DMAEN is configured as 1 in the DMA mode. And, if BCEN is configured as 1, then configure blk no in Bock Attributes Register to the max value. And, if in the DDR fast boot mode, DDR_EN needs to be set to 1.
9. When step 8 is configured, boot process begins, the first VALUE1 block number data gets transferred. The software needs to poll the TC bit (bit1 in Interrupt Status Register) to determine first transfer is ended. Also, the software needs to polling the BGE bit (bit2 in Interrupt Status Register) to determine if the first transfer stops at the block gap.

10. When TC and BGE bits are set to 1, the software can analyze the first code of VALUE1 block, initializes the new memory device, if required, and sets the third pair of descriptors to define the start address and length of the remaining part of the boot code (VALUE3, the remain boot code block). Remember to set the last descriptor with END.
11. The software needs to configure the eMMC Boot Register (offset 0xc4) again. Set bit 6 to 1 (enable boot); and bit 5 to 0 (normal fast boot), to 1 (alternative boot); and bit 4 to select the ack mode or not. In the DMA mode, configure bit 7 to 1 for enabling the automatically stop at block gap feature. Also, configure bit31-bit16 to set the (BLK_CNT - (VALUE1+1+VALUE3)), that host stops at block gap when the uSDHC controller gets (VALUE1+1+VALUE3)) blocks from device totally include the blocks received in step 9. And need to configure bit 3-bit0 to select the ack timeout value according to the sd clk frequency. Note that the software does not need to configure the BLK_CNT again, because it is counted down automatically by the uSDHC controller.
12. The software needs to clear the TC and BGE bits and the software needs to clear SABGREQ (bit 16 in the Protocol control register) and set CREQ (bit17 in the Protocol control register) to 1 to resume the data transfer. Host transfers the VALUE2 and VALUE3 data to the destination that is set by descriptor.
13. The software needs to do poll BGE bit to determine if the fast boot is over.

Note:

- When ADMA boot flow starts, for uSDHC, it is like a normal ADMA read operation. So, set ADMA2 descriptor as the normal ADMA2 transfer.
- Need a few words length memory to keep descriptor.
- For the 1~2-word data in second descriptor setting, it is a useful data, so the software needs to deal the data because of the application case.

81.6 uSDHC memory map and register definition

81.6.1 uSDHC register descriptions

This section includes the module memory map and detailed descriptions of all registers.

See the table below for the register memory map of uSDHC. All these registers only support 32-bit accesses.

NOTE

The uSDHC registers are 32-bit wide and only support 32-bit access.

81.6.1.1 uSDHC memory map

usdhc base address: 404E_4000h

Offset	Register	Width (In bits)	Access	Reset value
0h	DMA System Address (DS_ADDR)	32	RW	0000_0000h

81.6.1.2 DMA System Address (DS_ADDR)

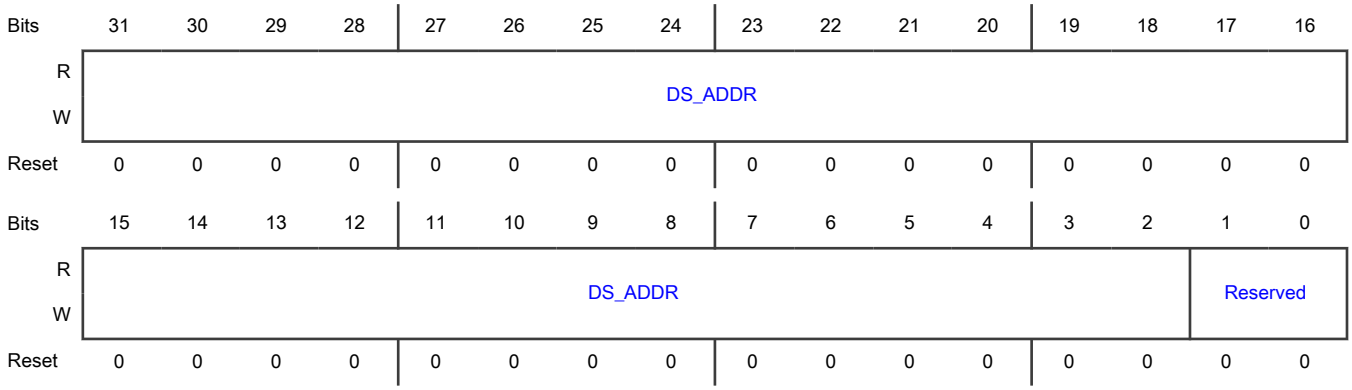
Offset

Register	Offset
DS_ADDR	0h

Function

This register contains the physical system memory address used for DMA transfers.

Diagram



Fields

Field	Function
31-2 DS_ADDR	DMA system address This field contains the memory address for a DMA transfer. Because the address must be word (4 bytes) aligned, the least 2 bits are reserved, always 0. When uSDHC stops a DMA transfer, this field points to the system address of the next contiguous data position. It can be accessed only when no transaction is executing (that is, after a transaction has stopped). Read operation during transfers may return an invalid value. The host driver initializes this field before starting a DMA transaction. After DMA has stopped, the system address of the next contiguous data position can be read from this field. This field is protected during a data transfer. When data lines are active, write to this field is ignored. The host driver waits until the DLA field in the Present State register is cleared, before writing to this field. The uSDHC internal DMA does not support a virtual memory system. It only supports continuous physical memory access. Also, because AHB burst limitations, if the burst must cross the 1 KB boundary, uSDHC automatically changes SEQ burst type to NSEQ. Because this field supports dynamic address reflecting, when TC field is set, it automatically alters the value of internal address counter, so the software cannot change this field when TC field is set. Such restriction is also listed in Software restrictions.
1-0 —	Reserved

81.6.1.3 Block Attributes (BLK_ATT)

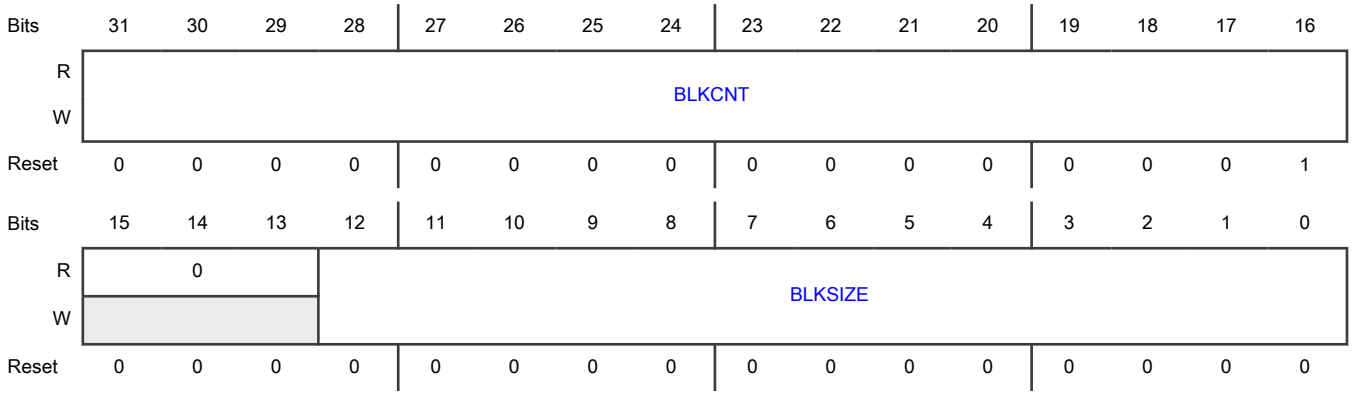
Offset

Register	Offset
BLK_ATT	4h

Function

This register is used to configure the number of data blocks and the number of bytes in each block.

Diagram



Fields

Field	Function
31-16 BLKCNT	Blocks count for current transfer This field is enabled when the Block Count Enable field in the Transfer Mode register is set to 1 and is valid only for multiple block transfers. For single block transfer, this field always reads as 1. The host driver sets this field to a value between 1 and the maximum block count. The uSDHC module decrements the block count after each block transfer and stops when the count reaches zero. Setting the block count to zero results in no data blocks being transferred. This field should be accessed only when no transaction is executing (that is, after transactions are stopped). During data transfer, read operations on this field may return an invalid value and write operations are ignored. When saving transfer content because of a Suspend command, the number of blocks yet to be transferred can be determined by reading this field. The reading of this field should be applied after transfer is paused by stop at block gap operation and before sending the command marked as suspend. This is because when the Suspend command is sent out, uSDHC treats the current transfer as aborted and change the BLKCNT field back to its original value instead of keeping the dynamical indicator of the remaining block count. When restoring transfer content prior to issuing a Resume command, the host driver restores the previously saved block count. **NOTE** Although the BLKCNT field is 0 after reset, the read of reset value is 0x1. This is because when MSBSEL field is indicating a single block transfer, the read value of BLKCNT is always 1. 0000_0000_0000_0000b - Stop count 0000_0000_0000_0001b - 1 block 0000_0000_0000_0010b - 2 blocks 1111_1111_1111_1111b - 65535 blocks
15-13 —	Reserved
12-0	Transfer block size

Table continues on the next page...

Table continued from the previous page...

Field	Function
BLKSIZE	This field specifies the block size for block data transfers. Values ranging from 1 byte up to the maximum buffer size can be set. It can be accessed only when no transaction is executing (that is, after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations are ignored. 0_0000_0000_0000b - No data transfer 0_0000_0000_0001b - 1 byte 0_0000_0000_0010b - 2 bytes 0_0000_0000_0011b - 3 bytes 0_0000_0000_0100b - 4 bytes 0_0001_1111_1111b - 511 bytes 0_0010_0000_0000b - 512 bytes 0_1000_0000_0000b - 2048 bytes 1_0000_0000_0000b - 4096 bytes

81.6.1.4 Command Argument (CMD_ARG)

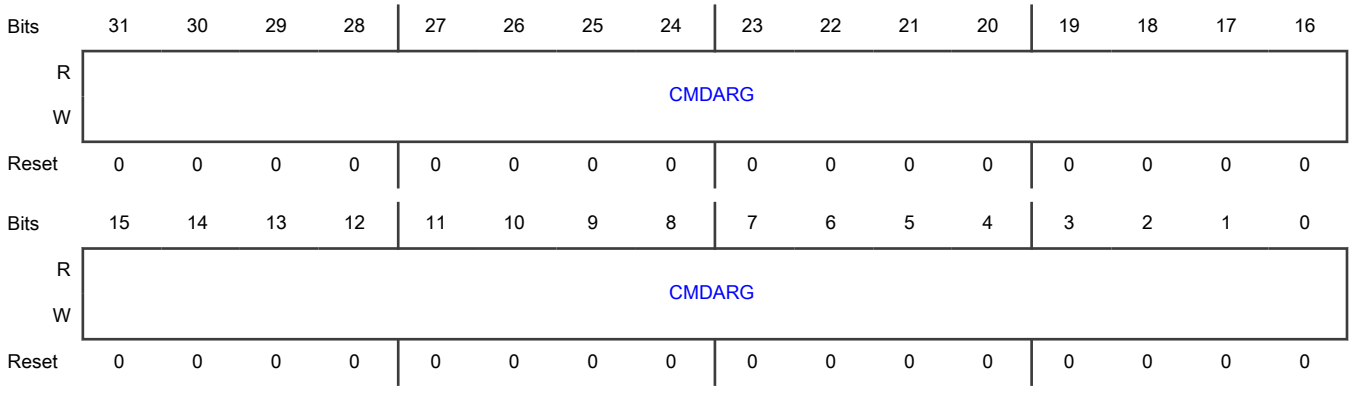
Offset

Register	Offset
CMD_ARG	8h

Function

This register contains the SD/eMMC command argument.

Diagram



Fields

Field	Function
31-0 CMDARG	Command argument The SD/eMMC command argument is specified as bits 39-8 of the command format in the SD or eMMC specification. This field is write protected when the Command Inhibit (CMD) field in the Present State register is set.

81.6.1.5 Command Transfer Type (CMD_XFR_TYP)

Offset

Register	Offset
CMD_XFR_TYP	Ch

Function

This register is used to control the operation of data transfers. The host driver sets this register before issuing a command followed by a data transfer or before issuing a Resume command. To prevent data loss, uSDHC prevents writing to the bits, which are involved in the data transfer of this register, when data transfer is active. These fields are DPSEL, MBSEL, DTDSEL, AC12EN, BCEN, and DMAEN.

The host driver checks the Command Inhibit DAT field (PRES_STATE[CDIHB]) and the Command Inhibit CMD field (PRES_STATE[CIHB]) in the Present State register before writing to this register. When the CDIHB field in the Present State register is set, any attempt to send a command with data by writing to this register is ignored; when the CIHB field is set, any write to this register is ignored.

On sending commands with data transfer involved, it is mandatory that the block size is non-zero. Block count must also be non-zero, or indicated as a single block transfer (bit 5 of this register is '0' when written), or block count is disabled (bit 1 of this register is '0' when written), otherwise uSDHC ignores the sending of this command and do nothing. For write command, with all above restrictions, it is also mandatory that the write protect switch is not active (PRES_STATE[WPSPL] field of Present State register is '1'); otherwise, uSDHC also ignores the command.

If the commands with data transfer do not receive the response in 64 clock cycles, that is, if response time-out happens, uSDHC treats the external device, does not accept the command, and aborts the data transfer. In this scenario, the driver should issue the command again to retry the transfer. It is also possible that for some reason the card responds to the command but uSDHC does not receive the response, and if it is internal DMA (either simple DMA or ADMA) read operation, the external system memory is over-written by the internal DMA with data sent back from the card.

The table below shows the summary of how register settings determine the type of data transfer.

Table 812. Transfer type register setting for various transfer types

Multi/single block select	Block count enable	Block count	Function
0	Do not care	Do not care	Single transfer
1	0	Do not care	Infinite transfer
1	1	Positive number	Multiple transfer
1	1	Zero	No data transfer

The table below shows the relationship between the Command Index Check Enable and the Command CRC Check Enable, regarding the Response Type bits as well as the name of the response type.

Table 813. Relationship between parameters and the name of the response type

Response type	Index check enable	CRC check enable	Name of response type
00	0	0	No response
01	0	1	R2
10	0	0	R3, R4
10	1	1	R1, R5, R6
11	1	1	R1b,R5b

- In the SDIO specification, response type notation for R5b is not defined. R5 includes R5b in the SDIO specification, but R5b is defined in this specification to specify that uSDHC checks the busy status after receiving a response. For example, usually CMD52 is used with R5, but the I/O abort command is used with R5b.
- The CRC fields for R3 and R4 are expected to be all 1 bits. The CRC check is disabled for these response types.

Fields

Field	Function
31-30 —	Reserved
29-24 CMDINX	Command index These fields are set to the command number that is specified in bits 45-40 of the command-format in the SD Memory Card Physical Layer Specification and SDIO Specification.
23-22 CMDTYP	Command type There are three types of special commands: Suspend, Resume, and Abort. These fields are set to 00b for all other commands.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• Suspend command: If the Suspend command succeeds, uSDHC assumes that the card bus has been released and that it is possible to issue the next command that uses the DATA line. Because uSDHC does not monitor the content of command response, it does not know if the Suspend command succeeded or not. It is the host driver's responsibility to check the status of the Suspend command and send another command marked as Suspend to inform uSDHC that a Suspend command was successfully issued. See Suspend Resume for more details. After the end bit of command is sent, uSDHC deasserts Read Wait for read transactions and stops checking busy for write transactions. In a 4-bit mode, the interrupt cycle starts. If the Suspend command fails, uSDHC maintains its current state, and the host driver restarts the transfer by setting the Continue Request field in the Protocol Control register. • Resume command: The host driver re-starts the data transfer by restoring the registers saved before sending the Suspend command and then sends the Resume command. The uSDHC module checks for a pending busy state before starting write transfers. • Abort command: If this command is set when executing a read transfer, uSDHC stops reads to the buffer. If this command is set when executing a write transfer, uSDHC stops driving the DATA line. After issuing the Abort command, the host driver should issue a software reset (Abort Transaction). 00b - Normal other commands 01b - Suspend CMD52 for writing bus suspend in CCCR 10b - Resume CMD52 for writing function select in CCCR 11b - Abort CMD12, CMD52 for writing I/O Abort in CCCR
21 DPSEL	Data present select This field is set to 1 to indicate that data is present and is transferred using the DATA line. It is set to 0 for the following: • Commands using only the CMD line (for example, CMD52) • Commands with no data transfer, but using the busy signal on DATA0 line (R1b or R5b (for example, CMD38)) **NOTE** In resume command, this field is set, and other bits in this register is set the same as when the transfer was initially launched. When the write protect switch is on, (that is, the WPSPL field is active as '0'), any command with a write operation ignored. When this field is set, while the DTDSEL field is 0, writes to the register Transfer Type are ignored. 0b - No data present 1b - Data present
20 CICEN	Command index check enable If this field is set to 1, uSDHC checks the Index field in the response to see if it has the same value as the command index. If it is not, it is reported as a Command Index Error. If this field is set to 0, the Index field is not checked. 0b - Disable command index check 1b - Enables command index check

Table continues on the next page...

Table continued from the previous page...

Field	Function
19 CCCEN	Command CRC check enable If this field is set to 1, uSDHC checks the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this field is set to 0, the CRC field is not checked. The number of bits checked by the CRC field value changes according to the length of the response. See RSPTYP[1:0] and Command Transfer Type (CMD_XFR_TYP). 0b - Disables command CRC check 1b - Enables command CRC check
18 —	Reserved
17-16 RSPTYP	Response type select 00b - No response 01b - Response length 136 10b - Response length 48 11b - Response length 48, check busy after response
15-8 —	Reserved
7 AC23EN	AC23EN This field is read when VEND_SPEC[CMD_BYTE_EN] is enabled; otherwise, this field is tied to '0'. When this field is set to 1, the host controller issues a CMD23 automatically before issuing a command specified in the Command Register. 0b - Disable 1b - Enable
6 NIBBLE_POS	NIBBLE_POS This field indicates the nibble position in the DDR 4-bit mode. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is enabled; otherwise, this field is read-only. 0- the sequence is 'odd high nibble -> even high nibble -> odd low nibble -> even low nibble'; 1- the sequence is 'odd high nibble -> odd low nibble -> even high nibble -> even low nibble'. 0b - Disable 1b - Enable
5 MSBSEL	MSBSEL This field enables multiple block DATA line data transfers. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is enabled; otherwise, this field is read-only. For any other commands, this field can be set to 0. If this field is 0, it is not necessary to set the Block Count register. See Command Transfer Type (CMD_XFR_TYP). 0b - Disable

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1b - Enable
4 DTDSEL	DTDSEL This field defines the direction of DATA line data transfers. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is enabled; otherwise, this field is read-only. The field is set to 1 by the host driver to transfer data from the SD card to uSDHC and is set to 0 for all other commands. 0b - Disable 1b - Enable
3 DDR_EN	DDR_EN Dual data rate mode selection. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is enabled; otherwise, this field is read-only. 0b - Disable 1b - Enable
2 AC12EN	AC12EN Multiple block transfers for memory require a CMD12 to stop the transaction. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is enabled; otherwise, this field is read-only. When this field is set to 1, uSDHC issues a CMD12 automatically when the last block transfer has completed. The host driver is not set this field to issue commands that do not require CMD12 to stop a multiple block data transfer. In particular, secure commands defined in File Security Specification (see reference list) do not require CMD12. In single block transfer, uSDHC ignores this field no matter it is set or not. 0b - Disable 1b - Enable
1 BCEN	BCEN This field is used to enable the Block Count register, which is only relevant for multiple block transfers. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is enabled; otherwise, this field is read-only. When this field is 0, the internal counter for block is disabled, which is useful in executing an infinite transfer. 0b - Disable 1b - Enable
0 DMAEN	DMAEN This field enables DMA functionality. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is enabled; otherwise, this field is read-only. If this field is set to 1, a DMA operation begins when the host driver sets the DPSEL field of this register. Whether the simple DMA or the advanced DMA is active depends on the DMA Select field of the Protocol Control register. 0b - Disable 1b - Enable

81.6.1.6 Command Response0 (CMD_RSP0)

Offset

Register	Offset
CMD_RSP0	10h

Function

Fields

Field	Function
31-0 CMDRSP2	Command response 2 See Command Response3 (CMD_RSP3) for the mapping of command responses from the SD bus to this field for each response type.

81.6.1.9 Command Response3 (CMD_RSP3)

Offset

Register	Offset
CMD_RSP3	1Ch

Function

This register is used to store part 3 of the response bits from the card.

The table below describes the mapping of command responses from the SD bus to Command Response registers for each response type. In this table, R[ ] refers to a bit range within the response data as transmitted on the SD bus.

Table 814. Response bit definition for each response type

Response type	Meaning of response	Response field	Response register
R1,R1b (normal response)	Card status	R[39:8]	CMDRSP0
R1b (auto CMD12 response)	Card status for auto CMD12	R[39:8]	CMDRSP3
R2 (CID, CSD register)	CID/CSD register [127:8]	R[127:8]	{CMDRSP3[23:0], CMDRSP2, CMDRSP1, CMDRSP0}
R3 (OCR register)	OCR register for memory	R[39:8]	CMDRSP0
R4 (OCR register)	OCR register for I/O etc.	R[39:8]	CMDRSP0
R5, R5b	SDIO response	R[39:8]	CMDRSP0
R6 (publish RCA)	New published RCA[31:16] and card status[15:0]	R[39:9]	CMDRSP0

This table shows that most responses with a length of 48 (R[47:0]) have 32-bits of the response data (R[39:8]) stored in the CMDRSP0 register. Responses of type R1b (Auto CMD12 responses) have response data bits (R[39:8]) stored in the CMDRSP3 register. Responses with length 136 (R[135:0]) have 120-bits of the response data (R[127:8]) stored in the CMDRSP0, 1, 2, and 3 registers.

To be able to read the response status efficiently, uSDHC only stores part of the response data in the Command Response registers. This enables the host driver to efficiently read 32-bits of response data in one read cycle on a 32-bit bus system. Parts of the response, the Index field and the CRC, are checked by uSDHC (as specified by the Command Index Check Enable and the

Command CRC Check Enable bits in the Transfer Type register) and generate an error interrupt if any error is detected. The bit range for the CRC check depends on the response length. If the response length is 48, uSDHC checks R[47:1], and if the response length is 136 the uSDHC checks R[119:1].

Because uSDHC may have a multiple block data transfer executing concurrently with a CMD_wo_DAT command, uSDHC stores the Auto CMD12 response in the CMDRSP3 register. The CMD_wo_DAT response is stored in CMDRSP0. This allows uSDHC to avoid overwriting the Auto CMD12 response with the CMD_wo_DAT and vice versa. When uSDHC modifies part of the Command Response registers, as shown in the table above, it preserves the unmodified bits.

81.6.1.10 Data Buffer Access Port (DATA_BUFF_ACC_PORT)

Offset

Register	Offset
DATA_BUFF_ACC_PORT	20h

Function

The Buffer Data Port register is for 32-bit data access by the Arm platform or the external DMA. When the internal DMA is enabled, any write to this field is ignored, and any read from this field always yields 0s.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31-0 DATCONT	Data content This field is used to access the internal buffer.

81.6.1.11 Present State (PRES_STATE)

Offset

Register	Offset
PRES_STATE	24h

Function

The host driver can get status of uSDHC from this 32-bit read only register.

The host driver can issue CMD0, CMD12, CMD13 (for memory) and CMD52 (for SDIO) when the DATA lines are busy during a data transfer. These commands can be issued when Command Inhibit (CMD) is set to zero. Other commands are issued when Command Inhibit (DATA) is set to zero. Possible changes to the SD Physical Specification may add other commands to this list in the future.

NOTE

The reset value of Present State register depends on board connectivity.

Fields

Field	Function
31-24 DLSL	DATA[7:0] line signal level This field is used to check the DATA line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DATA0. The reset value is affected by the external pull-up / pull-down resistors. By default, the read value of this field after reset is 8'b11110111, when DATA3 is pulled down and the other lines are pulled up. 0000_0000b - Data 0 line signal level 0000_0001b - Data 1 line signal level 0000_0010b - Data 2 line signal level 0000_0011b - Data 3 line signal level 0000_0100b - Data 4 line signal level 0000_0101b - Data 5 line signal level 0000_0110b - Data 6 line signal level 0000_0111b - Data 7 line signal level
23 CLSL	CMD line signal level This field is used to check the CMD line level to recover from errors, and for debugging. The reset value is affected by the external pull-up / pull-down resistor, by default, the read value of this field after reset is 1'b1, when the command line is pulled up.
22-20 —	Reserved
19 WPSPL	Write protect switch pin level The Write Protect switch is supported for memory and combo cards. This field reflects the inverted value of the WP pin of the card socket. A software reset does not affect this field. The reset value is affected by the external write protect switch. If the WP pin is not used, it should be tied low, so that the reset value of this field is high and write is enabled.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Write protected (WP = 1) 1b - Write enabled (WP = 0)
18 —	Reserved
17 —	Reserved
16 CINST	Card inserted This field indicates whether a card has been inserted. The uSDHC module debounces this signal so that the host driver does not need to wait for it to stabilize. Changing from a 0 to 1 generates a Card Insertion interrupt in the Interrupt Status register. Changing from a 1 to 0 generates a Card Removal interrupt in the Interrupt Status register. A write to the Force Event Register does not affect this field. The Software Reset For All in the System Control register does not affect this field. A software reset does not affect this field. 0b - Power on reset or no card 1b - Card inserted
15-13 —	Reserved
12 —	Reserved
11 BREN	Buffer read enable This status field is used for non-DMA read transfers. The uSDHC module implements an internal buffer to transfer data efficiently. This read only flag indicates that valid data exists in the host side buffer. If this field is high, valid data greater than the watermark level exist in the buffer. A change of this field from 1 to 0 occurs when some reads from the buffer (read DATPORT (Base + 0x20)) are made and the buffer hasn't valid data greater than the watermark level. A change of this field from 0 to1 occurs when there is enough valid data ready in the buffer and the Buffer Read Ready interrupt has been generated and enabled. 0b - Read disable 1b - Read enable
10 BWEN	Buffer write enable This status field is used for non-DMA write transfers. The uSDHC module implements an internal buffer to transfer data efficiently. This read only flag indicates if space is available for write data. If this field is 1, valid data greater than the watermark level can be written to the buffer. A change of this field from 1 to 0 occurs when some writes to the buffer (write DATPORT (Base + 0x20)) are made and the buffer hasn't valid space greater than the watermark level. A change of this field from 0 to 1 occurs when the buffer can hold valid data greater than the write watermark level and the Buffer Write Ready interrupt is generated and enabled.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Write disable 1b - Write enable
9 RTA	Read transfer active This status field is used for detecting completion of a read transfer. This field is set for either of the following conditions: • After the end field of the read command • When writing a 1 to the Continue Request field in the Protocol Control register to restart a read transfer A transfer complete interrupt is generated when this field changes to 0. This field is cleared for either of the following conditions: • When the last data block as specified by block length is transferred to the System, that is, all data are read away from uSDHC internal buffer. • When all valid data blocks have been transferred from uSDHC internal buffer to the System and no current block transfers are being sent because of the Stop At Block Gap Request being set to 1. 0b - No valid data 1b - Transferring data
8 WTA	Write transfer active This status field indicates a write transfer is active. If this field is 0, it means no valid write data exists in uSDHC. This field is set in either of the following cases: • After the end field of the write command • When writing 1 to the Continue Request field in the Protocol Control register to restart a write transfer This field is cleared in either of the following cases: • After getting the CRC status of the last data block as specified by the transfer count (Single and Multiple) • After getting the CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request During a write transaction, a Block Gap Event interrupt is generated when this field is changed to 0, as result of the Stop At Block Gap Request being set. This status is useful for the host driver in determining when to issue commands during Write Busy state. 0b - No valid data 1b - Transferring data
7-4 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
3 SDSTB	SD clock stable This status field indicates that the internal card clock is stable. This field is for the host driver to poll clock status when changing the clock frequency. It is recommended to clear FRC_SDCLK_ON field in System Control register to remove glitches on the card clock when the frequency is changing. Before changing clock divisor value (SDCLKFS or DVS), host driver should make sure the SDSTB field is high. 0b - Clock is changing frequency and not stable. 1b - Clock is stable.
2 DLA	Data line active This status field indicates whether one of the DATA lines on the SD bus is in use. In the case of read transactions: This status indicates if a read transfer is executing on the SD bus. Changes in this value from 1 to 0, between data blocks, generates a Block Gap Event interrupt in the Interrupt Status register. This field is set in either of the following cases: • After the end field of the read command • When writing a 1 to the Continue Request field in the Protocol Control register to restart a read transfer This field is cleared in either of the following cases: • When the end field of the last data block is sent from the SD bus to uSDHC. • When the Read Wait state is stopped by a Suspend command and the DATA2 line is released. The uSDHC module waits at the next block gap by driving Read Wait at the start of the interrupt cycle. If the Read Wait signal is already driven (data buffer cannot receive data), uSDHC can wait for a current block gap by continuing to drive the Read Wait signal. It is necessary to support Read Wait to use the suspend / resume function. This field remains 1 during Read Wait. In the case of write transactions: This status indicates that a write transfer is executing on the SD bus. Changes in this value from 1 to 0 generate a Transfer Complete interrupt in the Interrupt Status register. This field is set in either of the following cases: • After the end field of the write command • When writing to 1 to the Continue Request field in the Protocol Control register to continue a write transfer This field is cleared in either of the following cases: • When the SD card releases Write Busy of the last data block, uSDHC also detects if the output is not busy. If the SD card does not drive the busy signal after the CRC status is received, uSDHC assumes the card drive "Not Busy". • When the SD card releases write busy, prior to waiting for write transfer, and because of a Stop At Block Gap Request.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	In the case of command with busy pending: This status indicates that a busy state follows the command and the data line is in use. This field is cleared when the DATA0 line is released. 0b - DATA line inactive 1b - DATA line active
1 CDIHB	Command Inhibit Data (DATA) This status field is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this field is 0, it indicates that uSDHC can issue the next SD / eMMC Command. Commands with a busy signal belong to Command Inhibit (DATA) (for example. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Interrupt Status register. **NOTE** The SD host driver can save registers for a suspend transaction after this field has changed from 1 to 0. 0b - Can issue command that uses the DATA line 1b - Cannot issue command that uses the DATA line
0 CIHB	Command inhibit (CMD) If this status bit is 0, it indicates that the CMD line is not in use and uSDHC can issue a SD / eMMC command using the CMD line. This field is set also immediately after the Transfer Type register is written. This field is cleared when the command response is received. Even if the Command Inhibit (DATA) is set to 1, commands using only the CMD line can be issued if this field is 0. Changing from 1 to 0 generates a Command Complete interrupt in the Interrupt Status register. If uSDHC cannot issue the command because of a command conflict error (see Command CRC Error) or because of a Command Not Issued By Auto CMD12 Error, this field remains 1 and the Command Complete is not set. The Status of issuing an auto CMD12 does not show on this field. 0b - Can issue command using only CMD line 1b - Cannot issue command

81.6.1.12 Protocol Control (PROT_CTRL)

Offset

Register	Offset
PROT_CTRL	28h

Function

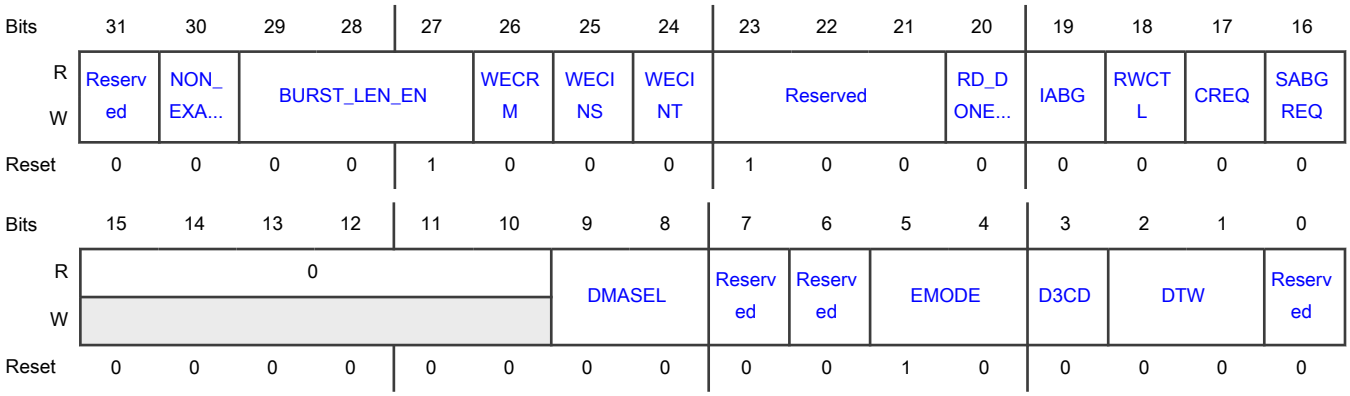
This register controls three cases to restart the transfer after stop at the block gap. Which case is appropriate depends on whether uSDHC issues a Suspend command or the SD card accepts the Suspend command.

- If the host driver does not issue a Suspend command, the Continue request is used to restart the transfer.

- If the host driver issues a Suspend command and the SD card accepts it, a Resume command is used to restart the transfer.
- If the host driver issues a Suspend command and the SD card does not accept it, the Continue request is used to restart the transfer.

Any time stop at block gap request stops the data transfer, the host driver waits for a Transfer Complete (in the Interrupt Status register), before attempting to restart the transfer. When restarting the data transfer by Continue Request, the host driver clears the Stop At Block Gap Request before or simultaneously.

Diagram



Fields

Field	Function
31 —	Reserved Always write as 0
30 NON_EXACT_BLK_RD	Non-exact block read Current block read is non-exact block read. It is only used for SDIO. 0b - The block read is exact block read. Host driver does not need to issue abort command to terminate this multi-block read. 1b - The block read is non-exact block read. Host driver needs to issue abort command to terminate this multi-block read.
29-27 BURST_LEN_EN	BURST length enable for INCR, INCR4 / INCR8 / INCR16, INCR4-WRAP / INCR8-WRAP / INCR16-WRAP This field is used to enable or disable the burst length for the external AHB2AXI bridge. It is useful especially for INCR transfer because without burst length indicator, the AHB2AXI bridge does not know the burst length in advance. Without burst length indicator, AHB INCR transfers can only be converted to SINGLEs on the AXI side. 1xxb - Burst length is enabled for INCR4-WRAP / INCR8-WRAP / INCR16-WRAP. x1xb - Burst length is enabled for INCR4 / INCR8 / INCR16. xx1b - Burst length is enabled for INCR.
26 WECRM	Wakeup event enable on SD card removal

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field enables a wakeup event, via a card removal, in the Interrupt Status register. FN_WUS (Wakeup Support) in CIS does not affect this field. When this field is set, the Card Removal Status and uSDHC interrupt can be asserted without CLK toggling. When the wakeup feature is not enabled, the CLK must be active to assert the Card Removal Status and uSDHC interrupt. 0b - Disables wakeup event enable on SD card removal 1b - Enables wakeup event enable on SD card removal
25 WECINS	Wakeup event enable on SD card insertion This field enables a wakeup event, via a card insertion, in the Interrupt Status register. FN_WUS (Wakeup Support) in CIS does not affect this field. When this field is set, the Card Insertion Status and uSDHC interrupt can be asserted without CLK toggling. When the wakeup feature is not enabled, the CLK must be active to assert the Card Insertion Status and uSDHC interrupt. 0b - Disable wakeup event enable on SD card insertion 1b - Enable wakeup event enable on SD card insertion
24 WECINT	Wakeup event enable on card interrupt This field enables a wakeup event, via a card interrupt, in the Interrupt Status register. This field can be set to 1 if FN_WUS (Wakeup Support) in CIS is set to 1. When this field is set, the Card Interrupt Status and uSDHC interrupt can be asserted without CLK toggling. When the wakeup feature is not enabled, the CLK must be active to assert the Card Interrupt Status and uSDHC interrupt. 0b - Disables wakeup event enable on card interrupt 1b - Enables wakeup event enable on card interrupt
23-21 —	Reserved Always write as 3'b100
20 RD_DONE_NO_8CLK	Read performed number 8 clock According to the SD/eMMC spec, for read data transaction, 8 clocks are needed after the end field of the last data block. So, by default(RD_DONE_NO_8CLK=0), eight clocks are active after the end field of the last read data transaction. However, these 8 clocks should not be active if user wants to use stop at block gap (include the auto stop at block gap in boot mode) feature for read and the RWCTL field (bit18) is not enabled. In this case, software should set RD_DONE_NO_8CLK to avoid these 8 clocks. Otherwise, the device might send extra data to uSDHC while uSDHC ignores these data. In a summary, this field should be set only if the use case needs to use stop at block gap feature while the device can't support the read wait feature.
19 IABG	Interrupt at block gap This field is valid only in 4-bit mode, of SDIO, and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If SDIO cannot signal an interrupt during a multiple block transfer, this field should be set to 0 to avoid an inadvertent interrupt. When the host driver detects an SDIO insertion, it sets this field according to the CCCR of the card.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - Disables interrupt at block gap 1b - Enables interrupt at block gap
18 RWCTL	Read wait control The read wait function provided by this field is optional for SDIO. If the card supports read wait, set this field to enable use of the read wait protocol to stop read data using the DATA2 line. Otherwise, uSDHC has to stop the SD clock to hold read data, which restricts commands generation. When the host driver detects an SDIO insertion, it sets this field according to the CCCR of the card. If the card does not support read wait, this field should never be set to 1; otherwise, DATA line conflicts might occur. If this field is set to 0, stop at block gap during read operation is also supported, but uSDHC stops the SD clock to pause reading operation. 0b - Disables read wait control and stop SD clock at block gap when SABGREQ field is set 1b - Enables read wait control and assert read wait without stopping SD clock at block gap when SABGREQ field is set
17 CREQ	Continue request This field is used to restart a transaction which was stopped using the stop at block gap request. When a suspend operation is not accepted by the card, it is also by setting this field to restart the paused transfer. To cancel stop at the block gap, set stop at block gap request to 0 and set this field to 1 to restart the transfer. The uSDHC module automatically clears this field, therefore it is not necessary for the host driver to set this field to 0. If both stop at block gap request and this field are 1, the continue request is ignored. 0b - No effect 1b - Restart
16 SABGREQ	Stop at block gap request This field is used to stop executing a transaction at the next block gap for both DMA and non-DMA transfers. Until the transfer complete is set to 1, indicating a transfer completion, the host driver leaves this field set to 1. Clearing both the stop at block gap request and continue request does not cause the transaction to restart. Read Wait is used to stop the read transaction at the block gap. The uSDHC module supports the stop at block gap request for write transfers, but for read transfers it requires that SDIO support read wait. Therefore, the host driver does not set this field during read transfers unless SDIO supports Read Wait and has set the read wait control to 1; otherwise, uSDHC stops the SD bus clock to pause the read operation during block gap. In the case of write transfers in which the host driver writes data to the Data Port register, the host driver sets this field after all block data is written. If this field is set to 1, the host driver does not write data to the Data Port register after a block is sent. Once this field is set, the host driver does not clear this field before the Transfer Complete field in Interrupt Status register is set, otherwise uSDHC's behavior is undefined. This field effects read transfer active, write transfer active, DATA Line Active and Command Inhibit (DATA) in the Present State register. 0b - Transfer 1b - Stop
15-10 —	Reserved

Table continues on the next page...

Table continued from the previous page...

Field	Function
9-8 DMASEL	DMA select This field is valid while DMA (SDMA or ADMA) is enabled and selects the DMA operation. 00b - No DMA or simple DMA is selected. 01b - ADMA1 is selected. 10b - ADMA2 is selected. 11b - Reserved
7 —	Reserved
6 —	Reserved
5-4 EMODE	Endian mode This field supports all three endian modes in data transfer. See Data buffer for more details. 00b - Big endian mode 01b - Half word big endian mode 10b - Little endian mode 11b - Reserved
3 D3CD	DATA3 as card detection pin If this field is set, DATA3 should be pulled down to act as a card detection pin. Be cautious when using this feature, because DATA3 is also a chip-select for the SPI mode. A pull-down on this pin and CMD0 might set the card into the SPI mode, which uSDHC does not support. 0b - DATA3 does not monitor card insertion 1b - DATA3 as card detection pin
2-1 DTW	Data transfer width This field selects the data width of the SD bus for a data transfer. The host driver sets it to match the data width of the card. Possible data transfer width is 1-bit, 4-bits or 8-bits. 00b - 1-bit mode 01b - 4-bit mode 10b - 8-bit mode 11b - Reserved
0 —	Reserved

81.6.1.13 System Control (SYS_CTRL)

Offset

Register	Offset
SYS_CTRL	2Ch

Function

This register provides control of the system. See detail in the field description.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																
Reset	1	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1

Fields

Field	Function
31-28 —	Reserved
27 INITA	Initialization active When this field is set, 80 SD-clocks are sent to the card. After the 80 clocks are sent, this field is self cleared. This field is very useful during the card power-up period when 74 SD-clocks are needed and the clock auto gating feature is enabled. Writing 1 to this bit when this field is already 1 has no effect. Writing 0 to this field at any time has no effect. When either of the CIHB and CDIHB fields in the Present State register are set, writing 1 to this field is ignored (that is, when command line or data lines are active, write to this field is not allowed). On the other-hand, when this field is set, that is, during initialization active period, it is allowed to issue command, and the command bit stream appears on the CMD pad after all 80 clock cycles are done. So, when this command ends, the driver can make sure the 80 clock cycles are sent out. This is very useful when the driver needs to send 80 cycles to the card and does not want to wait till this field is self cleared.
26 RSTD	Software reset for data line Only part of the data circuit is reset. DMA circuit is also reset. After this field is set, the software waits for self-clear. The following registers and bits are cleared by this field:

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• Data Port register — Buffer is cleared and initialized • Present State register — Buffer read enable — Buffer write enable — Read transfer active — Write transfer active — DATA line active — Command Inhibit (DATA) • Protocol Control register — Continue request • Interrupt Status register — Buffer read ready — Buffer write ready — DMA interrupt — Block gap event — Transfer complete **NOTE** When reset, the software must make sure there is no incomplete data transferring. If there is data transfer going on, the software needs to wait TC or DC INT_STATUS register is set. 0b - No reset 1b - Reset
25 RSTC	Software reset for CMD line Only part of the command circuit is reset. After this field is set, the software waits for self-clear. The following registers and bits are cleared by this field: • Present State Register — Command Inhibit (CMD) • Interrupt Status Register — Command Complete 0b - No reset 1b - Reset
24 RSTA	Software reset for all

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This reset affects the entire host controller except for the card detection circuit. RSTA resets all the registers that can be reset by RSTC/RSTD. During its initialization, the host driver is set this field to 1 to reset uSDHC. The uSDHC module resets this field to 0 when the capabilities registers are valid and the host driver can read them. Additional use of Software Reset For All does not affect the value of the capabilities registers. After this field is set, it is recommended that the host driver reset the external card and re-initialize it. After this field is set, the software should wait for self-clear. **NOTE** When reset, the software must make sure there is no incomplete data transferring. If there is data transfer going on, the software needs to wait TC or DC INT_STATUS register is set. 0b - No reset 1b - Reset
23 IPP_RST_N	Hardware reset This field's value is output to card through pad directly to hardware reset pin of the card if the card supports this feature.
22 RST_FIFO	Reset the async FIFO Reset the async FIFO between card interface and the internal logic. After this field is set, the software waits for self-clear.
21 —	Reserved
20 —	Reserved
19-16 DTOCV	Data timeout counter value This value determines the interval by which DAT line timeouts are detected. See the Data Timeout Error field in the Interrupt Status register for information on factors that dictate time-out generation. Time-out clock frequency is generated by dividing the base clock SDCLK value by this value. The host driver can clear the Data Timeout Error Status Enable (in the Interrupt Status Enable register) to prevent inadvertent time-out events. 0000b - SDCLK x 2^{14} 0001b - SDCLK x 2^{15} 0010b - SDCLK x 2^{16} 0011b - SDCLK x 2^{17} 0100b - SDCLK x 2^{18} 0101b - SDCLK x 2^{19} 0110b - SDCLK x 2^{20} 0111b - SDCLK x 2^{21}

Table continues on the next page...

Table continued from the previous page...

Field	Function
	1000b - SDCLK x 2^{22} 1001b - SDCLK x 2^{23} 1010b - SDCLK x 2^{24} 1011b - SDCLK x 2^{25} 1100b - SDCLK x 2^{26} 1101b - SDCLK x 2^{27} 1110b - SDCLK x 2^{28} 1111b - SDCLK x 2^{29}
15-8 SDCLKFS	SDCLK frequency select This field is used to select the frequency of the SDCLK pin. The frequency is not programmed directly, rather this field holds the prescaler (of this register) and divisor (next register) of the Base Clock Frequency register. In Single Data Rate mode (DDR_EN field of MIXERCTRL is '0') Only the following settings are allowed: 80h) Base clock divided by 256 40h) Base clock divided by 128 20h) Base clock divided by 64 10h) Base clock divided by 32 08h) Base clock divided by 16 04h) Base clock divided by 8 02h) Base clock divided by 4 01h) Base clock divided by 2 00h) Base clock divided by 1 While in Dual Data Rate mode (DDR_EN field of MIXERCTRL is '1') Only the following settings are allowed: 80h) Base clock divided by 512 40h) Base clock divided by 256 20h) Base clock divided by 128 10h) Base clock divided by 64 08h) Base clock divided by 32 04h) Base clock divided by 16 02h) Base clock divided by 8 01h) Base clock divided by 4 00h) Base clock divided by 2

Table continues on the next page...

Table continued from the previous page...

Field	Function
	When the software changes the DDR_EN field, SDCLKFS might need to be changed also. In Single Data Rate mode, setting 00h bypasses the frequency prescaler of the SD clock. Multiple bits must not be set, or the behavior of this prescaler is undefined. The two default divider values can be calculated by the frequency of ipg_perclk and the following Divisor bits. The frequency of SDCLK is set by the following formula: Clock Frequency = (Base Clock) / (prescaler x divisor) For example, in Single Data Rate mode, if the Base Clock Frequency is 96 MHz, and the target frequency is 25 MHz, then choosing the prescaler value of 01h and divisor value of 1h yields 24 MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400 kHz, the prescaler value of 08h and divisor value of eh yields the exact clock value of 400 kHz. The reset value of this field is 80h, so if the input Base Clock (ipg_perclk) is about 96 MHz, the default SD clock after reset is 375 kHz. Before changing clock divisor value (SDCLKFS or DVS), host driver should make sure the SDSTB field is high. If setting SDCLKFS and DVS can generate the same clock frequency,(for example, in SDR mode, SDCLKFS = 01h is same as DVS = 01h.), SDCLKFS is highly recommended.
7-4 DVS	Divisor This field is used to provide a more exact divisor to generate the desired SD clock frequency. Note the divider can even support odd divisors without deterioration of duty cycle. Before changing clock divisor value (SDCLKFS or DVS), Host driver should make sure the SDSTB field is high. The settings are as follows: 0000b - Divide-by-1 0001b - Divide-by-2 1110b - Divide-by-15 1111b - Divide-by-16
3-0 —	Reserved Always write as 1.

81.6.1.14 Interrupt Status (INT_STATUS)

Offset

Register	Offset
INT_STATUS	30h

Function

An interrupt is generated when the normal interrupt signal enable is enabled and at least one of the status fields is set to 1. For all fields, writing 1 to a bit clears it; writing to 0 keeps the bit unchanged. More than one status can be cleared with a single register write. For card interrupt, before writing 1 to clear, it is required that the card stops asserting the interrupt, meaning that when the card driver services the interrupt condition; otherwise, the CINT field is asserted again.

The table below shows the relationship between the command timeout error and the command complete.

Table 815. uSDHC status for command timeout error/command complete bit combinations

Command complete	Command timeout error	Meaning of the status
0	0	X
X	1	Response not received within 64 SDCLK cycles
1	0	Response received

The table below shows the relationship between the transfer complete and the data timeout error.

Table 816. uSDHC status for data timeout error/transfer complete bit combinations

Transfer complete	Data timeout error	Meaning of the status
0	0	X
0	1	Timeout occurred during transfer
1	X	Data transfer complete

The table below shows the relationship between the command CRC error and command timeout error.

Table 817. uSDHC status for command CRC error/command timeout error bit combinations

Command CRC error	Command timeout error	Meaning of the status
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

Fields

Field	Function
31 —	Reserved
30-29 —	Reserved
28 DMAE	DMA error Occurs when an Internal DMA transfer has failed. This field is set to 1, when some error occurs in the data transfer. This error can be caused by either simple DMA or ADMA, depending on which DMA is in use. The value in DMA System Address register is the next fetch address where the error occurs. Because any error corrupts the whole data block, the host driver restarts the transfer from the corrupted block boundary. The address of the block boundary can be calculated either from the current DS_ADDR value or from the remaining number of blocks and the block size. 0b - No error 1b - Error
27 —	Reserved
26 —	Reserved
25 —	Reserved
24 AC12E	Auto CMD12 error Occurs when detecting that one of the fields in the Auto CMD12 Error Status register has changed from 0 to 1. This field is set to 1, not only when the errors in Auto CMD12 occur, but also, when the Auto CMD12 is not executed due to the previous command error.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	0b - No error 1b - Error
23 —	Reserved
22 DEBE	Data end bit error Occurs either when detecting 0 at the end field position of read data that uses the DATA line, or at the end field position of the CRC. 0b - No error 1b - Error
21 DCE	Data CRC error Occurs when detecting a CRC error when transferring read data that uses the DATA line, or when detecting the Write CRC status having a value other than 010. 0b - No error 1b - Error
20 DTOE	Data timeout error Occurs when detecting one of following time-out conditions. • Busy time-out for R1b, R5b type • Busy time-out after Write CRC status • Read Data time-out. 0b - No error 1b - Time out
19 CIE	Command index error Occurs if a command index error occurs in the command response. 0b - No error 1b - Error
18 CEBE	Command end bit error Occurs when detecting that the end field of a command response is 0. 0b - No error 1b - End bit error generated
17 CCE	Command CRC error Command CRC Error is generated in two cases.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	• If a response is returned and the Command Timeout Error is set to 0 (indicating no time-out), this field is set when detecting a CRC error in the command response. • The uSDHC module detects a CMD line conflict by monitoring the CMD line when a command is issued. If uSDHC drives the CMD line to 1, but detects 0 on the CMD line at the next SDCLK edge, then uSDHC aborts the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error should also be set to 1 to distinguish CMD line conflict. 0b - No error 1b - CRC error generated
16 CTOE	Command timeout error Occurs only if no response is returned within 64 SDCLK cycles from the end field of the command. If uSDHC detects a CMD line conflict, in which case a Command CRC Error is also be set (as shown in Interrupt Status (INT_STATUS)), this field is set without waiting for 64 SDCLK cycles. This is because the command is aborted by uSDHC. 0b - No error 1b - Time out
15 ERR_INT_STATUS	Error Interrupt Status This bit is set when any of the error status bit DMAE, AC12E, DEBE, DCE, DTOE, CIE, CEBE, CCE and CTOE is set.
14 —	Reserved
13 —	Reserved
12 —	Reserved
11 —	Reserved
10-9 —	Reserved
8 CINT	Card interrupt This status field is set when an interrupt signal is detected from the external card. In 1-bit mode, uSDHC detects the Card Interrupt without the SD clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so the interrupt from card can only be sampled during interrupt cycle, introducing some delay between the interrupt signal from SDIO and the interrupt to the host system. Writing this field to 1 can clear this field, but as the interrupt source from SDIO does not clear, this field is set again.

Table continues on the next page...

Table continued from the previous page...

Field	Function
	to clear this field, it is required to reset the interrupt source from the external card followed by a writing 1 to this field. When this status has been set, and the host driver needs to service this interrupt, the Card Interrupt Signal Enable in the Interrupt Signal Enable register should be 0 to stop driving the interrupt signal to the host system. After completion of the card interrupt service (It should reset the interrupt sources in SDIO and the interrupt signal might not be asserted), write 1 to clear this field, set the Card Interrupt Signal Enable to 1, and start sampling the interrupt signal again. 0b - No card interrupt 1b - Generate card interrupt
7 CRM	Card removal This status field is set if the Card Inserted field in the Present State register changes from 1 to 0. When the host driver writes this field to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card state might possibly be changed when the host driver clears this field and the interrupt event might not be generated. When this field is cleared, it is set again if no card is inserted. to leave it cleared, clear the Card Removal Status Enable field in Interrupt Status Enable register. 0b - Card state unstable or inserted 1b - Card removed
6 CINS	Card insertion This status field is set if the Card Inserted field in the Present State register changes from 0 to 1. When the host driver writes this field to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card state might possibly be changed when the host driver clears this field and the interrupt event might not be generated. When this field is cleared, it is set again if a card is inserted. to leave it cleared, clear the Card Inserted Status Enable field in Interrupt Status Enable register. 0b - Card state unstable or removed 1b - Card inserted
5 BRR	Buffer read ready This status field is set if the Buffer Read Enable field, in the Present State register, changes from 0 to 1. See the Buffer Read Enable field in the Present State register for additional information. 0b - Not ready to read buffer 1b - Ready to read buffer
4 BWR	Buffer write ready This status field is set if the Buffer Write Enable field, in the Present State register, changes from 0 to 1. See the Buffer Write Enable field in the Present State register for additional information. 0b - Not ready to write buffer 1b - Ready to write buffer
3	DMA interrupt

Table continues on the next page...

Table continued from the previous page...

Field	Function
DINT	Occurs only when the internal DMA finishes the data transfer successfully. Whenever errors occur during data transfer, this field does not be set. Instead, the DMAE field is set. Either Simple DMA or ADMA finishes data transferring, this field is set. 0b - No DMA interrupt 1b - DMA interrupt is generated.
2 BGE	Block gap event If the Stop At Block Gap Request field in the Protocol Control register is set, this field is set when a read or write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this field is not set to 1. In the case of a Read Transaction: This field is set at the falling edge of the DATA Line Active Status (When the transaction is stopped at SD bus timing). The Read Wait must be supported to use this function. In the case of Write Transaction: This field is set at the falling edge of Write Transfer Active Status (After getting CRC status at SD Bus timing). 0b - No block gap event 1b - Transaction stopped at block gap
1 TC	Transfer complete This field is set when a read or write transfer is completed. In the case of a Read Transaction: This field is set at the falling edge of the Read Transfer Active Status. There are two cases in which this interrupt is generated. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the host system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request field in the Protocol Control register (after valid data has been read to the host system). In the case of a Write Transaction: This field is set at the falling edge of the DATA Line Active Status. There are two cases in which this interrupt is generated. The first is when the last data is written to the SD card as specified by the data length and the busy signal is released. The second is when data transfers are stopped at the block gap, by setting the Stop At Block Gap Request field in the Protocol Control register, and the data transfers are completed. (after valid data is written to the SD card and the busy signal released). In the case of a command with busy, this field is set when busy is deasserted. 0b - Transfer does not complete 1b - Transfer complete
0 CC	Command complete This field is set when you receive the end field of the command response (except auto CMD12). See the Command Inhibit (CMD) in the Present State register. 0b - Command not complete 1b - Command complete

81.6.1.15 Interrupt Status Enable (INT_STATUS_EN)

Offset

Register	Offset
INT_STATUS_EN	34h

Function

Setting any bit in this register to 1 enables the corresponding interrupt status be requested to the system. If any bit is set to 0, the corresponding interrupt request gets blocked.

- Depending on IABG field setting, uSDHC might be programmed to sample the card interrupt signal during the interrupt period and hold its value in the flip-flop. There are some delays on the Card Interrupt, asserted from the card, to the time the host system is informed.
- To detect a CMD line conflict, the host driver must set both Command Timeout Error Status Enable and Command CRC Error Status Enable to 1.

81.6.1.16 Interrupt Signal Enable (INT_SIGNAL_EN)

Offset

Register	Offset
INT_SIGNAL_EN	38h

Function

This register is used to select which interrupt status is indicated to the host system as the interrupt. These status fields all share the same interrupt lines. Setting any of these fields to 1 enables interrupt generation. The corresponding Status register field generates an interrupt when the corresponding interrupt signal enable field is set.

Diagram

81.6.1.17 Auto CMD12 Error Status (AUTOCMD12_ERR_STATUS)

Offset

Register	Offset
AUTOCMD12_ERR_STATUS	3Ch

Function

When the Auto CMD12 Error Status field in the Status register is set, the host driver checks this register to identify what kind of error the Auto CMD12 / CMD 23 indicated. Auto CMD23 errors are indicated in field 04-01. This register is valid only when the Auto CMD12 Error status field is set.

The table below shows the relationship between the Auto CMGD12 CRC Error and the Auto CMD12 Command Timeout Error.

Table 818. Relationship between command CRC error and command timeout error for auto CMD12

Auto CMD12 CRC error	Auto CMD12 timeout error	Type of error
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

Changes in Auto CMD12 Error Status register can be classified in three scenarios:

- When uSDHC is going to issue an Auto CMD12
  - Set field 0 to 1 if the Auto CMD12 cannot be issued due to an error in the previous command
  - Set field 0 to 0 if the Auto CMD12 is issued
- At the end field of an Auto CMD12 response
  - Check errors correspond to fields 1-4
  - Set fields 1-4 corresponding to detected errors
  - Clear fields 1-4 corresponding to detected errors
- Before reading the Auto CMD12 Error Status field 7
  - Set field 7 to 1 if there is a command that can't be issued
  - Clear field 7 if there is no command to issue

The timing for generating the Auto CMD12 Error and writing to the Command register are asynchronous. After that, field 7 is sampled when the driver is not writing to the Command register. So, it is suggested to read this register only when the AC12E field in Interrupt Status register is set. An Auto CMD12 Error Interrupt is generated when one of the error fields (0-4) is set to 1. The Command Not Issued By Auto CMD12 Error does not generate an interrupt.

Fields

Field	Function
31-8 —	Reserved
7 CNIBAC12E	Command not issued by Auto CMD12 error Setting this field to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error (D04-D01) in this register. 0b - No error 1b - Not issued
6-5 —	Reserved
4 AC12IE	Auto CMD12 / 23 index error Occurs if the command index error occurs in response to a command. 0b - No error 1b - Error, the CMD index in response is not CMD12/23
3 AC12EBE	Auto CMD12 / 23 end bit error Occurs when detecting that the end field of command response is 0 which should be 1. 0b - No error 1b - End bit error generated
2 AC12CE	Auto CMD12 / 23 CRC error Occurs when detecting a CRC error in the command response. 0b - No CRC error 1b - CRC error met in Auto CMD12/23 response
1 AC12TOE	Auto CMD12 / 23 timeout error Occurs if no response is returned within 64 SDCLK cycles from the end field of the command. If this field is set to1, the other error status fields (2-4) have no meaning. 0b - No error 1b - Time out
0 AC12NE	Auto CMD12 not executed If memory multiple block data transfer is not started, due to a command error, this field is not set because it is not necessary to issue an Auto CMD12. Setting this field to 1 means uSDHC cannot issue the Auto CMD12 to stop a memory multiple block data transfer due to some error. If this field is set to 1, other error status fields (1-4) have no meaning. 0b - Executed 1b - Not executed

81.6.1.18 Host Controller Capabilities (HOST_CTRL_CAP)

Offset

Register	Offset
HOST_CTRL_CAP	40h

Function

This register provides the host driver with information specific to uSDHC implementation. The value in this register is the power-on-reset value and does not change with a software reset.

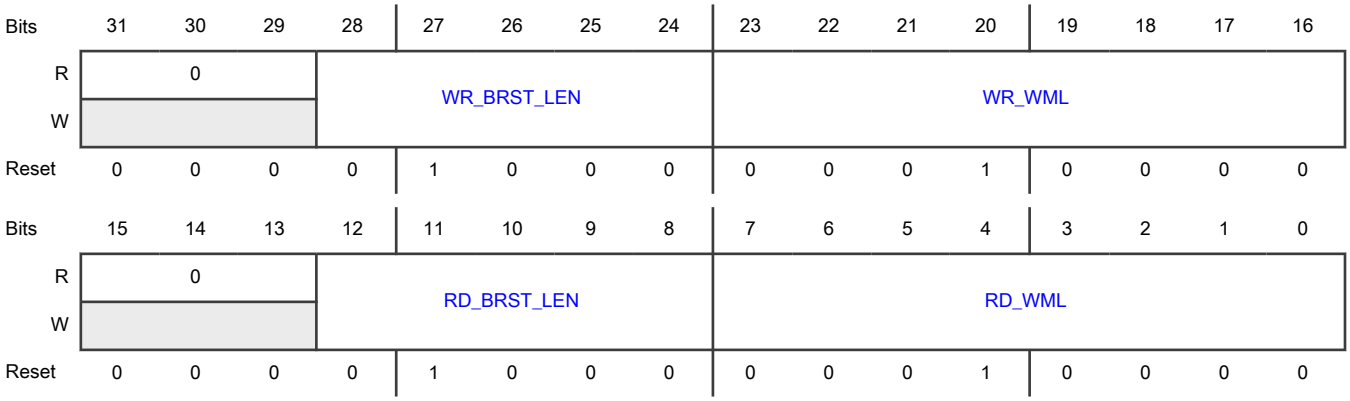
WTMK_LVL	44h

Function

This register indicates configurability of write and read watermark levels (FIFO threshold). Their value can range from 1 to 128 words. Both write and read burst lengths are also configurable. Their value can range from 1 to 31 words.

Diagram



Fields

Field	Function
31-29 —	Reserved
28-24 WR_BRST_LEN	Write burst length due to system restriction, the actual burst length might not exceed 16 This field indicates the number of words uSDHC writes in a single burst. The write burst length must be less than or equal to the write watermark level, and all bursts within a watermark level transfer is in back-to-back mode. On reset, this field is 8. Writing 0 to this field results in '01000' (that is, it is not able to clear this field).

Table continues on the next page...

Table continued from the previous page...

Field	Function
23-16 WR_WML	Write watermark level This field indicates the number of words used as the watermark level (FIFO threshold) in a DMA write operation. Also, the number of words as a sequence of write bursts in back-to-back mode. The maximum legal value for the write watermark level is 128.
15-13 —	Reserved
12-8 RD_BRST_LEN	Read burst length due to system restriction, the actual burst length might not exceed 16 This field indicates the number of words uSDHC reads in a single burst. The read burst length must be less than or equal to the read watermark level, and all bursts within a watermark level transfer is in back-to-back mode. On reset, this field is 8. Writing 0 to this field results in '01000' (that is, it is not able to clear this field).
7-0 RD_WML	Read watermark level This field indicates the number of words used as the watermark level (FIFO threshold) in a DMA read operation. Also, the number of words as a sequence of read bursts in back-to-back mode. The maximum legal value for the read water mark level is 128.

81.6.1.20 Mixer Control (MIX_CTRL)

Offset

Register	Offset
MIX_CTRL	48h

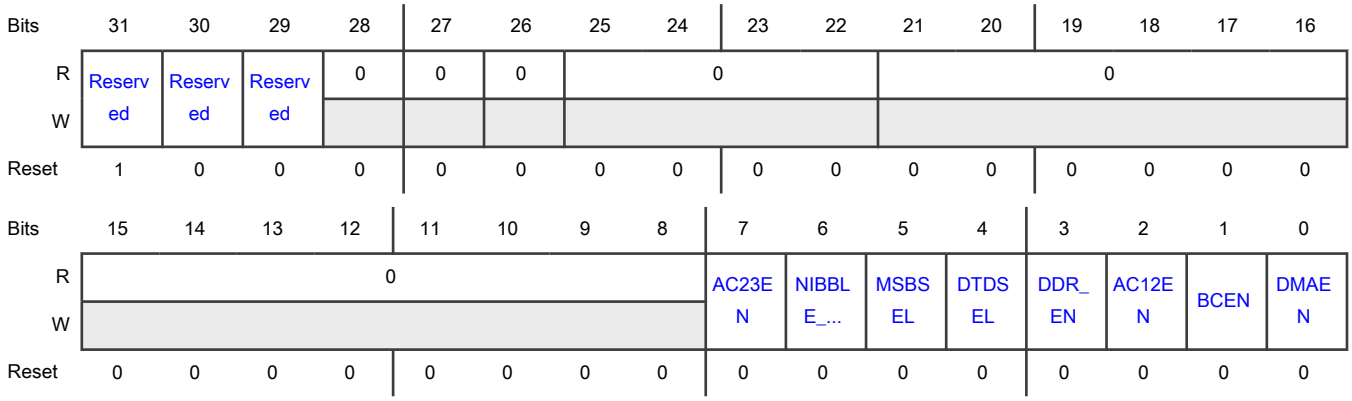
Function

This register is used to DMA and data transfer. To prevent data loss, the software should check if data transfer is active before writing this register. These fields are DPSEL, MBSEL, DTDSEL, AC12EN, BCEN, and DMAEN.

Table 819. Transfer type register setting for various transfer types

Multi/single block select	Block count enable	Block count	Function
0	Do not care	Do not care	Single transfer
1	0	Do not care	Infinite transfer
1	1	Positive number	Multiple transfer
1	1	Zero	No data transfer

Diagram



Fields

Field	Function
31 —	Reserved Always write as 1.
30 —	Reserved Always write as 0.
29 —	Reserved Always write as 0.
28 —	Reserved
27 —	Reserved
26 —	Reserved
25-22 —	Reserved
21-8 —	Reserved
7 AC23EN	Auto CMD23 enable This field is read/write when VEND_SPEC[CMD_BYTE_EN] is disabled; otherwise, this field is read-only. When this field is set to 1, the host controller issues a CMD23 automatically before issuing a command specified in the Command Register.
6	Nibble position indication

Table continues on the next page...

Table continued from the previous page...

Field	Function
NIBBLE_POS	This field indicates the nibble position in the DDR 4-bit mode. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is disabled; otherwise, this field is read-only. 0- the sequence is 'odd high nibble -> even high nibble -> odd low nibble -> even low nibble'; 1- the sequence is 'odd high nibble -> odd low nibble -> even high nibble -> even low nibble'.
5 MSBSEL	Multi / Single block select This field enables multiple block DATA line data transfers. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is disabled; otherwise, this field is read-only. For any other commands, this field can be set to 0. If this field is 0, it is not necessary to set the Block Count register. See Command Transfer Type (CMD_XFR_TYP). 0b - Single block 1b - Multiple blocks
4 DTDSEL	Data transfer direction select This field defines the direction of DATA line data transfers. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is disabled; otherwise, this field is read-only. The field is set to 1 by the host driver to transfer data from the SD card to uSDHC and is set to 0 for all other commands. 0b - Write (Host to card) 1b - Read (Card to host)
3 DDR_EN	Dual data rate mode selection This field is read/write when VEND_SPEC[CMD_BYTE_EN] is disabled; otherwise, this field is read-only.
2 AC12EN	Auto CMD12 enable Multiple block transfers for memory require a CMD12 to stop the transaction. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is disabled; otherwise, this field is read-only. When this field is set to 1, uSDHC issues a CMD12 automatically when the last block transfer has completed. The host driver is not set this field to issue commands that do not require CMD12 to stop a multiple block data transfer. In particular, secure commands defined in File Security Specification (see reference list) do not require CMD12. In single block transfer, uSDHC ignores this field no matter it is set or not. 0b - Disable 1b - Enable
1 BCEN	Block count enable This field is used to enable the Block Count register, which is only relevant for multiple block transfers. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is disabled; otherwise, this field is read-only. When this field is 0, the internal counter for block is disabled, which is useful in executing an infinite transfer. 0b - Disable 1b - Enable
0 DMAEN	DMA enable

Table continues on the next page...

Table continued from the previous page...

Field	Function
	This field enables DMA functionality. This field is read/write when VEND_SPEC[CMD_BYTE_EN] is disabled; otherwise, this field is read-only. If this field is set to 1, a DMA operation begins when the host driver sets the DPSEL field of this register. Whether the simple DMA or the advanced DMA is active depends on the DMA Select field of the Protocol Control register. 0b - Disable 1b - Enable

81.6.1.21 Force Event (FORCE_EVENT)

Offset

Register	Offset
FORCE_EVENT	50h

Function

This register is not a physically implemented register. Rather, it is an address at which the Interrupt Status register can be written if the corresponding field of the Interrupt Status Enable Register is set. This register is a write only register and writing 0 to it has no effect. Writing 1 to this register sets the corresponding field of Interrupt Status register. A read from this register always results in 0's. to change the corresponding status fields in the Interrupt Status register, make sure to set IPGEN field in System Control Register so that peripheral clock is always active.

Forcing a card interrupt generates a short pulse on the DATA1 line, and the driver might treat this interrupt as a normal interrupt. The interrupt service routine might skip polling the card interrupt factor as the interrupt is self cleared.

Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15-8 —	Reserved
7 FEVTCNIBAC12E	Force event command not executed by Auto Command 12 error Forces the CNIBAC12E field in the Auto Command12 Error Status register to be set
6-5 —	Reserved
4 FEVTAC12IE	Force event Auto Command 12 index error Forces the AC12IE field in the Auto Command12 Error Status register to be set
3 FEVTAC12EBE	Force event Auto Command 12 end bit error Forces the AC12EBE field in the Auto Command12 Error Status register to be set
2 FEVTAC12CE	Force event auto command 12 CRC error Forces the AC12CE field in the Auto Command12 Error Status register to be set
1 FEVTAC12TOE	Force event auto command 12 time out error Forces the AC12TOE field in the Auto Command12 Error Status register to be set
0 FEVTAC12NE	Force event auto command 12 not executed Forces the AC12NE field in the Auto Command12 Error Status register to be set

81.6.1.22 ADMA Error Status (ADMA_ERR_STATUS)

Offset

Register	Offset
ADMA_ERR_STATUS	54h

Function

When an ADMA Error Interrupt has occurred, the ADMA error sates field in this register holds the ADMA state and the ADMA System Address register holds the address around the error descriptor.

For recovering from this error, the host driver requires the ADMA state to identify the error descriptor address as follows:

- ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address.
- ST_FDS: Current location set in the ADMA System Address register is the error descriptor address.

- ST_CADR: This state is never set because it only increments the descriptor pointer and does not generate an ADMA error.
- ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address.

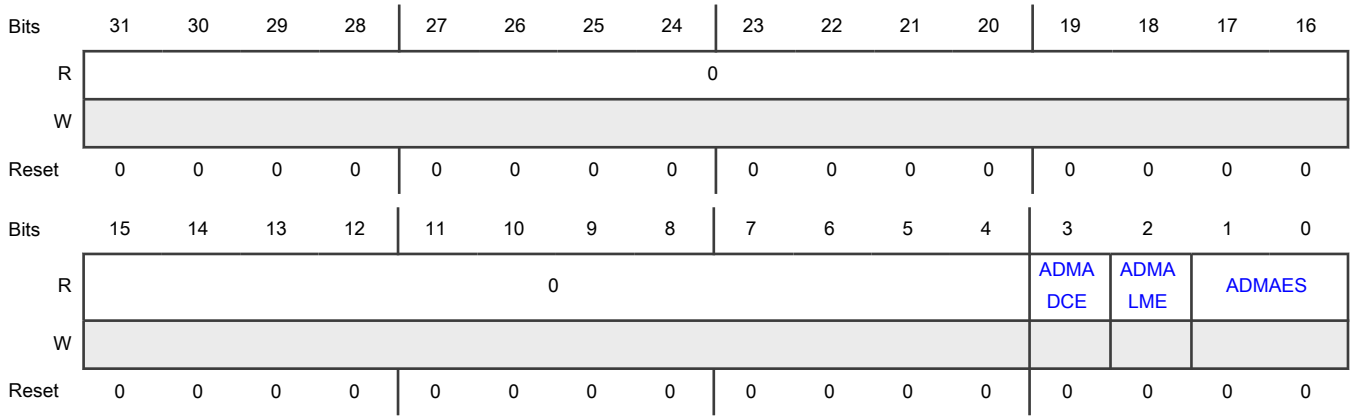
In case of a write operation, the host driver should use the ACMD22 to get the number of the written block, rather than using this information, because unwritten data might exist in the host controller.

The host controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) in the ST_FDS state. The host driver can distinguish this error by reading the Valid field of the error descriptor.

Table 820. ADMA error state coding

D01-D00	ADMA error state (when error has occurred)	Contents of ADMA System Address register
00	ST_STOP (Stop DMA)	Holds the address of the next executable descriptor command
01	ST_FDS (Fetch descriptor)	Holds the valid descriptor address
10	ST_CADR (Change address)	No ADMA error is generated
11	ST_TFR (Transfer data)	Holds the address of the next executable descriptor command

Diagram



Fields

Field	Function
31-4 —	Reserved
3 ADMADCE	ADMA descriptor error This error occurs when invalid descriptor fetched by ADMA. 0b - No error 1b - Error

Table continues on the next page...

Table continued from the previous page...

Field	Function
2 ADMALME	ADMA length mismatch error This error occurs in the following two cases: • While the block count enable is being set, the total data length specified by the descriptor table is different from that specified by the block count and block length. • Total data length cannot be divided by the block length. 0b - No error 1b - Error
1-0 ADMAES	ADMA error state (when ADMA error is occurred) This field indicates the state of the ADMA when an error has occurred during an ADMA data transfer. See ADMA Error Status (ADMA_ERR_STATUS) for more details.

81.6.1.23 ADMA System Address (ADMA_SYS_ADDR)

Offset

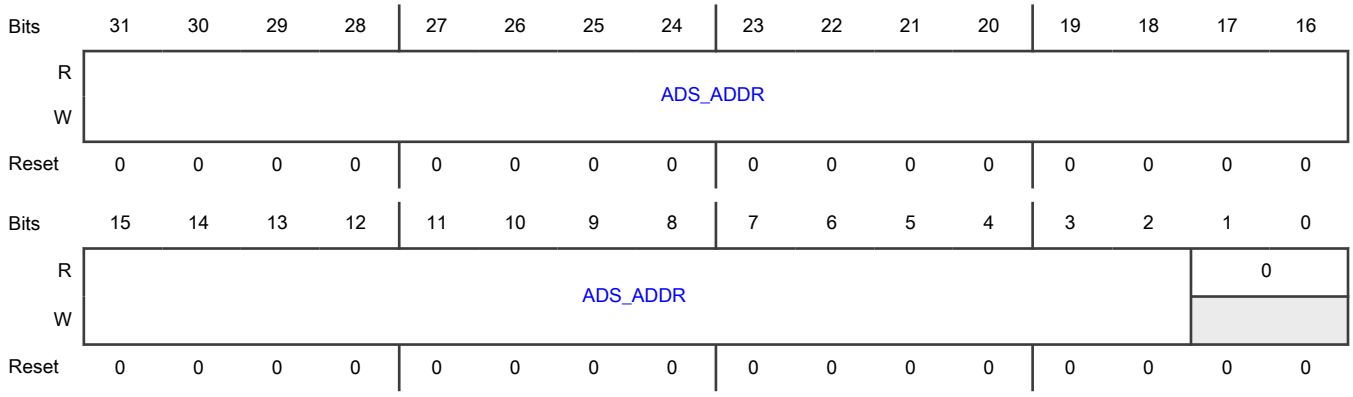
Register	Offset
ADMA_SYS_ADDR	58h

Function

This register holds the word address of the executing command in the Descriptor table. At the start of ADMA, the host driver sets the start address of the Descriptor table. The ADMA engine increments this register address whenever fetching a Descriptor command. When the ADMA is stopped at the Block Gap, this register indicates the address of the next executable Descriptor command. When the ADMA Error Interrupt is generated, this register holds the valid Descriptor address depending on the ADMA state. The lower 2 bits of this register is tied to '0' so the ADMA address is always word aligned.

Because this register supports dynamic address reflecting, when TC field is set, it automatically alters the value of internal address counter, so the software cannot change this register when TC field is set. Such restriction is also listed in Software restrictions.

Diagram



Fields

Field	Function
31-2 ADS_ADDR	ADMA system address This field contains the physical system memory address used for ADMA transfers.
1-0 —	Reserved

81.6.1.24 DLL (Delay Line) Control (DLL_CTRL)

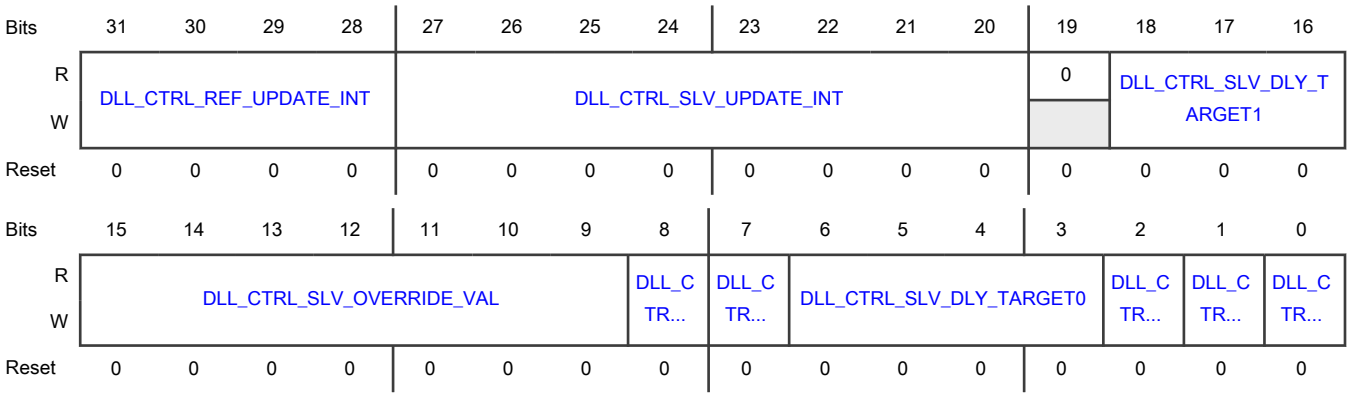
Offset

Register	Offset
DLL_CTRL	60h

Function

This register contains control fields for DLL.

Diagram



Fields

Field	Function
31-28 DLL_CTRL_REF_UPDATE_INT	DLL control loop update interval The interval cycle is (2 + REF_UPDATE_INT) * REF_CLOCK. By default, the DLL control loop updates every two REF_CLOCK cycles. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that might effect the delay (such as voltage and temperature)
27-20	Slave delay line update interval

Table continues on the next page...

Table continued from the previous page...

Field	Function
DLL_CTRL_SLV_UPDATE_INT	If default 0 is used, it means 256 cycles of REF_CLOCK. A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line also updates automatically when the reference DLL transitions to a locked state (from an un-locked state).
19 —	Reserved
18-16 DLL_CTRL_SLV_DLY_TARGET1	DLL slave delay target1 See DLL_CTRL_SLV_DLY_TARGET0 below.
15-9 DLL_CTRL_SLV_OVERRIDE_VAL	DLL slave override val When SLV_OVERRIDE = 1, this field is used to select 1 of 128 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 128.
8 DLL_CTRL_SLV_OVERRIDE	DLL slave override Set this field to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE field. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE = 0
7 DLL_CTRL_GATE_UPDATE	DLL gate update Set this field to 1 to prevent the DLL from updating (because when clock_in exists, glitches might appear during DLL updates). This field might be used by software if such a condition occurs. Clear the bit to 0 to allow the DLL to update automatically.
6-3 DLL_CTRL_SLV_DLY_TARGET0	DLL slave delay target0 The delay target for uSDHC loopback read clock can be programmed in 1/16th increments of an ref_clock half-period. The delay is (({DLL_CTRL_SLV_DLY_TARGET1,DLL_CTRL_SLV_DLY_TARGET0} +1)* REF_CLOCK / 2) / 16 So the input read-clock can be delayed relative input data from (REF_CLOCK / 2) / 16 to REF_CLOCK * 4. **NOTE** For the restrictions of delay cell implementation, the delay target must be set between REF_CLOCK/16 and REF_CLOCK*2 when REF_CLOCK is running at 200 MHz. When REF_CLOCK frequency is slower than 100 MHz, the maximum delay target might not reach REF_CLOCK*2.
2 DLL_CTRL_SLV_FORCE_UPD	DLL slave delay line Setting this field to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line updates automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered). Be sure to use it when uSDHC is idle. This function might not work when uSDHC is working on data / cmd / response.

Table continues on the next page...

Table continued from the previous page...

Field	Function
1 DLL_CTRL_RESET	DLL reset Setting this field to 1 force a reset on DLL. This causes the DLL to lose lock and re-calibrate to detect an REF_CLOCK half period phase shift. This signal is used by the DLL as edge-sensitive, so to create a subsequent reset, RESET must be taken low and then asserted again.
0 DLL_CTRL_ENABLE	DLL and delay chain Set this field to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.

81.6.1.25 DLL Status (DLL_STATUS)

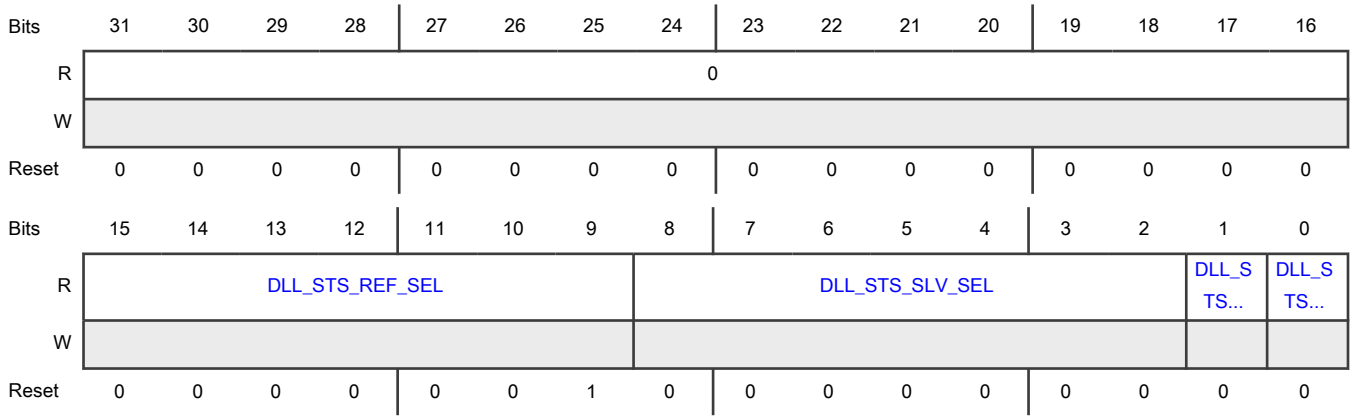
Offset

Register	Offset
DLL_STATUS	64h

Function

This register contains the DLL status information. All fields are read only and reads the same as the power-reset value.

Diagram



Fields

Field	Function
31-16 —	Reserved
15-9	Reference delay line select taps

Table continues on the next page...

Table continued from the previous page...

Field	Function
DLL_STS_REF_SEL	This is encoded by 7 fields for 127 taps.
8-2 DLL_STS_SLV_SEL	Slave delay line select status This is the instant value generated from reference chain. Because the reference chain can only be updated when REF_CLOCK is detected, this value should be the right value to be updated when the reference is locked.
1 DLL_STS_REF_LOCK	Reference DLL lock status This signifies that the DLL has detected and locked to a half-phase ref_clock shift, allowing the slave delay-line to perform programmed clock delays
0 DLL_STS_SLV_LOCK	Slave delay-line lock status This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value

81.6.1.26 Vendor Specific Register (VEND_SPEC)

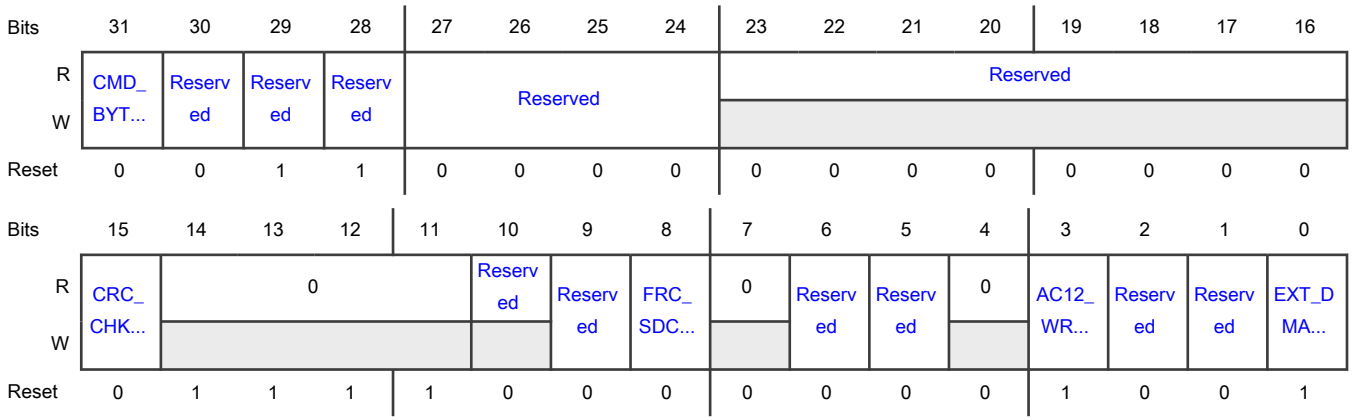
Offset

Register	Offset
VEND_SPEC	C0h

Function

This register contains the vendor specific control/status register.

Diagram



Fields

Field	Function
31 CMD_BYTE_EN	Register byte access for CMD_XFR_TYP This field controls the register byte access for Command Transfer Type (CMD_XFR_TYP). If this field is enabled, the register can be configured through byte write enable. IPS_bus can write only one byte once for one write operation. 0b - Disable. MIX_CTRL[7:0] is read/write and CMD_XFR_TYP[7:0] is read-only. 1b - Enable. MIX_CTRL[7:0] is read-only and CMD_XFR_TYP[7:0] is read/write.
30 —	Reserved Always write as 0.
29 —	Reserved Always write as 1
28 —	Reserved Always write as 0.
27-24 —	Reserved Always write as 4'b0000.
23-16 —	Reserved Always write as 8'h00.
15 CRC_CHK_DIS	CRC Check Disable 0b - Check CRC16 for every read data packet and check CRC fields for every write data packet 1b - Ignore CRC16 check for every read data packet and ignore CRC fields check for every write data packet
14-11 —	Reserved Reserved
10 —	Reserved Always write as 0.
9 —	Reserved Always write as 0.
8 FRC_SDCLK_ON	Force CLK Force CLK output active Do not set this bit to 1 unless it is necessary. Also, make sure that this bit is cleared when uSDHC's clock is about to be changed (frequency change, clock source change, or delay chain tuning). 0b - CLK active or inactive is fully controlled by the hardware. 1b - Force CLK active

Table continues on the next page...

Table continued from the previous page...

Field	Function
7 —	Reserved
6 —	Reserved
5 —	Reserved
4 —	Reserved
3 AC12_WR_CHKBUSY_EN	Check busy enable Check busy enable after auto CMD12 for write data packet 0b - Do not check busy after auto CMD12 for write data packet 1b - Check busy after auto CMD12 for write data packet
2 —	Reserved
1 —	Reserved
0 EXT_DMA_EN	External DMA request enable Enable the request to external DMA. When the internal DMA (either Simple DMA or Advanced DMA) is not in use, and this field is set, uSDHC sends out DMA request when the internal buffer is ready. This field is particularly useful when transferring data by Arm platform polling mode, and it is not allowed to send out the external DMA request. By default, this field is set. 0b - In any scenario, uSDHC does not send out external DMA request. 1b - When internal DMA is not active, the external DMA request is sent out.

81.6.1.27 eMMC Boot (MMC_BOOT)

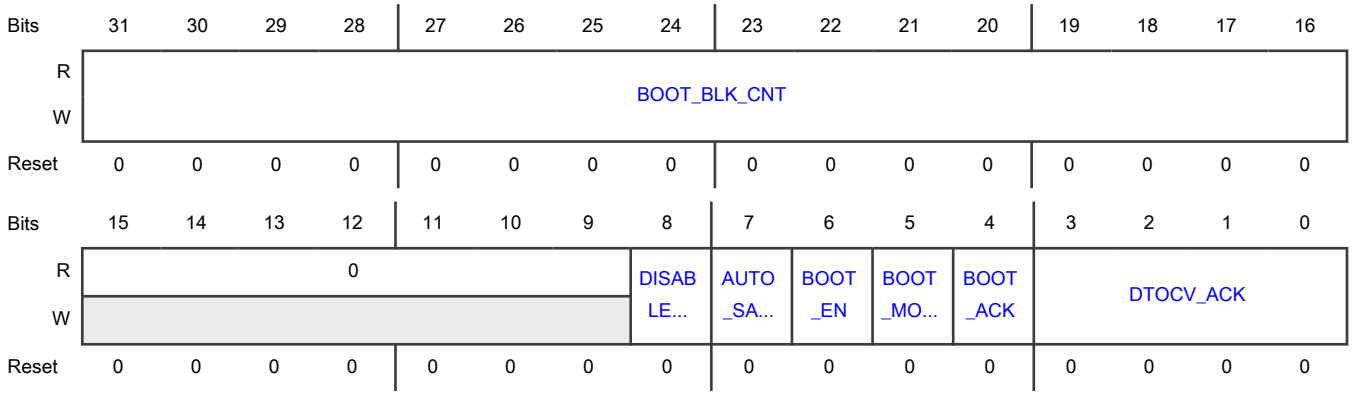
Offset

Register	Offset
MMC_BOOT	C4h

Function

This register contains the eMMC Fast Boot control register.

Diagram



Fields

Field	Function
31-16 BOOT_BLK_CNT	Stop At Block Gap value of automatic mode The value defines the Stop At Block Gap value of automatic mode. When received, card block cnt is equal to (BLK_CNT - BOOT_BLK_CNT) and AUTO_SABG_EN is 1, then Stop At Block Gap. Here, BLK_CNT is defined in the Block Attributes Register, field 31 - 16 of 0x04.
15-9 —	Reserved
8 DISABLE_TIME_OUT	Time out **NOTE** When this field is set, there is no timeout check no matter whether BOOT_EN is set or not. 0b - Enable time out 1b - Disable time out
7 AUTO_SABG_EN	Auto stop at block gap During boot, enable auto stop at block gap function. This function is triggered, and host stops at block gap when received card block cnt is equal to (BLK_CNT - BOOT_BLK_CNT).
6 BOOT_EN	Boot enable Boot mode enable 0b - Fast boot disable 1b - Fast boot enable
5 BOOT_MODE	Boot mode Boot mode select 0b - Normal boot 1b - Alternative boot

Chapter 82
Debug Subsystem

82.1 Introduction

This chapter discusses the debug and trace architecture of the chip that is based on the specifications provided in the *Arm® CoreSight™ SoC-400 Technical Reference Manual*. See References for a link to this document and to other related documentation available on the Arm website.

The chip architecture includes debug and trace modules. See Features for details on the debug and trace features that Cortex-M7 core clusters support.

The debug components that the Cortex-M7 core supports are accessible via the Arm DAP controller-based architecture. The DAP controller works in parallel with the system JTAGC. Both these controllers share the JTAG port and JTAG instruction set.

The system components are similar for different chips in the same family and include the primary core debug interfaces, the chip-level debug interfaces, and chip-level trace interfaces. The accelerator components include debug and trace circuits. These circuits are necessary for any application-specific accelerators required for the different application spaces that a chip supports. They vary from one chip to another and could include only trace components.

82.3 Block diagram

This figure illustrates the DAP architecture of the S32K3xx family.

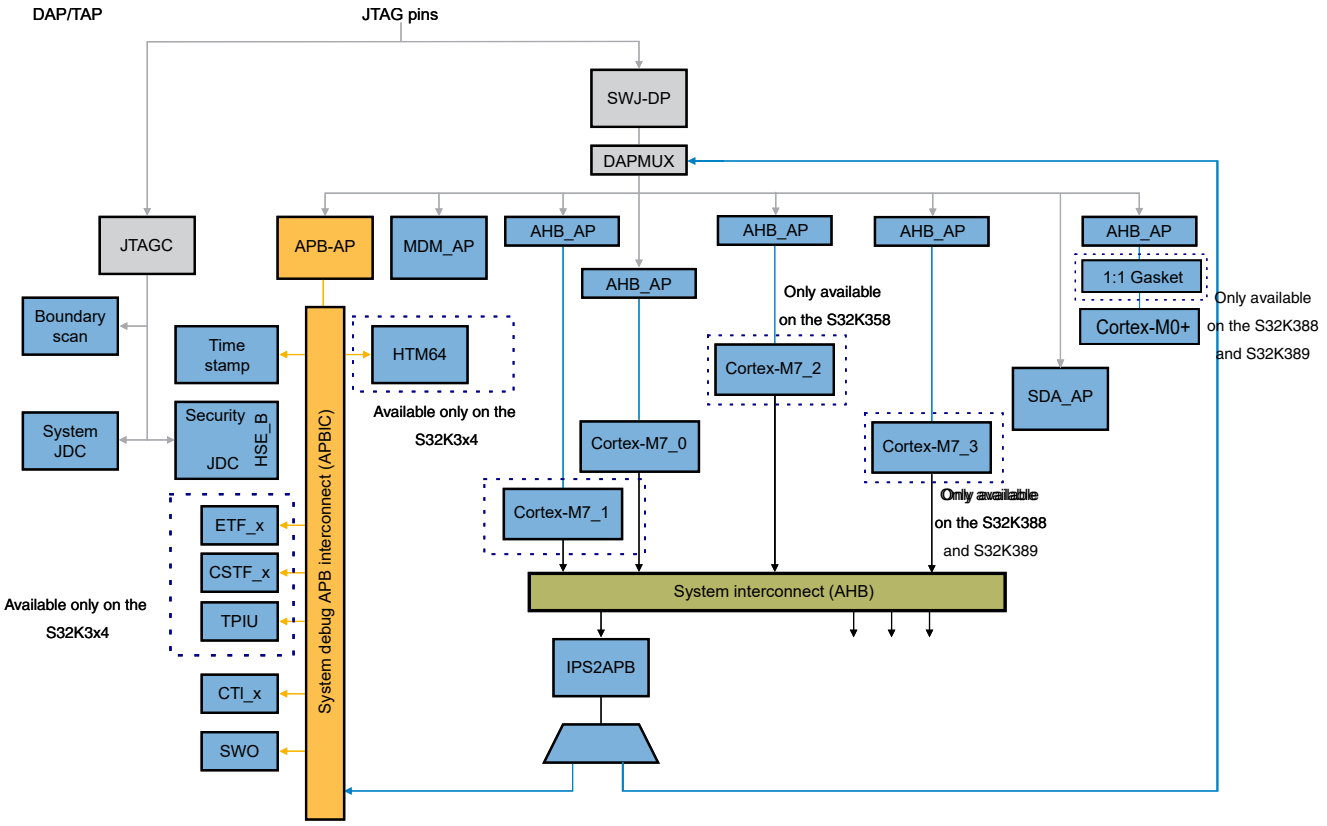

Figure 555. DAP architecture

NOTE

Debug components other than the Cortex-M0+ core are accessible through software path (CORE > AXBS > AIPS > DAPMUX > APs), that is, by directly specifying the memory mapped addresses without doing challenge response.

82.4 Features

This chip includes these features that support the functions listed under each feature type:

- Debug control
  - Is implemented via IEEE 1149.1-compliant JTAG
- Test control
  - Is implemented via IEEE 1149.1-compliant JTAG
  - Uses IEEE 1149.6 extension to IEEE 1149.1
- Trace interface
  - Includes four high-speed data pads and one clock pad up to 125 MHz (125 MB/s throughput per pad)
  - Includes 16 low-speed data pads and one clock pad @25 MHz (100 MB/s throughput per pad)
- Debug security
  - Includes a DAP/TAP interface that controls all debug features and is gated by Cortex M0+ JDC module

  - Includes security modes as described in the "Security" chapter
- Debugging and run control
  - Is implemented through stopping points, starting points, breakpoints, and watchpoints
  - Each Cortex-M7 core supports eight instruction comparators and a watchpoint unit having four watchpoints
- Trace source
  - Includes Cortex-M7:
    - ETM that provides instruction and data trace
    - ITM that provides DWT, time-stamping, and diagnostic information
- Cross-triggering support
  - Controls run-control options of cores based on other cores
  - Provides a matrix having connections to:
    - HTM via system CTI
    - All Cortex-M7 CPUs
- Ability to view and modify all memory-mapped areas that are not otherwise blocked—includes a system bus debug access port
- Performance monitoring of cores—implements a performance monitoring unit (PMU) on each Cortex core
- Safety
  - Supports monitoring of debug signals to avoid common mode faults
  - Allows checking of erroneous activation of debugging, especially if intrusive (for example, a CPU entering Debug state)
- Timestamps
  - Generates a timestamp bus for distribution to the trace sources
  - Includes a 48-bit binary timestamp bus
  - Clocks timestamp generator by a frequency given in Table 829

82.5 Debug

82.5.1 TAP connectivity

This figure shows a detailed view of TAP connectivity. JTAG select, SWJ-DP, and JTAG-DP are parts of DAP.

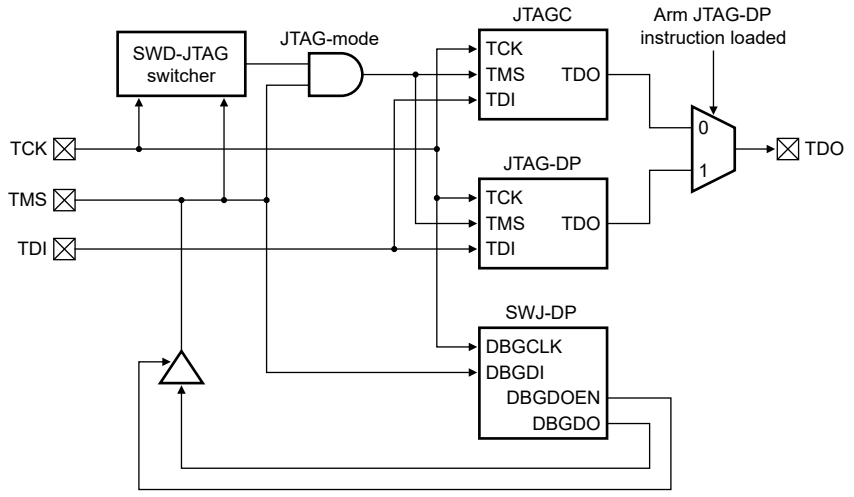

Figure 556. TAP connectivity

The debug port comes out of reset in a standard JTAG mode. It switches to another mode by using the change sequences. After the mode changes, unused debug pins can be reassigned to any of their alternative muxed functions.

JTAG-DP and JTAGC are connected in an overlay scheme and both have an Instruction Register (IR) length of 8 bits.

82.5.2 DAP TAP

DAP is an Arm component that provides multiple-master driving ports. A single external interface port accesses and controls these ports to provide system-wide debug.

The DAP Instruction Register (DAP IR) overlays with the system JTAG Instruction Register (JTAGC IR). Table 822 presents DAP instructions. In addition to the four codes listed in the table, DAP uses BYPASS, which is identical to JTAGC BYPASS and is therefore not shown in the table.

Table 822. DAP IR codes

Code	DAP IR
1111_1000b	ABORT
1111_1010b	DPACC
1111_1011b	APACC
1111_1110b	IDCODE

DAP offers an AHB master interface to access system buses. It also exports the internal DAP bus to extend the access ports. For more information on DAP TAP, see the *Arm Debug Interface Architecture Specification* document available in References.

In this chip:

- The AHB slave ports of all Cortex-M*x* cores provide debugger access to all memory units and registers in the system.
- The new pass-through approach allows the debugger to see a cache coherent view of the memory map for that core.
- The debugger must access the corresponding AHB_AP port to access the AHB-S port of that subsystem.
- XRDC controls system access.
- A core can access the debug components of another core through a DAPMUX to the bus interconnect.
- The exported DAP bus hosts AHB_AP and MDM_AP.

— MDM_AP hosts system-level JTAG status and control registers. These registers can be used for cross triggering, synchronized debug, and other miscellaneous control and status functions.

— APB_AP uses an APSEL value of 1h to access any APB-mapped debug modules.

Table 826 describes the access addresses of APB-mapped debug modules. The value of the DAP select signal in the APSEL field of SWJ-DP's Select register selects the access ports in the DAP. Table 823 shows APSEL decoding.

Table 823. DAP master address mapping

DAP master #	DAP component	DAPBUS base address (access from debugger) [1]	System memory map address (access from cores)		Selected port or master	Applicability
			Page number	Base address		
0h	Reserved	0000_0000h	0	4025_0000h	Reserved	-
1h	APB_AP to all APB-mapped debug modules (for example, ETFs, HTM, and trace funnels)	0100_0000h	0	4025_0100h	APB_AP to all APB-mapped debug modules (for example, ETFs, HTM, CSTF, and so on)	All (for ETF, HTM, and CSTF see Table 821).
2h	Reserved	0200_0000h	0	4025_0200h	Reserved	-
3h	AHB_AP to Cortex-M7_2 debug modules and chip system memory map	0300_0000h	0	4025_0300h	AHB_AP to Cortex-M7_2 debug modules and chip system memory map	S32K358, S32K338, S32K388, S32K389
4h	AHB_AP to Cortex-M7_0 debug modules and chip system memory map	0400_0000h	0	4025_0400h	AHB_AP to Cortex-M7_0 debug modules and chip system memory map	All
5h	AHB_AP to Cortex-M7_1 debug modules and chip system memory map	0500_0000h	0	4025_0500h	AHB_AP to Cortex-M7_1 debug modules and chip system memory map	S32K344, S32K324, S32K322, S32K358, S32K388, S32K389
6h	MDM_AP	0600_0000h	0	4025_0600h	MDM_AP	All
7h	SDA_AP	0700_0000h	0	4025_4700h	SDA_AP used for challenge-response (CR) in SWJ-DP mode	All

Table continues on the next page...

Table 823. DAP master address mapping (continued)

DAP master #	DAP component	DAPBUS base address (access from debugger) [1]	System memory map address (access from cores)		Selected port or master	Applicability
			Page number	Base address		
8h	AHB_AP to Cortex-M7_3 debug modules and chip system memory map	0800_0000h	0	4025_0700h	AHB_AP to Cortex-M7_3 debug modules and chip system memory map	S32K388, S32K389
9h—FFh	Reserved (default AP response)	—	—	—	—	—

1. For example, 4025_XXYYh address is provided when accessing access ports (APs) via the core. Here, XX shows the AP select number and YY shows the address to be accessed. If you access MDM_AP via the cores on 4h, you must provide the address 4025_0604h

NOTE

Accessing SDA_AP simultaneously from the core and the debugger is prohibited. If you try to do so, you may receive unpredictable responses to core-initiated transactions (for example, incorrect data read, a failed attempt to write to the register, or a transfer error). Debugger-initiated transactions proceed correctly.

82.5.3 System JTAGC

JTAGC connects in parallel with the TAP controller (JTAG-DP of DAP), which has an IR length of 8 bits. The JTAGC IR codes overlay the ones of the DAP controller. DAP uses four instructions and JTAGC uses the remaining ones. The TAP outputs (TPOs) are multiplexed based on the selected IR code. This chip is fully JTAG-compliant and appears as a single TAP to the JTAG chain.

This table shows the JTAGC IR codes. The instructions that are used by Arm DAP TAP are shown in Table 822.

Table 824. JTAG instructions for JTAGC

Code	JTAGC IR
0000_0000b	IDCODE
0000_0001b	Reserved
0000_0010b	SAMPLE/PRELOAD
0000_0011b	SAMPLE
0000_0100b	EXTEST
0000_0101b	HI-Z
0000_0110b	Reserved
0000_0111b	Reserved

Table continues on the next page...

Table 824. JTAG instructions for JTAGC (continued)

82.5.3.1 Chip JTAG/Target ID

Each chip in the S32K3xx family includes a unique JTAG ID, which must be changed when instantiated with a different die in an SiP. The next table shows the JTAGC ID for this chip.

Table 825. JTAG/Target ID

Chip	PRN	DC	PIN	MIC	IDCODE ID	JTAG ID	Target ID
S32K344	0	26h (38d)	160h (352d)	Eh (14d)	1	0996_001Dh	0995_C01Dh
S32K324	0	26h (38d)	160h (352d)	Eh (14d)	1	0996_001Dh	0996_001Dh
S32K314	0	26h (38d)	160h (352d)	Eh (14d)	1	0996_001Dh	0996_001Dh

82.5.3.2 JDC

JDC allows you to access two 32-bit data registers by using the JTAG interface and by software running on one of the CPUs in the chip. These registers exchange data between an internal CPU and an external debug tool.

82.5.4 Peripheral IPG debug implementation

Any core can control a peripheral instance individually. You define the core's control over a peripheral during application development.

For peripheral halt, all individual cores have the same capability and are gated by a dedicated MDM_AP core halt register field. For more information, see the configurations defined in MDM_AP register descriptions.

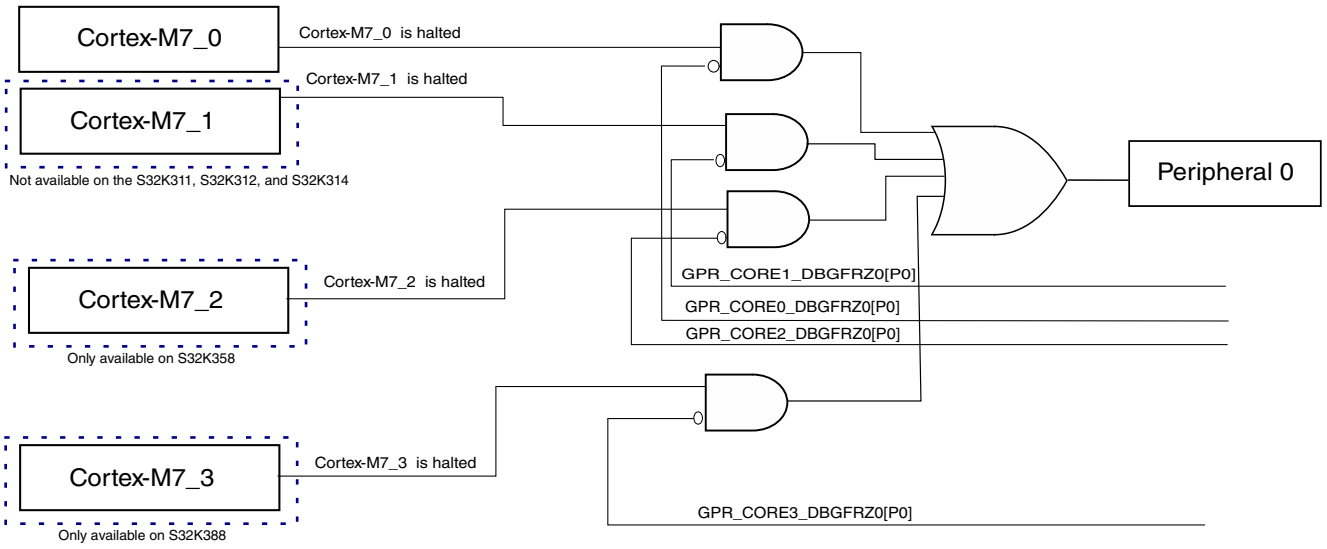

Figure 557. Peripheral IPG debug implementation

82.5.5 Application debugging

This section covers the following two cases:

- Case 1: Debugger connected—application debugging from the first instruction
- Case 2: Debugger not connected

82.5.5.1 Application debugging from first instruction

This chip supports debugging from the first instruction on system power-up, destructive reset, functional reset, and standby exit. However, by default, debugging from the first instruction is disabled.

The next figure shows the timing diagram of application debug implementation from first instruction on system power-up or destructive reset.

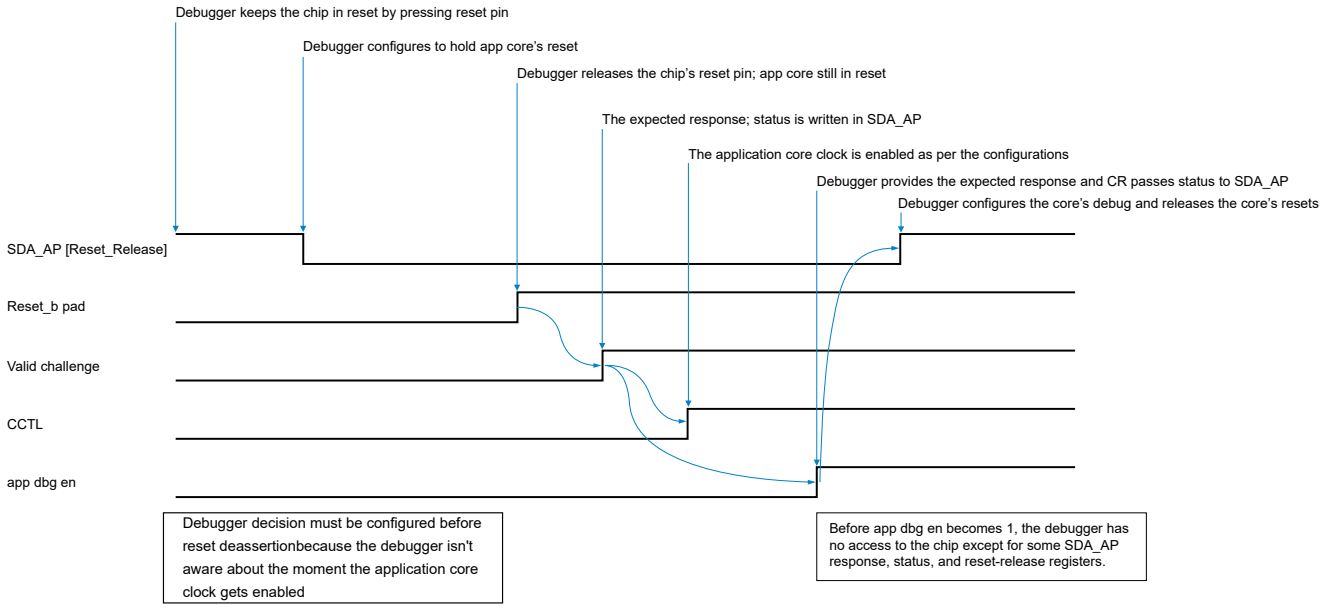

Figure 558. Application debug implementation from first instruction

These are the steps involved in enabling application debug from the first instruction on system power-up or destructive reset. Similar steps are to be performed for application debugging for core Cortex-M7_2 and core Cortex-M7_3 as applicable.

1. After the reset is applied, the debugger provides an option to debug from the first instruction. To do this:
   a. Write 1 to SDAAPRSTCTRL[RSTRELTLCM70] and SDAAPRSTCTRL[RSTRELTLCM71].
   b. Set the reset value of Reset Control (SDAAPRSTCTRL).
2. Cortex M0+ starts after the reset pin is released.
3. Debugger challenge-response (CR) starts.
4. Cortex-M7 cores remain in reset until MC_ME's PRTN0_COREx_PCONF[CCE] field becomes 1 for respective Cortex-M7 core.
5. When BAF or FW writes 1 to MC_ME's PRTN0_CORE0_PCONF[CCE] field for Cortex-M7_0 and to PRTN0_CORE1_PCONF[CCE] field for Cortex-M7_1, and the debugger CR has passed:
   - If the value of SDAAPRSTCTRL[RSTRELTLCM71] and SDAAPRSTCTRL[RSTRELTLCM70] is 0 for their respective cores, the debugger configures the core debug registers and then enables these fields that start the code execution.
   - If the value of SDAAPRSTCTRL[RSTRELTLCM71] and SDAAPRSTCTRL[RSTRELTLCM70] is 1 for their respective cores, the debugger configures the core debug registers and then enables these fields that start the code execution.

To debug from the first instruction during the low-power debug protocol, the debugger:

1. Writes 0 to SDAAPRSTCTRL[RSTRELTLCM71] and SDAAPRSTCTRL[RSTRELTLCM70] for their respective cores.
2. Writes 1 to MDMAPWIRREL[WTRSTRGM].

82.5.5.1.1 Debug from first instruction on functional reset onwards

If you enable debug, on functional reset, the debug connection is retained. That is because the complete debug infrastructure is on destructive reset domain.

82.5.5.1.2 Debug on standby exit by wake-up or functional reset

If you enable debug before standby entry, then the Standby domain stores the final status. The configuration for reset release is reset (SDA_AP.SDAAPRSTCTRL[RSTRELTLCM70], SDA_AP.SDAAPRSTCTRL[RSTRELTLCM71] and SDA_AP.SDAAPRSTCTRL[RSTRELTLCM72]. The reset value of the three fields is 1), which defaults to debug from the first instruction disabled.

You must configure the reset release on standby exit. It uses MC_RGM's low-power debug protocol before ungating the reset deassertion.

82.5.5.2 Debugger not connected

If the debugger is not connected, the value of the DBGPWRUP_ACK signal is 0 as there is no DBGPWRUP_REQ. This results in the following scenario:

1. The booting core writes 1 to MC_ME's PRTN0_CORE0_PCONF[CCE] field for Cortex-M7_0, PRTN0_CORE1_PCONF[CCE] field for Cortex-M7_1, PRTN0_CORE4_PCONF[CCE] field for Cortex-M7_2, and PRTN0_CORE3_PCONF[CCE] field for Cortex-M7_3 (as per core's availability).
2. The application core starts running. In case of Lock-step mode, the checker core executes the same code after a delay of two cycles.

82.5.6 Debugger considerations while flash program/erase

The flash programming can be done by application cores as well as debugger. The debugger can program/erase flash using either of the following two options:

1. Loading the program/erase code to SRAM from the debugger and then executing the program/erase sequence by application code from SRAM.
   - Debugger is connected and authenticated.
   - The debugger loads the code in the form of application binary image into the on-chip SRAM.
   - The debugger then initiates the application core to execute the binary from SRAM.
2. Debugger executing the program/erase sequence.
   - Debugger is connected and authenticated.
   - The debugger then initiates the flash programming by reading/writing the registers involved and following the program/erase sequence.

First option is the recommended because of less execution time. In second option, the debugger is the master and since the debug interface is serial, the execution takes more time.

In some cases, you might experience flash program/erase failure due to flash watchdog timeout when debugger executes the flash program/erase sequence due to the serial interface. Therefore, it is recommended to use the first option. In case second option is required, it should be performed in reduced clocking options (Option E and E2 only. For details, refer to the **Clocking details** section in the **Clocking** chapter).

82.5.7 SWJ-DP sequence for debug authentication

To perform the SWJ-DP sequence for debug authentication, the debugger:

1. Polls the AUTHSTTS[CHALRDY] field until it indicates the challenge status.
2. Reads Key Challenge (KEYCHAL0 - KEYCHAL7) if the challenge is valid and creates an authenticated 256-bit response key.
3. Writes a 256-bit response key to Key Response (KEYRESP0 - KEYRESP7).
4. Indicates that the response is ready by configuring AUTHCTL[HSEAUTHREQ].
5. Checks the status of Authentication Status (AUTHSTTS) to evaluate if the operation is successful.

If the authentication process is successful and the debugger has write access to Debug Enable Control (DBGENCTRL), the challenge or response is considered successful too.

NOTE

SDA_AP supports challenge and response based on both JTAG and SWJ-DP modes. See SDAAPGENCTRL0[JTAG_CR_EN] for details.

82.6 APB memory map

You can access the debug registers via the APB_AP bus. The next table shows all the addresses for the CoreSight APB components and the addressing used for accessing the DAP components via the memory interface. You can also access all APB registers from the processing cores.

Table 826. APB components mapping

Debug APB component	APBIC base address (access from debugger)	System memory map address (access from cores)		Memory allocation (KB)	APB-AP0 slot number	Applicability
		Page number	Base address			
APB_AP ROM table	F8h	0	4024_00F8h	4	APBIC base	All

Timestamp CTL	C000h	3	4024_C000h	4	11	All

Funnel 0 should be configure to buffer the data coming from the different sources, to avoid padding data with null packets that affect the bandwidth.

82.7 Trace

82.7.1 Trace modules and connectivity

The Trace subsystem:

- Combines trace data from all internal clients that generate trace information
- Includes a 32-bit TPIU
- Includes these components:
  - ATB
  - ATBR
  - CSTF
  - Debug APB

— ETF

— TPIU

Multiple options for trace output allow parallel tracing. Trace information can be read from the trace interface or the DAP interface, and traces can be alternatively read out from ETF at a slow speed via APB_AP. Table 827 shows EFT sizes.

Table 827. ETF sizes

FIFO	Memory interface data width (in bits)	Size (KB)Applicable for All, except S32K388	Size (KB)Applicable for S32K388
Cortex-M7 ETM/ITM cluster ETF	64	1	4
Cortex-M7 ETMD cluster ETF	128	2	4
HTM ETF	64	1	2
Shared system ETF	64	2	4

NOTE

- The DMA-HTM trace supports four words at 80 MHz. For HTM trace, both DBGENCTRL[GSPNIDEN] and DBGENCTRL[GSPIDEN] must be 1.
- Enabling any one of data trace causes overflow inside ETM and trace packets get dropped. Enabling instruction trace of both the core simultaneously does not cause any overflow.

Control (MDMAPCTL) provides fields to override the speed control (see Table 828 for details) from some of the trace sinks (and TPIU). The complete trace pipeline bandwidth is limited by the slowest sink component. The default settings of these fields allow maximum bandwidth for the TPIU to trace. When tracing to memory (if supported), the fields may need to be changed.

Table 828. Trace output overrides

Trace destination	SWO_override	TPIU_override
TPIU	1	0

The trace sources of the chip are the cores and their related modules. Trace funnels exist for all possible trace clients. For more information on the various components in the trace bus connectivity, see the *CoreSight Components Technical Reference Manual* (available in References). See Table 829 for details on funnel assignments.

The ATBR is integrated to send a shared funnel output across TPIU. This figure illustrates the chip's detailed trace architecture.

82.7.1.1 Chip's bus trace client

Chips in the S32K3xx family include a bus trace client.

HTM provides the address and data trace information about AXBS buses. The information from an HTM can be used with the debugger to enable easy, accurate debugging on AXBS-based embedded systems. The chip implements an HTM64 configuration to trace 64-bit AXBS masters in the system. To simplify the implementation, instead of tracing the individual ports of various AXBS masters and slaves, which may be running at different frequencies, HTM64 snoops the AXBS crossbar master ports that are all synchronous with a 160 MHz system clock. This table provides details related to the HTM input connectivity.

Table 830. HTM connections

HTM64 port	AHB crossbar port
HTMBUSSELECT0	M0 AXBS_Lite XBIC (DMA)
HTMBUSSELECT1	M3 AXBS (Ethernet)
HTMBUSSELECT2[1]	M6 AXBS (Ethernet 2)

1. Only applicable for S32K388 and S32K389.

82.7.1.2 TPIU interface

A standard 16-bit parallel TPIU is integrated into the debug subsystem. Chips in the S32K3xx family generate the trace via the trace port.

To prevent instruction trace from being dropped in a multi-core environment, a TPIU throughput of 55.2 MB/s or higher must be maintained. You could use these pin and frequency combinations:

- Four high-speed data + one clock pads @120 MHz (240 Mbit/s throughput per pad) totaling 120 MB/s

- 16 low-speed data + one clock pads @25 MHz (50 Mbit/s throughput per pad) totaling 100 MB/s

High-end chips from the S32K3xx family support at least 56 MB/s of trace throughput on the TPIU interface.

Table 831. Throughput for S32K388

Core	Throughput value
Cortex-M7_0	31.06 MB/s
Cortex-M7_1	31.06 MB/s
Cortex-M7_2	31.06 MB/s
Cortex-M7_3	31.06 MB/s
Total	124.24 MB/s

Table 832. Throughput for all chips except S32K388

Core	Throughput value	Applicability
Cortex-M7_0	27.6 MB/s	S32K344, S32K324, S32K314 S32K358, S32K348, S32K338, S32K328
Cortex-M7_1	27.6 MB/s	S32K338, S32K328, S32K324
Cortex-M7_2	27.6 MB/s	S32K358, S32K338
Total	82.8 MB/s	

82.7.1.3 TPIU flush

To allow the chip to enter Standby mode, software executes an WFI instruction indicating Standby entry. When the chip enters this mode, MC_RGM asserts a trace flush request to the TPIU and waits for a trace flush done signal from the TPIU before requesting MC_PCU to proceed. The TPIU and debug infrastructure clocks can be gated after this. Because the TPIU is sourced from system clock, the clock must not be gated until this point.

82.7.1.4 Trace through reset

All debug and trace components (HTM, ETM, ETF, and so on) are on destructive reset. When tracing through reset, the clock switches from PLL to FIRC. It is recommended to preserve the following pad configurations across reset, which are performed through MDMAPCTL[DBGRSTFASTPAD] and MDMAPCTL[DBGRSTSLOWPAD]:

- Four high-speed data + one clock pads @120 MHz (240 Mbits/s throughput per pad) totaling 120 MB/s
- 16 low-speed data + one clock pads @25 MHz (50 Mbits/s throughput per pad) totaling 100 MB/s

The implementation involves writing 1 to MDMAPCTL[DBGRSTFASTPAD] or MDMAPCTL[DBGRSTSLOWPAD], depending on which set of trace pads you need to enable. These fields also control:

- The trace pad mux.
- The "obe" of the trace pads, which, if configured, is retained over functional reset because the reset is controlled using the above-mentioned corresponding fields.

82.8 Embedded cross trigger (ECT)

ECT allows multi-core run control and trace cross-triggering, such as synchronous stop-start for all cores or trigger trace on a trigger event from another core or module. See the *CoreSight Components Technical Reference Manual* (available in References) for detailed information on ECT.

ECT architecture involves CTMs and CTIs. The CTIs provide a cross-triggering interface between the cores and other debug and trace modules. The channels of these CTIs are interconnected using CTMs, as shown in this figure.

The following figure shows ECT

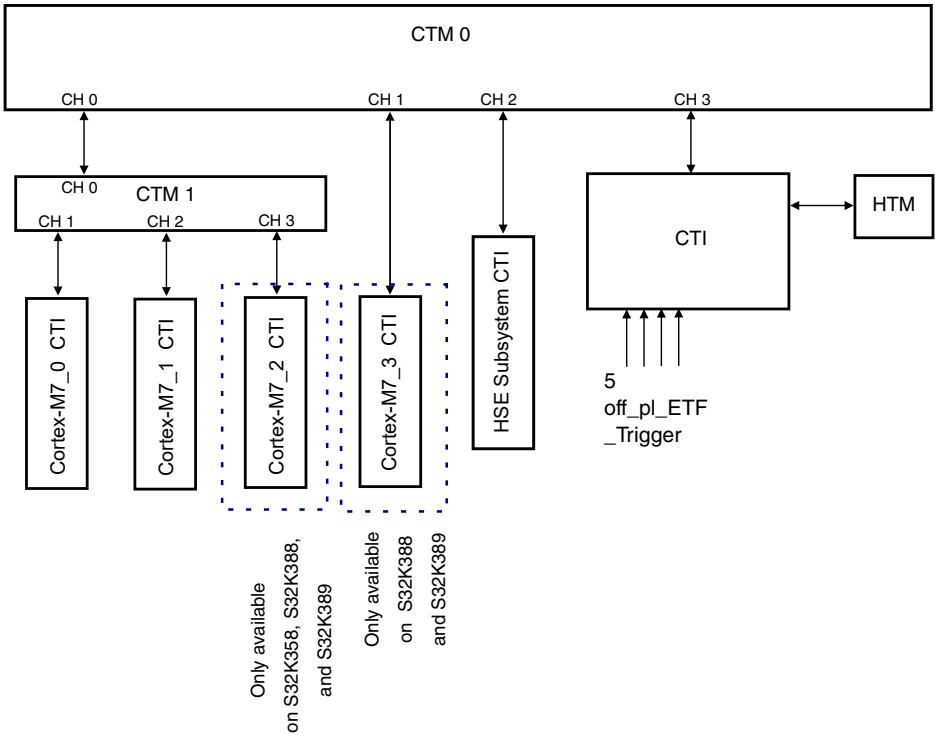

Figure 565. ECT

82.8.1 CTI assignments

Table 833. CTI assignments

CTI instance	Trigger number	Trigger in	Trigger out
CTI_Cortex-M7_0	7	ETM event output 3	Processor restart
	6	ETM event output 2	ETM event input 3
	5	ETM event output 1	ETM event input 2
	4	ETM event output 0	ETM event input 1

	2	HTM trigger out 2	HTM trigger in 1
	1	HTM trigger out 1	HTM trigger in 0
	0	HTM trigger out 0	Reserved

82.9 Low-power debug handshake protocol

The debugger must perform this sequence to enter or exit Standby mode, if the debugger handshake is enabled:

1. Power on DAP.

The debugger connection is established.

2. Configure the Debug subsystem for the relevant operations.
3. Write 1 to MDMAPWIREN[LWPWREN] to gate entry into Standby mode with the debugger handshake.
4. Disable POR_WDG for monitoring the entry to or exit from Standby mode by writing 1 to DCM's DCMRWP1[8] field. This is required for low-power debug handshake because debugger configurations can be more time consuming than the POR_WDG threshold levels and can raise a false POR_WDG event.
5. Write 1 to DCMRWF1[STANDBY_IO_CONFIG] in the Device Configuration Module (DCM). This causes padkeeping to be disabled on standby entry itself without any software dependency. This is needed in case of low-power debug since otherwise the padkeeping on TDO would result in no debugger communication. In other cases, DCMRWF1[STANDBY_IO_CONFIG] should be configured as 0 before standby entry.
6. Initiate entry into Standby mode. See the "Power Management" chapter for the Standby mode entry sequence and configurations.
7. Identify whether the low-power debug is enabled on the low-power entry.
   - If low-power debug is enabled and TPIU is enabled too, trace flush starts, and the debugger acknowledges the following:
     - Low-power debug traces
     - DAP-related configuration reception and context saving

       After this, the chip enters Standby mode.
   - If TPIU is disabled:
     - The debugger acknowledges DAP-related configuration reception and context saving by writing 1 to MDMAPWIRREL[PRVNTRSTRGM].

       After this, the chip enters Standby mode.
   - If low-power debug is disabled, the chip enters Standby mode without waiting for debugger acknowledgment.

   On any wakeup event, the chip starts the Standby mode exit sequence described in the "Power Management" chapter. After the chip exits Standby mode, the debugger connection is restored. By this time, the debugger is already aware that it has enabled the low-power debug handshake. In this case, the debugger must poll MDMAPSTTS[DESTRST] to check whether:
   - The debug infrastructure is out of reset.
   - The DAP connection can be established.

   After DAP is powered on (the debugger connection is established), the debugger:
   a. Reconfigures the debug and trace attributes using the fields in DBGENCTRL
   b. Writes 1 to MDMAPWIRREL[WTRSTRGM] after the debugger trace context is restored

      The chip exits Standby mode.

      If low-power debug is not configured, the chip exits Standby mode without waiting for the debugger to write to MDMAPWIRREL[WTRSTRGM].
8. Reconfigure the debug and trace configuration in SDA_AP register descriptions after the chip exits Standby mode.

NOTE

If the chip wakes up from Standby mode through pad reset, the debugger must perform a CR again.

82.10 Debug resets

The debug subsystem follows this sequence on the source of reset:

1. POR resets the complete debug logic.

2. The destructive reset resets all types of debug logic except JTAGC.

Conversely, the debug subsystem can generate a system reset using these mechanisms:

- System destructive reset defined in Control (MDMAPCTL) that allows the debugger to provide the destructive reset to the system. The debugger loses connection to the system with this reset.
- System functional reset defined in Control (MDMAPCTL) that allows the debugger to hold the system in functional reset.

To program various debug registers, the functional clocks must be enabled. All debug and trace components must be on destructive reset.

82.11 Debug across device LifeCycles

The debug access to the system is available in early lifecycles and subsequently based on NVM configuration settings.

After the debug is set to 'Trusted', the system access is allowed after a successful authorization step between the debugger and the system.

The authorization provides provisions to allow debug for Cortex M0+ core and Cortex M7 cores.

Following table shows the debug access based on various configuration bits.

Table 834. Debug access based on LifeCycle and bit configurations

LifeCycle	Debug access
	Appl Core Debug
MCU_PROD	Open
	Open
CUST_DEL	Open
	Open
OEM_PROD	Closed
	Trusted
	Trusted
	Disabled
IN_FIELD	Closed
	Trusted
	Trusted
	Disabled
PRE_FA	Trusted
	Trusted
FA	Open

NOTE

1. **Open:** Debug is always possible
2. **Trusted:** Debug is possible after successful authentication (Challenge/Response handshake with correct credentials)
3. During functional reset, the debug-enable will retain its last status, while DCM scans NVM for lifecycle and DCF values. Debug status will be re-evaluated once dcm_done gets 1.
4. During temporary advancement of lifecycle, debug-en will immediately reflect the status based on updated lifecycle/DCF bits.

82.12 Pin interface

This table presents a summary of functional and power pins that are used for debugging purposes.

Table 835. Pin interface

Pin type	Pins	Number of pins (balls)[1]	Nominal voltage
Functional JTAG	JCOMP, TCK, TMS, TDI, TDO	Five (only TDI and TDO can be multiplexed with GPIO or other functions)	3.3 V, 5 V
Functional trace pins (parallel trace)	TRACE_CLK	One	3.3 V, 5 V
	TRACE_D[15:0]	16	3.3 V, 5 V
Ground	VSS	See the IOMUX file attached to this document for information on the number of VSS pins in various packages.	0 V

1. The terms pins and balls are used interchangeably. Some chip packages include pins and others include balls.

NOTE

Fast Trace pad TRACE_D[15:0] is available only in S32K344.

82.12.1 Debug port and pin descriptions

The pads to which the debug signals are mapped operate using the JTAG functionality out of reset but can later be reassigned to their alternate functionalities. TDI and TDO can operate as alternate GPIO functions. See this table for pin assignments in different modes.

Table 836. Debug port pins

Pin name	JTAG debug port		Internal pullup or pulldown logic
	Type	Description	
TMS	I/O	JTAG test mode selection (TMS)	Pullup
TCK/SWCLK	I	JTAG test clock (TCK)	Pulldown
TDI	I	JTAG test data input (TDI)	Pullup
TDO/TRACESWO	O	JTAG test data output (TDO)	Not connected

82.12.2 Trace port pin descriptions

This chip generates trace via TPIU that transmits the trace data out of the chip over a parallel trace port. The trace port consists of an ETM trace clock and 16 parallel trace data outputs. The Arm optional trace port control (TRACECTRL), debug request (DBGRQ), and debug acknowledge (DBGACK) signals are not implemented.

Table 837. Trace output port pins

Pin name	Description
TRACE_DATA00	ETM parallel trace data output 01
TRACE_DATA01	ETM parallel trace data output 01
TRACE_DATA02	ETM parallel trace data output 02
TRACE_DATA03	ETM parallel trace data output 03
TRACE_DATA04	ETM parallel trace data output 04
TRACE_DATA05	ETM parallel trace data output 05
TRACE_DATA06	ETM parallel trace data output 06
TRACE_DATA07	ETM parallel trace data output 07
TRACE_DATA08	ETM parallel trace data output 08
TRACE_DATA09	ETM parallel trace data output 09
TRACE_DATA10	ETM parallel trace data output 10
TRACE_DATA11	ETM parallel trace data output 11
TRACE_DATA12	ETM parallel trace data output 12
TRACE_DATA13	ETM parallel trace data output 13
TRACE_DATA14	ETM parallel trace data output 14
TRACE_DATA15	ETM parallel trace data output 15
TRACE_CLK	ETM parallel trace clock output

NOTE

ETM is supported in S32K344 only

NOTE

By default, Rx pins float and are not pulled inside. An internal active pulldown logic exists only when you enable Rx via software (IBE).

82.13 Timestamp distribution network

The timestamp distribution network uses CoreSight timestamp components to generate a 48-bit timestamp value for the trace sources, as shown in the next figure. The CoreSight timestamp generator generates a 64-bit counter value, but only the least significant 48 bits are distributed to the trace sources. A 7-bit narrow timestamp is derived from the 48-bit timestamp and distributed to the trace client, where a decoder regenerates the 48-bit timestamp. The generator must be programmed, and you could find the related programming information in the *CoreSight Components Technical Reference Manual* (available in References).

This chip supports 48-bit timestamping. The generator operates at a frequency of up to 320 MHz and gives a 64-bit timestamp value. .

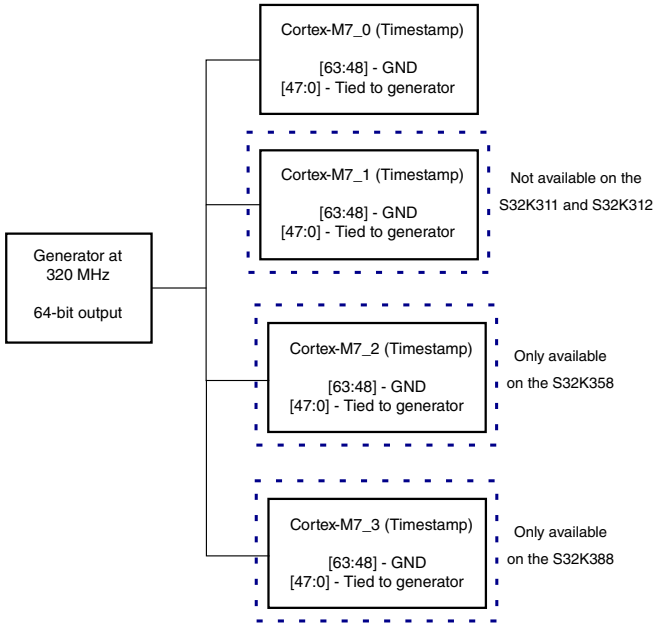

Figure 566. Timestamp distribution network

82.14 Peripheral debug freeze register descriptions

Implement the logic provided in this section for each peripheral instance supporting the debug operation.

NOTE

Debug freeze is enabled for all the peripherals so that as soon as the core halts, peripherals can be frozen to support debugging from the first instruction.

For register details, refer to the following registers in the Device Configuration Module (DCM):

- Read Write GPR On Destructive Reset Register (DCMRWD6)
- Read Write GPR On Destructive Reset Register (DCMRWD7)
- Read Write GPR On Destructive Reset Register (DCMRWD8)
- Read Write GPR On Destructive Reset Register (DCMRWD9)

82.15 MDM_AP register descriptions

The debugger has access to the status and control elements implemented as registers in MDM_AP, which is selected by APSEL (6h) on the DAP bus. These registers provide additional control and status information for typical debug, cross-triggering, and run-control scenarios. Also, the register fields provide a way for the debugger to get the updated status of the core without initiating a bus transaction across the crossbar switch, thus remaining less intrusive during a debug session.

MDM_AP is accessible as DAP (see DAP TAP for details).

82.15.1 MDM_AP memory map

MDM_AP base address: 4025_0600h

Offset	Register	Width (In bits)	Access	Reset value

82.15.3 Control (MDMAPCTL)

Offset

Register	Offset
MDMAPCTL	4h

Function

Allows the debugger:

- To give the destructive reset to the system. A system destructive reset enables this. The debugger also loses connection to the system with this reset.
- To hold the system in functional reset. A system functional reset enables this.

NOTE

- The trace functionality on trace pins is selected with this register and is retained across the functional reset.
- For S32K388, you must always write:
  - Bitfields 18 and 19 in conjunction.
  - Write bitfields 16 and 17 in conjunction if lockstep is enabled for Cortex-M7_0 and Cortex-M7_1.
- For S32K358, S32K348, S32K338, S32K328, S32K342, S32K341, S32K322, S32K344, S32K324, and S32K314, write bitfields 16 and 17 in conjunction if lockstep is enabled for Cortex-M7_0 and Cortex-M7_1.

1 PRVNTRSTRGM	Prevent Reset Indicates if MC_RGM is prevented from generating reset. After TPIU flush, this field prevents MC_RGM from generating reset even if MC_RGM receives an acknowledge response from TPIU. This is valid for low-power entry. 0b - Normal operation 1b - MC_RGM prevented
0 WTRSTRGM	Wait In Reset B Indicates if waiting of MC_RGM from generating reset is supported. On exiting Standby mode, MC_RGM waits until the debugger writes to another field in the MDM_AP register to allow it to exit reset. 0b - Normal operation 1b - Wait supported

82.16 SDA_AP register descriptions

The debugger and system have access to secure authentication control and status, implemented as registers in SDA_AP on the DAP bus. These registers provide authentication control, authentication status, key exchange information, and debug enable controls.

82.16.1 SDA_AP memory map

SDA_AP base address: 4025_4700h

Offset	Register	Width (In bits)	Access	Reset value

Chapter 83
JTAG Controller (JTAGC)

83.1 Chip-specific JTAGC information

The following figure shows the detailed TAP connectivity. SWD/JTAG SELECT, SWDP and JTAG-DP are part of ARM DAP

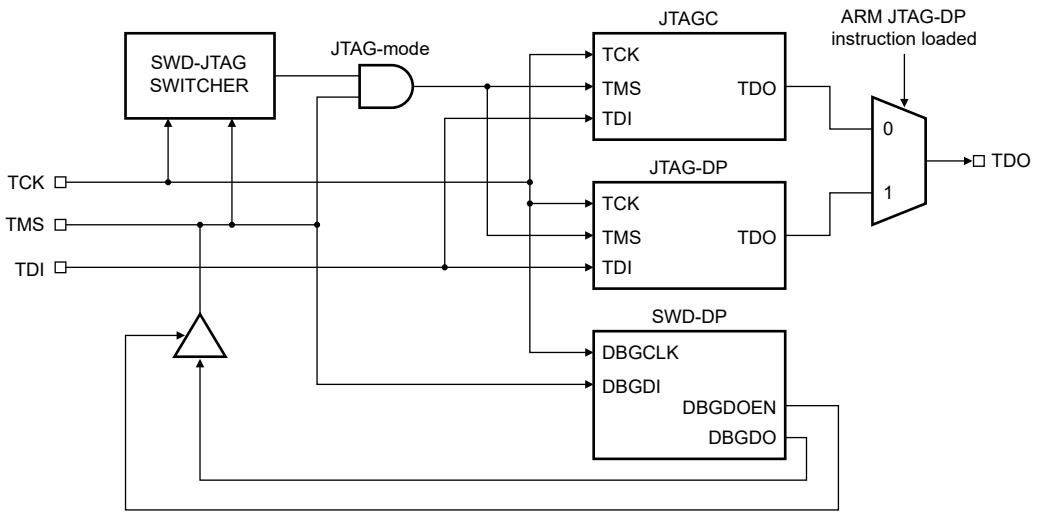

Figure 567. Test and Debug Access Port (TAP) connectivity

The debug port comes out of reset in a standard JTAG mode. It is switched to SWD mode by the change sequences described in JTAG to SWD change sequence . Once the mode has been changed, unused debug pins can be reassigned to any of their alternative muxed functions

JTAG-to-SWD change sequence:

1. Send more than 50 TCK cycles with TMS (SWDIO) =1
2. Send the 16-bit sequence on TMS (SWDIO) = 0111_1001_1110_0111 (MSB transmitted first)
3. Send more than 50 TCK cycles with TMS (SWDIO) =1

NOTE

In case of any reset event, JTAGC is moved to Test Logic Reset (TLR) state first and then JTAGC should be used.

NOTE

If JTAG pins are used for alternative functionality and reset event arrives, then these pins need to be reconfigured to required functionality before using it, in order to avoid unintentional entry in JTAG mode.

83.2 Overview

JTAGC allows you to test chip functionality and connectivity while remaining transparent to system logic when not in test mode. Testing is performed via a boundary scan technique, as defined in the IEEE 1149.1-2001 standard. All data input to and output from JTAGC is communicated in serial format.

83.2.1 Block diagram

The following is a simplified block diagram of the JTAG Controller (JTAGC) block. See the chip-specific configuration information within this chapter as well as Register description for more information about the JTAGC registers.

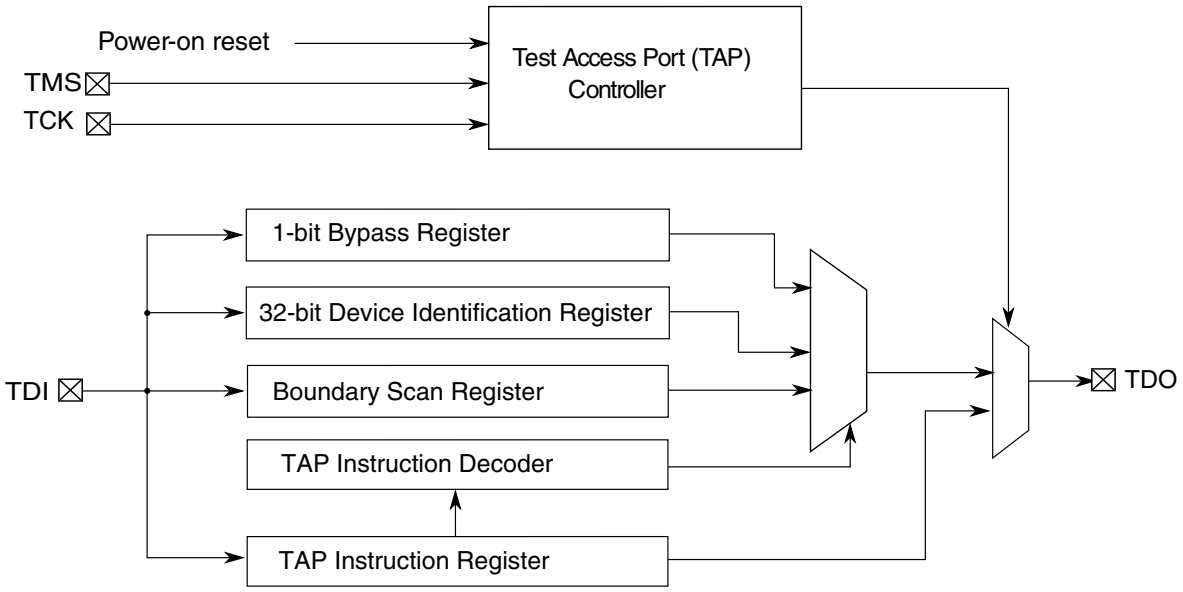

Figure 568. JTAG (IEEE 1149.1) block diagram

83.2.2 Features

The JTAGC block is compliant with the IEEE 1149.1-2001 standard, and supports the following features:

- IEEE 1149.1-2001 TAP interface
  - Four pins (TDI, TMS, TCK, and TDO)
- Instruction register that supports several IEEE 1149.1–2001 defined instructions as well as several public and private device-specific instructions (see JTAGC block instructions for a list of supported instructions).
- Sharing of the TAP with other TAP controllers via ACCESS_AUX_x instructions
- Bypass register, boundary scan register, and device identification register
- TAP controller state machine that controls the operation of the data registers, instruction register, and associated circuitry

83.3 Functional description

83.3.1 Modes of operation

The JTAGC block uses a power-on reset indication as its primary reset signals. Several IEEE 1149.1–2001 defined test modes are supported, as well as a bypass mode.

83.3.1.1 IEEE 1149.1–2001 defined test modes

The JTAGC block supports several IEEE 1149.1–2001 defined test modes. A test mode is selected by loading the appropriate instruction into the instruction register when the JTAGC is enabled. Supported test instructions include EXTEST, HIGHZ, CLAMP, PRELOAD.

Each instruction defines the set of data register(s) that may operate and interact with the on-chip system logic when the instruction is current. Only one test data register path is enabled to shift data between TDI and TDO for each instruction.

The boundary scan register is enabled for serial access between TDI and TDO when the EXTEST, PRELOAD instructions are active. The single-bit bypass register shift stage is enabled for serial access between TDI and TDO when the following instructions are active:

- BYPASS

- HIGHZ
- CLAMP

The functionality of each test mode is explained in more detail in JTAGC block instructions.

83.3.1.2 Bypass mode

When no test operation is required, the BYPASS instruction can be loaded to place the JTAGC block into bypass mode. When in bypass mode, the single-bit bypass shift register is used to provide a minimum-length serial path to shift data between TDI and TDO.

83.3.2 IEEE 1149.1-2001 (JTAG) TAP

The JTAGC block uses the IEEE 1149.1-2001 TAP for accessing registers. This port can be shared with other TAP controllers on the MCU. Ownership of the port is determined by the value of the currently loaded instruction. For more detail on TAP sharing via JTAGC instructions, see ACCESS_AUX_x instructions .

Data is shifted between TDI and TDO through the selected register starting with the least significant bit, as illustrated in the following figure. This applies for the instruction register, test data registers, and the bypass register.

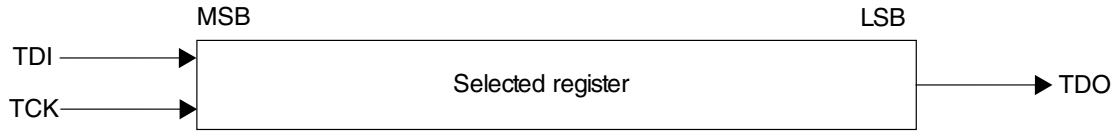

Figure 569. Shifting data through a register

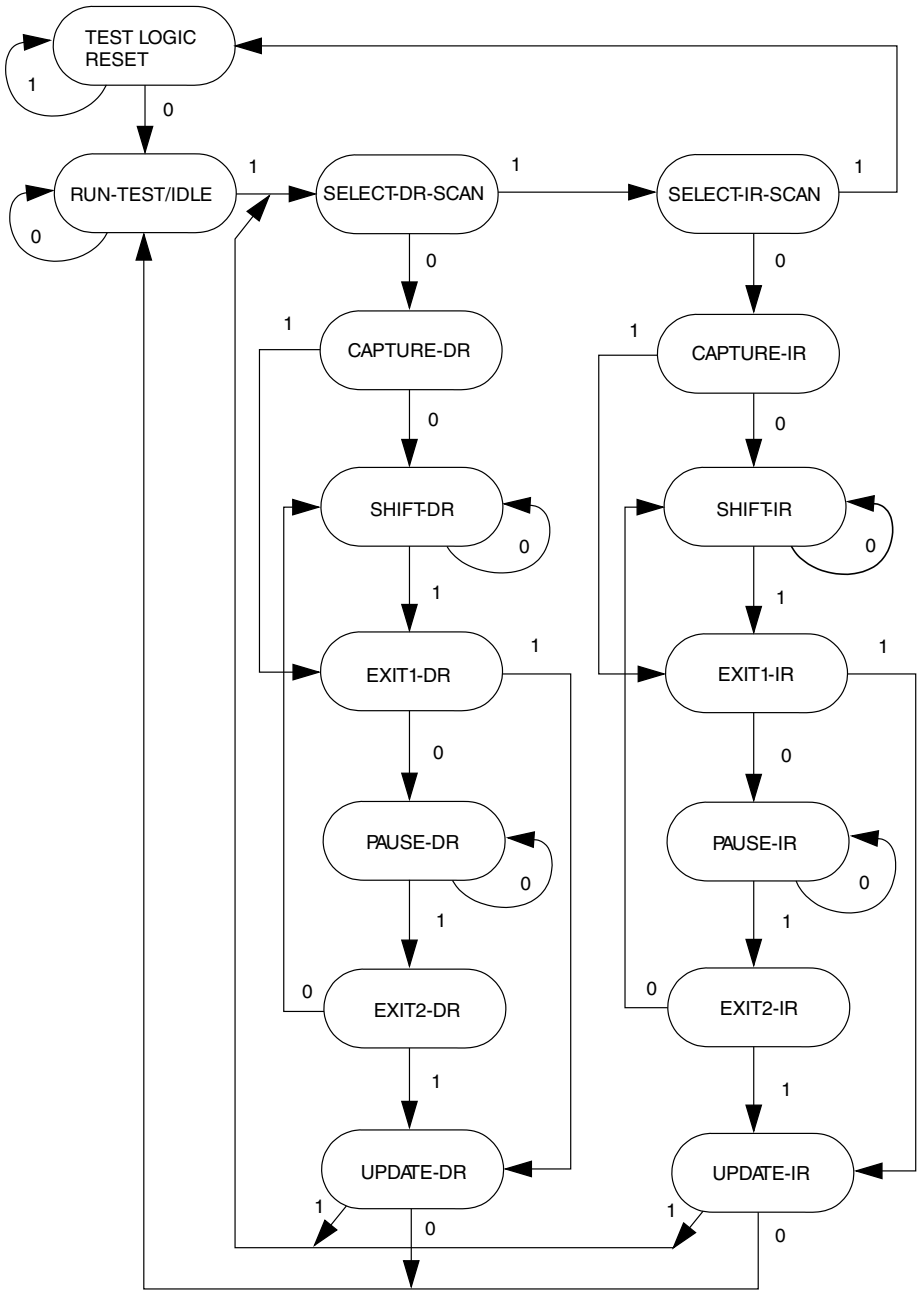
83.3.3 TAP controller state machine

The TAP controller is a synchronous state machine that interprets the sequence of logical values on the TMS pin.

The following figure shows the machine's states. The value shown next to each state is the value of the TMS signal sampled on the rising edge of the TCK signal. As the figure shows, holding TMS at logic 1 when clocking TCK through a sufficient number of rising edges also causes the state machine to enter the Test-Logic-Reset state.



The value shown adjacent to each state transition in this figure represents the value of TMS at the time of a rising edge of TCK.

Figure 570. IEEE 1149.1-2001 TAP controller finite state machine

83.3.3.1 Enabling the TAP controller

The JTAGC TAP controller is enabled by setting the JTAGC enable to a logic 1 value.

83.3.3.2 Selecting an IEEE 1149.1-2001 register

Access to the JTAGC data registers is achieved by loading the instruction register with any of the JTAGC block instructions when the JTAGC is enabled. Instructions are shifted in via the Select-IR-Scan path and loaded in the Update-IR state. At this point, all data register access is performed via the Select-DR-Scan path.

The Select-DR-Scan path is used to read or write the register data by shifting in the data (LSB first) during the Shift-DR state. When reading a register, the register value is loaded into the IEEE 1149.1-2001 shifter during the Capture-DR state. When writing a register, the value is loaded from the IEEE 1149.1-2001 shifter to the register during the Update-DR state. When reading a register, there is no requirement to shift out the entire register contents. Shifting may be terminated after the required number of bits have been acquired.

83.3.4 JTAGC block instructions

The JTAGC implements instructions defined in IEEE 1149.1-2001. See the chip-specific JTAGC information for the JTAGC instructions implemented on this chip. See the IEEE 1149.1-2001 standard for additional information. All undefined opcodes are reserved.

83.3.4.1 IDCODE instruction

IDCODE selects the 32-bit device identification register as the shift path between TDI and TDO. This instruction allows interrogation of the MCU to determine its version number and other part identification data. IDCODE is the instruction placed into the instruction register when the JTAGC block is reset.

83.3.4.2 PRELOAD instruction

The PRELOAD instruction has two functions:

- The PRELOAD portion of the instruction initializes the boundary scan register cells before selecting the EXTEST or CLAMP instructions to perform boundary scan tests. This is achieved by shifting in initialization data to the boundary scan register during the Shift-DR state. The initialization data is transferred to the parallel outputs of the boundary scan register cells on the falling edge of TCK in the Update-DR state. The data is applied to the external output pins by the EXTEST or CLAMP instruction. System operation is not affected.

83.3.4.3 EXTEST external test instruction

EXTEST selects the boundary scan register as the shift path between TDI and TDO. It allows testing of off-chip circuitry and board-level interconnections by driving preloaded data contained in the boundary scan register onto the system output pins. Typically, the preloaded data is loaded into the boundary scan register using the PRELOAD instruction before the selection of EXTEST. EXTEST asserts the internal system reset for the MCU to force a predictable internal state when performing external boundary scan operations.

83.3.4.4 TEST_LEAKAGE instruction

The TEST_LEAKAGE instruction forces the jtag_leakage output signal to high. It is intended to tristate all output pad buffers and disable all of the part's pad input buffers except JCOMP and TEST. The jtag_leakage signal is asserted at the falling edge of TCK following the TAP controller state machine transition from the Update-IR state to the Run-Test-Idle state. When asserted, the part disables TCK, TMS, and TDI inputs and forces them to a logic 1. The TAP controller state machine remains in the Run-Test-Idle state until the JCOMP input is set to a value other than the JTAGC enable encoding. TEST_LEAKAGE also asserts the internal system reset for the MCU to force a predictable internal state.

83.3.4.5 HIGHZ instruction

HIGHZ selects the bypass register as the shift path between TDI and TDO. When HIGHZ is active all output drivers are placed in an inactive drive state (for example, high impedance). HIGHZ also asserts the internal system reset for the MCU to force a predictable internal state.

83.3.4.6 CLAMP instruction

CLAMP allows the state of signals driven from MCU pins to be determined from the boundary scan register when the bypass register is selected as the serial path between TDI and TDO. CLAMP enhances test efficiency by reducing the overall shift path to a single bit (the bypass register) when conducting an EXTEST type of instruction through the boundary scan register. CLAMP also asserts the internal system reset for the MCU to force a predictable internal state.

83.3.4.7 ACCESS_AUX_x instructions

The JTAGC is configurable to allow other TAP controllers on the device to share the port with it. This is done by providing ACCESS_AUX_x instructions for each of these TAP controllers.

When this instruction is loaded, control of the JTAG pins is transferred to the selected TAP controller. Any data input via TDI and TMS is passed to the selected TAP controller, and any TDO output from the selected TAP controller is sent back to the JTAGC to be output on the pins.

The JTAGC regains control of the JTAG port during the UPDATE-DR state if the PAUSE-DR state was entered. Auxiliary TAP controllers are held in RUN-TEST/IDLE when they are inactive. Instructions not used to access an auxiliary TAP controller on a device are treated like the BYPASS instruction.

83.3.4.8 BYPASS instruction

BYPASS selects the bypass register, creating a single-bit shift register path between TDI and TDO. BYPASS enhances test efficiency by reducing the overall shift path when no test operation of the MCU is required. This allows more rapid movement of test data to and from other components on a board that are required to perform test functions. When the BYPASS instruction is active the system logic operates normally.

83.3.5 Boundary scan

The boundary scan technique allows signals at component boundaries to be controlled and observed through the shift-register stage associated with each pad. Each stage is part of a larger boundary scan register cell, and cells for each pad are interconnected serially to form a shift-register chain around the border of the design. The boundary scan register consists of this shift-register chain, and is connected between TDI and TDO when the EXTEST, PRELOAD instructions are loaded. The shift-register chain contains a serial input and serial output, as well as clock and control signals.

83.3.6 Clocking

There is one clock for this module. For more information See External signals.

83.3.7 Interrupts

This module has no interrupts.

83.3.8 Reset

The JTAGC block is placed in reset when:

- Power-on reset is asserted
- TMS input is held high for enough consecutive rising edges of TCK to sequence the TAP controller state machine into the Test-Logic-Reset state

Holding TMS high for five consecutive rising edges of TCK guarantees entry into the Test-Logic-Reset state regardless of the current TAP controller state. Asserting power-on reset results in asynchronous entry into the reset state.

When in reset, the following actions occur:

- The TAP controller is forced into the Test-Logic-Reset state, thereby disabling the test logic and allowing normal operation of the on-chip system logic to continue unhindered.
- The instruction register is loaded with the IDCODE instruction.

83.3.8.1 JTAGC reset configuration

When in reset, the TAP controller is forced into the Test-Logic-Reset state, thus disabling the test logic and allowing normal operation of the on-chip system logic. In addition, the instruction register is loaded with the IDCODE instruction.

83.4 External signals

JTAGC includes a set of signals that connect to off-chip development tools and allow access to test support functions. The JTAGC signals are outlined in the following table and described in the following sections.

Table 838. JTAG signal properties

Name	I/O	Function	Reset state
TCK	Input	Test clock	Weak pulldown
TDI	Input	Test data in	Weak pullup
TDO	Output	Test data out	High Z[1]
TMS	Input	Test mode select	Weak pullup

1. TDO output buffer enable is negated when the JTAGC is not in the Shift-IR or Shift-DR states. A weak pull may be implemented at the TDO pad for use when JTAGC is inactive.

83.4.1 Test clock input (TCK)

Test Clock Input (TCK) is an input pin used to synchronize the test logic and control register access through the TAP.

83.4.2 Test data input (TDI)

Test Data Input (TDI) is an input pin that receives serial test instructions and data. TDI is sampled on the rising edge of TCK.

83.4.3 Test data output (TDO)

Test Data Output (TDO) is an output pin that transmits serial output for test instructions and data. TDO is tristateable and is actively driven only in the Shift-IR and Shift-DR states of the TAP controller state machine, which is described in TAP controller state machine.

83.4.4 Test mode select (TMS)

Test Mode Select (TMS) is an input pin used to sequence the IEEE 1149.1-2001 test control state machine. TMS is sampled on the rising edge of TCK.

83.5 Initialization

To initialize the JTAGC block and enable access to registers, the following sequence is required:

1. Place the JTAGC in reset through TAP controller state machine transitions controlled by TMS.
2. Load the appropriate instruction for the test or action to be performed.

83.6 Application information

The test logic is a static logic design, and TCK can be stopped in either a high or low state without loss of data. However, the system clock is not synchronized to TCK internally. Any mixed operation using both the test logic and the system functional logic requires external synchronization.

83.7 Register description

This section provides a detailed description of the JTAGC block registers accessible through the TAP interface, including data registers and the instruction register. Individual bit-level descriptions and reset states of each register are included. These registers are not memory-mapped and can only be accessed through the TAP.

83.7.1 Instruction register

The JTAGC block uses a 8-bit instruction register as shown in the following figure.

The instruction register allows instructions to be loaded into the block to select the test to be performed, or the test data register to be accessed, or both. Instructions are shifted in through TDI when the TAP controller is in the Shift-IR state, and latched on the falling edge of TCK in the Update-IR state. The latched instruction value can only be changed in the Update-IR and Test-Logic-Reset TAP controller states.

Synchronous entry into the Test-Logic-Reset state results in the IDCODE instruction being loaded on the falling edge of TCK. Asynchronous entry into the Test-Logic-Reset state results in asynchronous loading of the IDCODE instruction. During the Capture-IR TAP controller state, the instruction shift register is loaded with the value 0b1, making this value the register's read value when the TAP controller is sequenced into the Shift-IR state.

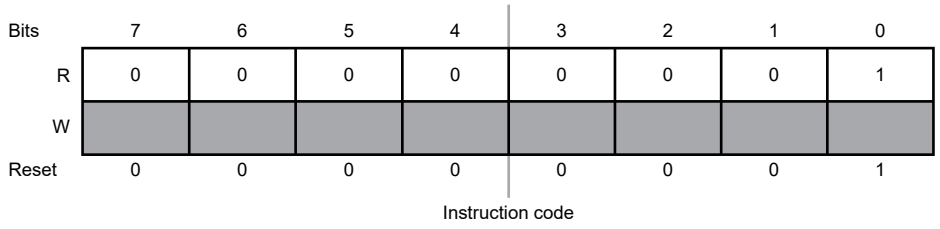


Figure 571. Instruction register

83.7.2 Bypass register

The bypass register is a single-bit shift register path selected for serial data transfer between TDI and TDO when the following instructions are active:

- BYPASS
- HIGHZ
- CLAMP

After entry into the Capture-DR state, the single-bit shift register is set to a logic 0. Therefore, the first bit shifted out after selecting the bypass register is always a logic 0.

83.7.3 Device identification register

The device identification (JTAG ID) register, shown in the following figure, allows the revision number, part number, manufacturer, and design center responsible for the design of the part to be determined through the TAP.

The device identification register is selected for serial data transfer between TDI and TDO when the IDCODE instruction is active. Entry into the Capture-DR state when the device identification register is selected loads the IDCODE into the shift register to be shifted out on TDO in the Shift-DR state. No action occurs in the Update-DR state.

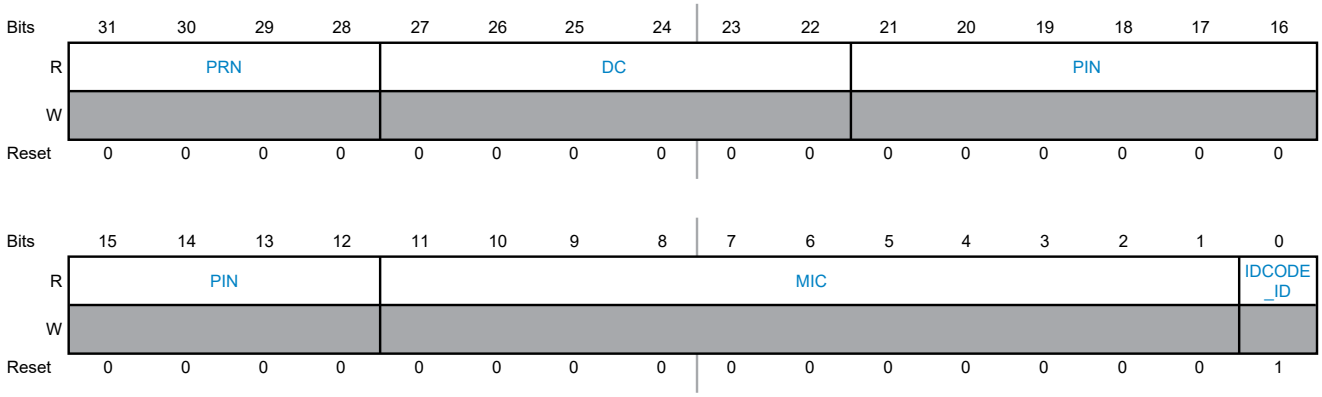

Figure 572. Device identification register

The following table describes the device identification register functions. The device identification register values are described in the chip-specific JTAGC information.

Table 839. Device identification register field descriptions

Field	Function
PRN	Part revision number Contains the revision number of the part.
DC	Design center Indicates the design center.
PIN	Part identification number Contains the part number of the device.
MIC	Manufacturer identity code Contains the reduced Joint Electron Device Engineering Council (JEDEC) ID .
IDCODE ID	IDCODE register ID Identifies this register as the device identification register and not the bypass register. Always set to 1.

83.7.4 Boundary scan register

The boundary scan register is connected between TDI and TDO when the EXTEST, PRELOAD instructions are active. It is used to:

- Capture input pin data
- Force fixed values on output pins
- Select a logic value and direction for bidirectional pins

Each bit of the boundary scan register represents a separate boundary scan register cell, as described in the IEEE 1149.1-2001 standard and discussed in Boundary scan. The size of the boundary scan register and bit ordering is device-dependent and can be found in the device BSDL file.

Chapter 84
JTAG Data Communication (JDC)

84.1 Overview

JDC module provides the capability to move register data between the IPS and JTAG domains. This facilitates communication between internal resources that access memory-mapped register space and an external tool that accesses the JTAG port.

The JDC module consists of:

- IPS-accessible registers
- JTAG-accessible registers
- Associated logic to coordinate movement of data from one register domain to another

The JDC implements the following IPS data registers, occupying separate memory space:

- 1 32-bit memory mapped register that can be read or written via IPS (JTAG Output Data Register (JOUT_IPS)), and whose contents are ported out for capture into a JTAG register (JOUT) to be read via the JTAG port.
- 1 32-bit memory mapped register that can only be read via IPS (JTAG Input Data Register (JIN_IPS)), and whose contents are loaded from a JTAG register (JIN).

JDC indicates when:

- New data has been shifted in via the JTAG port and is ready to be read from the JTAG Input Data Register (JIN_IPS) register
- New data has been written to the JTAG Output Data Register (JOUT_IPS) register and is ready to be read via the JTAG port

A Module Status Register (MSR) captures the state of these flags and also provides the flags to a JTAG register (JOUT) for tool visibility.

84.1.1 Block diagram

There is a single bus interface to port register data out to the JTAGC, and a single bus interface to port data in from the JTAGC. The following figure is the JDC module block diagram.

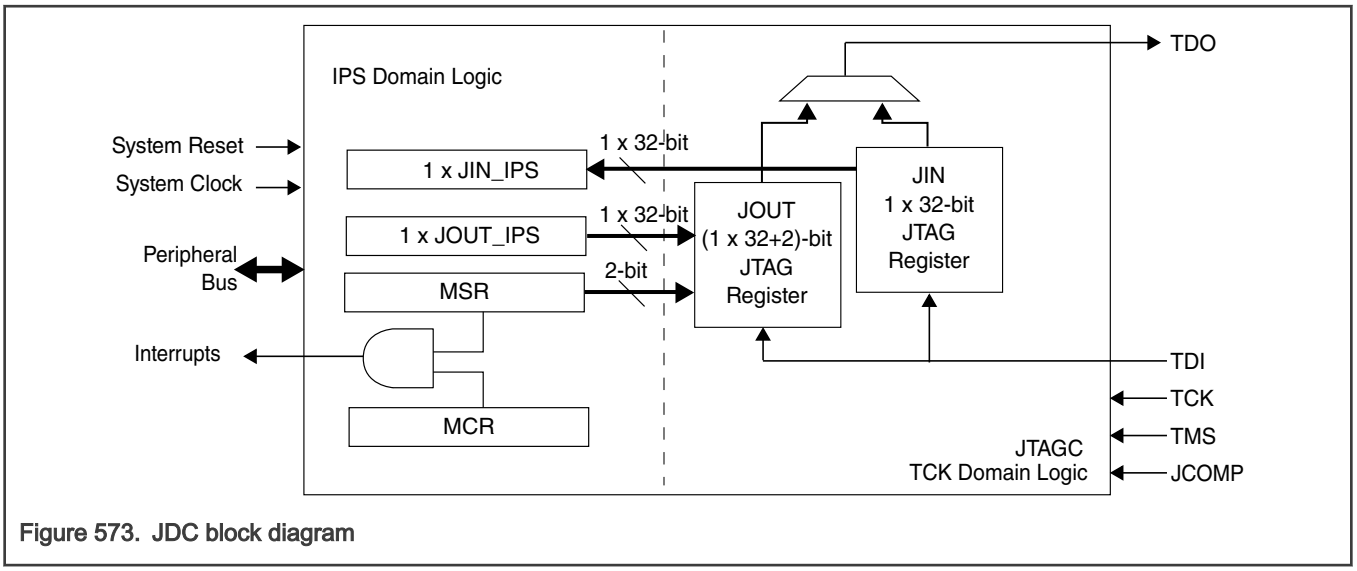

Figure 573. JDC block diagram

84.2 Functional description

The JDC module provides the ability to shift in data via the JTAG port and capture that data in memory-mapped register that can be accessed via IPS. It also provides the ability to capture data written to memory-mapped register into a JTAG shift register for output via the JTAG port.

84.2.1 JDC functionality

An overview of the module functionality is described here:

- Software write to the JOUT_IPS register:
  1. The JDC sets the JOUT_RDY flag bit, indicating new data is available to be read from the JOUT register via the JTAG port.
  2. The MSR reflects the state of the JOUT_RDY bit.
  3. The JDC also captures the state of the JOUT_RDY bit in the JOUT register.
  4. A JTAG read of the JOUT register via execution of the JOUT_READ instruction with a JOUT_RDY bit whose value is logic 1 indicates that the register contains new data.
  5. The JDC clears the JOUT_RDY flag bit upon exit of the Capture-DR JTAG state during execution of the JOUT_READ instruction.
  6. Clearing the JOUT_RDY bit indicates to software that a new data value can be written to the JOUT_IPS register.
- JTAG write to the JIN register via execution of the JIN_WRITE JTAG instruction:
  1. The JDC updates the contents of the JIN_IPS register upon exit of the Update-DR state.
  2. An update of the JIN_IPS register sets the JIN_RDY flag bit, indicating new data is available to be read via IPS.
  3. The MSR register reflects the state of the JIN_RDY bit.
  4. The JDC also captures the state of the JIN_RDY bit in the JOUT register.
  5. The JDC clears the JIN_RDY flag bit upon software read of the JIN_IPS register.
  6. A JTAG read of the JOUT register with a JIN_RDY value of logic 0 indicates that new data can be written to the JIN register.

84.2.2 JTAG register access

See the JTAGC documentation for information on how to access the JTAG registers.

84.2.2.1 JDC block instructions

The JDC block implements the instructions listed in Table 840. This section gives an overview of each instruction. All undefined opcodes are reserved.

Table 840. JTAG instructions

Instruction	Code[4:0]	Instruction summary
Reserved	00001	Factory debug reserved.
JOUT_READ	00010	Selects JOUT data register. The JDC captures data from JOUT_IPS into JOUT data register upon entry to Capture-DR state when JOUT_READ is active.
JIN_WRITE	01110	Selects JIN data register. The JDC captures data from JIN into JIN_IPS upon exit of Update-DR state when JIN_WRITE is active.

Table continues on the next page...

Table 840. JTAG instructions (continued)

Instruction	Code[4:0]	Instruction summary
BYPASS[1]	11111	Selects bypass register for data operations.
Reserved	All other opcodes	Decoded to select bypass register.

1. This is an IEEE 1149.1-2001 defined instruction. See the IEEE 1149.1-2001 standard for more details.

84.2.3 Clocking

JDC module uses TCK and inverted TCK as clock source.

84.2.4 Interrupts

This module has no interrupts.

84.3 External signals

JDC signals are listed in the following table.

Table 841. Signal properties

Name	Function	I/O	Reset
TCK	Test clock input	I	—
TMS	Test mode select	I	0
TDI	Test data in	I	0
JCOMP	JTAG compliance pin	I	0
TDO	Test data out	O	HiZ

84.4 Initialization

This module does not require initialization.

84.5 Secure challenge/response connection procedure

A summary of how the JDC can be used to interact with a security module to perform challenge/response password authorization is as follows:

1. After exit of reset, all registers are at their reset values. JIN_RDY bit value of 0 indicates that the tool may write data to the JIN register. JOUT_RDY bit value of 0 indicates that software may write data to the JOUT_IPS register.
2. The MCR register is programmed to enable JOUT and JIN interrupts, or not.
3. Once the tool is ready to start the authorization process, it writes a value to the JIN register via execution of the JTAGC JIN_WRITE instruction.
4. Software monitors the state of the JIN_RDY bit or enables the JIN interrupt and uses the interrupt assertion as a trigger to start the authorization process.
5. Once the authorization process is started, software writes the first JOUT value to the JOUT_IPS register. This sets the JOUT_RDY bit value to 1.

6. Following the initial tool write to the JIN register, the tool polls the JOUT register to determine when software has provided a challenge word. Upon reading the JOUT register with JOUT_RDY bit set, the tool records the data value to be used to generate the appropriate response. The read of the JOUT register clears the JOUT_RDY bit. The clearing of the JOUT_RDY bit also sets the JOUT_INT bit and asserts the JOUT interrupt if the MCR[JOUT_IEN] is set.
7. With the JOUT_RDY bit cleared, software may now provide the next challenge word.
8. Once the tool has generated a response word, it uses the value of the JIN_RDY bit from the JOUT register read to determine when it can perform a write to the JIN register to provide the response.
9. The security module can provide additional challenge words and read back the corresponding response words as needed, repeating the process.

Simply providing a password without using the challenge/response protocol can be done in a similar way. The tool provides 32-bits of the password at a time with each write to the JIN register, and monitors the JIN_RDY bit value of the JOUT register to determine when the next JIN register value can be written. There is no need for software to write the JOUT_IPS register in this case.

For details related to the lifecycle stage at which this process is performed, see the "Hardware Security Engine" chapter.

84.6 JDC register descriptions

The following sections describe the implemented 32-bit registers. Only 32-bit accesses are valid. The effects of access that are not 32 bits are not defined.

84.6.1 JDC memory map

JDC base address: 4039_4000h

Offset	Register	Width (In bits)	Access	Reset value
0h	Module Configuration Register (MCR)	32	RW	0000_0000h
4h	Module Status Register (MSR)	32	RW	0000_0000h
8h	JTAG Output Data Register (JOUT_IPS)	32	RW	0000_0000h
Ch	JTAG Input Data Register (JIN_IPS)	32	R	0000_0000h

84.6.2 Module Configuration Register (MCR)

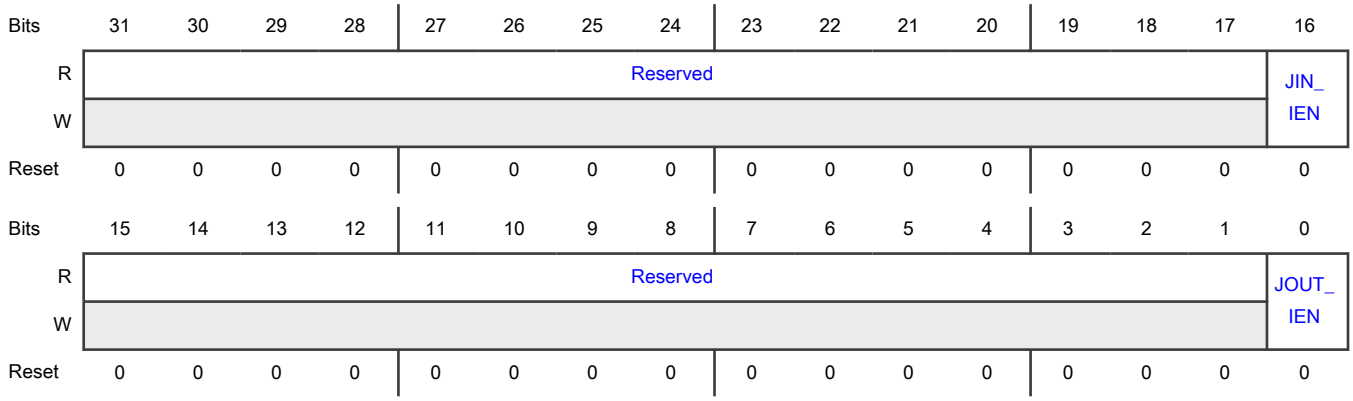
Offset

Register	Offset
MCR	0h

Function

The MCR enables the interrupt outputs of the JDC. This register is reset by system destructive reset.

Diagram



Fields

Field	Function
31-17 —	Reserved
16 JIN_IEN	JIN Interrupt Enable 0b - Setting MSR[JIN_INT] bit does not assert the JIN interrupt 1b - Setting MSR[JIN_INT] bit asserts the JIN interrupt
15-1 —	Reserved
0 JOUT_IEN	JOUT Interrupt Enable 0b - Setting MSR[JOUT_INT] bit does not assert the JOUT interrupt 1b - Setting MSR[JOUT_INT] bit asserts the JOUT interrupt

84.6.3 Module Status Register (MSR)

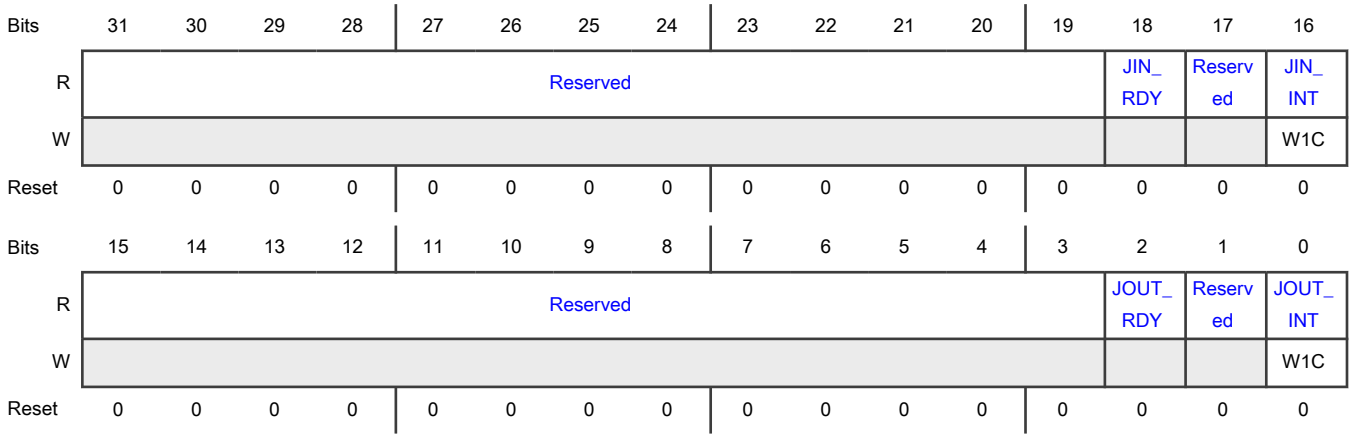
Offset

Register	Offset
MSR	4h

Function

The MSR holds the JTAG register status and interrupt bits. This register is reset by system destructive reset.

Diagram



Fields

Field	Function
31-19 —	Reserved
18 JIN_RDY	JIN Ready (read only) 0b - Cleared upon software read of JIN_IPS contents via IPS 1b - Set when new data is written to the JIN_IPS register
17 —	Reserved
16 JIN_INT	JIN Interrupt 0b - Cleared by writing logic 1 1b - Set when new data is written to the JIN_IPS register
15-3 —	Reserved
2 JOUT_RDY	JOUT Ready (read only) 0b - Cleared upon tool read of JOUT register via JTAG port 1b - Set when new data is written to the JOUT_IPS register
1 —	Reserved
0 JOUT_INT	JOUT Interrupt 0b - Cleared by writing logic 1 1b - Set when JOUT_RDY bit is cleared by tool reading JOUT register

84.6.4 JTAG Output Data Register (JOUT_IPS)

Offset

Register	Offset
JOUT_IPS	8h

Function

The JOUT_IPS register holds data written via IPS. The JDC captures the JOUT_IPS contents into the JOUT register to be read via the JTAG port. This register is reset by system destructive reset.

Diagram

84.7 Non-memory-mapped register definition

The JDC also implements two JTAG accessible registers that are not memory-mapped. One JTAG register shifts in data to be placed in the JIN_IPS register. The other JTAG register captures data from the JOUT_IPS register plus ready status from the MSR, to be shifted out via the JTAG port.

84.7.1 JTAG output data register (JOUT)

The JOUT register captures data from the JOUT_IPS register upon execution of the JOUT_READ JTAG instruction. It also holds the JIN_RDY and JOUT_RDY status bits. This register is reset by system destructive reset and JTAG reset. The reset value of the JOUT register is 0. The following figure shows the format of the JOUT register.

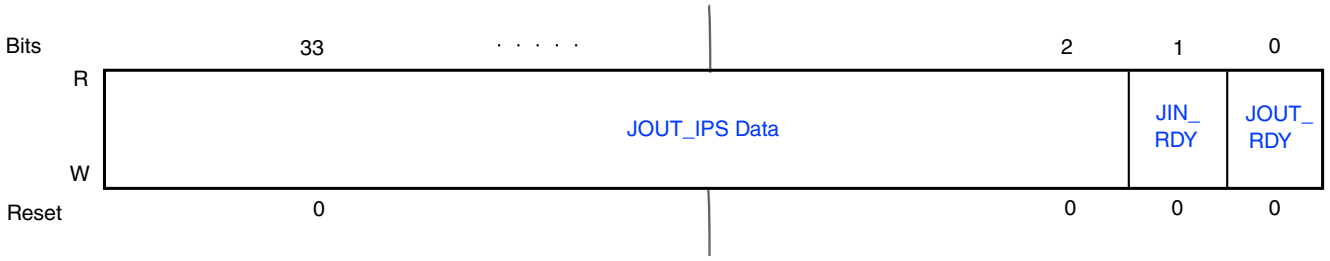

Figure 574. JOUT

The JOUT register is described in the following table.

Table 842. JOUT JTAG register field descriptions

Field	Function
JOUT_IPS Data	JOUT_IPS Data Data value from JOUT_IPS register

Table continues on the next page...

Field	Function
JIN_RDY	JIN_RDY State of JIN_RDY bit from MSR
JOUT_RDY	JOUT_RDY State of JOUT_RDY bit from MSR

84.7.2 JTAG input data register (JIN)

The external tool writes data to the JIN register via JTAG during execution of the JIN_WRITE JTAG instruction. The JDC later captures JIN data in the JIN_IPS register to be read via IPS. This register is reset by system destructive reset and JTAG reset. The reset value of the JIN register is 0. The following figure shows the format of the JIN register.

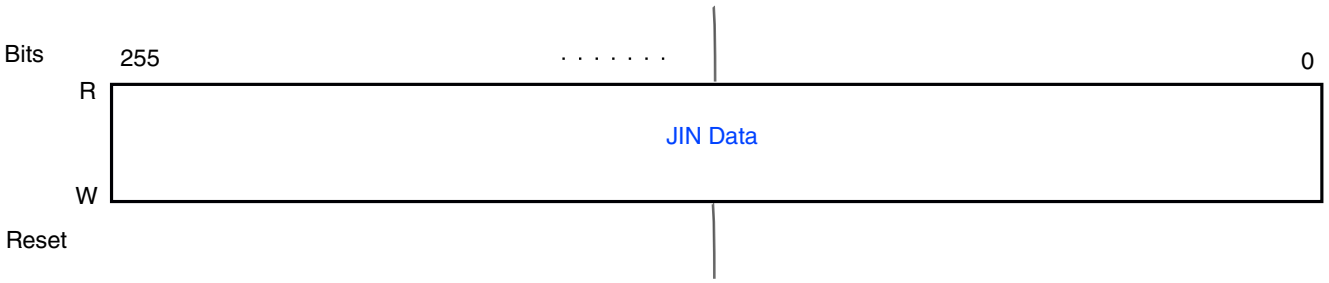

Figure 575. JIN

The JIN register is described in the following table.

Table 843. JIN JTAG register field descriptions

Field	Description
JIN Data	Contains data to be captured in JIN_IPS register upon exit of Update-DR state when executing WRITE_JIN JTAG instruction.

XBAR	Crossbar bus interface

Chapter 85
Temperature Sensor (TempSense)

85.1 Overview

TEMPSENSE is used to measure the temperature on the chip through an ADC and to flag if an overtemperature condition occurs.

The TEMPSENSE module contains control registers for use with the Engineering temperature sensor (ETS) hard block and the flag generation hard block. These registers use a peripheral bus interface to communicate with the chip.

85.1.1 Block diagram

The functional structure of the TEMPSENSE can be seen in the block diagram in Figure 576.

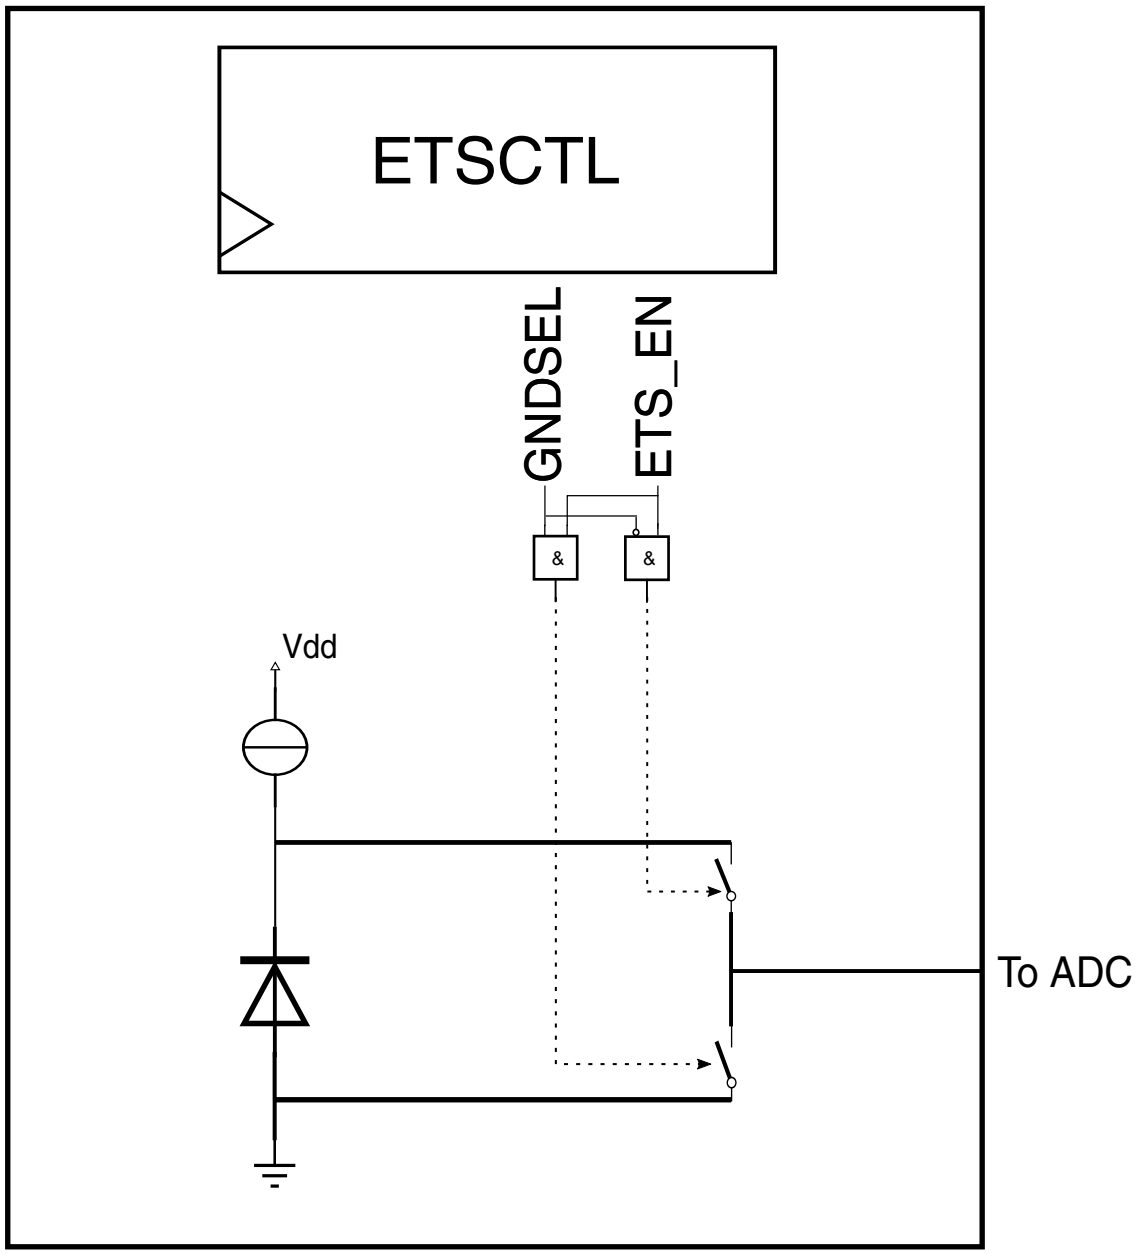

Figure 576. TEMPSENSE block diagram

85.1.2 Features

The TEMPSENSE includes the following features:

- Provide a voltage proportional to the temperature which will be read out by ADC
- Ground selection for improved precision in the ETS. The ETS ground could be different from the ADC ground. By exposing it to the ADC, the temperature calculation could be improved as the voltage value will be more precise.
- Interrupt generation.
- Selftest of the flags

85.2 Functional description

85.2.1 Clocking

This module has no clocking considerations.

85.2.2 Interrupts

This module has no interrupts.

85.2.3 General

The TEMPSENSE module is designed to measure the temperature on the chip. The TEMPSENSE output can be read by an ADC on demand so that the software can determine the current die temperature. The software should enable the TEMPSENSE by setting ETSCTL[ETS_EN].

Coefficients are used to allow a simple and accurate calculation of linearized temperature directly from the ADC. The increase of the sampling time of the ADC from the minimum sampling value is increasing the temperature accuracy.

85.2.4 Initialization

85.2.4.1 Conversion from voltage to temperature

Solve the equation for the conversion from voltage to temperature, where V_{ETS} is the difference of V_{be} and V_{GND}. V_{GND} is expose on the ADC output when ETSCTL[GNDSEL] is set.

$$T_{ETS} = TCA_0 + TCA_1 \cdot V_{ETS} + TCA_2 \cdot V_{ETS}^2$$

The coefficients TCA0, TCA1 and TCA2 are read from the corresponding registers. They are stored in a signed fixed-point format as the following TCAx(11,4) (1 bit for the sign, 11 bits for the integer part and 4 bits for the decimal part).

The calculation of the temperature should be done with the actual coefficient values provided in the TCAx fields. See the example below for an ambient temperature of 25C, and an ADC reference voltage (V_{REFH}) of 5V. See the ADC section of the device data sheet for more details on V_{REFH} and N-bit level resolution.

$$TCA0 = (000110100100.1110)_2 = (000110100100)_2 + (1110)_2 \times \frac{1}{2^4} = +((420)_{10} + (14)_{10} \times \frac{1}{2^4}) = +420.8750\ C$$

$$TCA1 = (100010101111.1110)_2 = (100010101111)_2 + (1110)_2 \times \frac{1}{2^4} = -((175)_{10} + (14)_{10} \times \frac{1}{2^4}) = -175.8750\ C/V$$

$$TCA2 = (100000011101.1110)_2 = (100000011101)_2 + (1110)_2 \times \frac{1}{2^4} = -((29)_{10} + (14)_{10} \times \frac{1}{2^4}) = -29.8750\ C\ /V^2$$

$$V_{ETS} = (010110001011)_2 = (1419)_{10} \times \frac{V_{REFH}}{2^N}$$

By using the formula, the junction temperature calculated is 26.5838 C.

The maximal calculation error is 0.0313 C.

85.3 External signals

There are no external signals for this module.

85.4 Memory map and register definition

85.4.1 Transfer error description

The following actions will cause a transfer error and will not change the register content:

- Any access to an unused register address
- Write access to a read-only register (TCAx)

85.4.2 TempSense register descriptions

85.4.2.1 TempSense memory map

Appendix A
General Changes

A.1 General changes

Added S32K389 information. Added new chapter "Quad Serial Peripheral Interface (QuadSPI) for S32K322, S32K342, S32K341, S32K314, S32K324, and S32K344".

Appendix B
Release notes

B.1 About This Manual changes

No substantial content changes.

B.2 Introduction changes

- Added S32K389 related information.
- In Figure 11 removed D-Flash from PFC1 controller.

B.3 Memory map module changes

- In Considerations related to TCM's implementation added statement "ITCM initialization via backdoor can be done by using STM (Store Multiple) with even number of registers. STRD (Store Dual) instruction would not work".

B.4 Signal Multiplexing module changes

No substantial content changes.

B.5 Cortex-M7 changes

- Added statement "and by ensuring that corresponding faults are not being processed before the appropriate management is in place" in Speculative accesses .

B.6 Miscellaneous Control Module (MCM)

B.6.1 Chip-specific MCM information changes

No substantial content changes.

B.6.2 MCM module changes

- Added Processor Identifier (PID).
- Added more restrictions to note in Memory map and register descriptions.

B.7 Miscellaneous System Control Module (MSCM)

B.7.1 Chip-specific MSCM information changes

No substantial content changes.

B.7.2 MSCM module changes

No substantial content changes.

B.8 Virtualization Wrapper (VIRT_WRAPPER) for S32K388 and S32K389

B.8.1 Chip-specific VIRT WRAPPER for S32K388 information changes

No substantial content changes.

B.8.2 VIRT_WRAPPER changes

- In Virtualization of interrupt control registers, added "The PDAC that...16 KB space" and "Access to mirrored...region".
- In Modes of operation, added see "Chip specific... for more details".

B.9 Chip-specific VIRT WRAPPER information changes

No substantial content changes.

B.10 System Integration Unit Lite2 (SIUL2)

B.10.1 Chip-specific SIUL2 information changes

- Added note "When a pad is used with IBE=1, the PAD must be actively driven. Otherwise, IO states are not deterministic" in Feature availability.

B.10.2 SIUL2 module changes

- Updated the Block diagram.

B.11 Touch Sensing Pin Coupling (TSPC)

B.11.1 Chip-specific TSPC information changes

No substantial content changes.

B.11.2 TSPC module changes

No substantial content changes.

B.12 Crossbar Switch (AXBS)

B.12.1 Chip-specific AXBS information changes

No substantial content changes.

B.12.2 AXBS module changes

No substantial content changes.

B.13 Peripheral Bridge (AIPS_Lite)

B.13.1 Chip-specific AIPS_Lite information changes

No substantial content changes.

B.13.2 AIPS_Lite module changes

No substantial content changes.

B.14 Direct Memory Access Multiplexer (DMAMUX)

B.14.1 Chip-specific DMAMUX information changes

No substantial content changes.

B.14.2 DMAMUX module changes

No substantial content changes.

B.15 Enhanced Direct Memory Access (eDMA)

B.15.1 Chip-specific eDMA information changes

No substantial content changes.

B.15.2 eDMA3 module changes

No substantial content changes.

B.16 INTM module changes

- For INTM_TIMER0-INTM_TIMER3 registers, updated access of TIMER bit field to Read Write

B.17 Semaphores2 (SEMA42)

B.17.1 Chip-specific SEMA42 information changes

No substantial content changes.

B.17.2 SEMA42 module changes

- Moved the "Initialization" and "External signals" section above "Memory map/register defination" section.

B.18 Crossbar Integrity Checker (XBIC)

B.18.1 Chip-specific XBIC information changes

- Added note in Table 64.

B.18.2 XBIC module changes

- Updated the "Features".

B.19 Extended Resource Domain Controller (XRDC)

B.19.1 Chip-specific XRDC information changes

- Revised Table 70, XRDC_MRC1 to remove "TCM backdoor (1)" and replace "PRAM1_0 (2)" with "PRAM1_0 (1)".

B.19.2 XRDC module changes

- Added Exceptions and violations.

B.20 Memories and Memory Interfaces changes

No substantial content changes.

B.21 Embedded Flash Memory (c40asf)

B.21.1 Chip-specific C40asf information changes

- In Flash memory configuration and register settings updated Start address for Code flash memory 1 (changed from 0050_000 to 0050_0000) and added note "Flash cannot be accessed during RWSC programming".
- In Flash memory configuration and register settings added note "User-accessible Code and Data flash spaces have been all erased at the NXP factory.".

B.21.2 Embedded Flash Memory (c40asf)

No substantial content changes.

B.22 Flash Memory Controller (PFLASH)

B.22.1 Chip-specific PFLASH information changes

No substantial content changes.

B.22.2 PFLASH controller module changes

No substantial content changes.

B.23 RAM Controller (PRAMC)

B.23.1 Chip-specific PRAMC information changes

No substantial content changes.

B.23.2 PRAMC module changes

No substantial content changes.

B.24 Clocking module changes

- Added note in GMAC clocking.
- In Table 145 updated the max freqency for AIPS_PLAT_CLK to 80 MHz and AIPS_SLOW_CLK to 40 MHz.
- In Table 149 updated PLL_AUX_PHI0_CLK/PLLODIV_0[DIV] configure value from 0011b, to 0001b, in PLL_AUX_PHI2_CLK added PLLODIV_2[DIV] with configure value 0100b, and updated PLL_PHI1_CLK-related clocks (added QSPI_SFCK).
- Added note "The value of CGM divider depends on mode of working. For example, if 25 MHz mode is selected, then the divider value is 2, if 2.5 MHz mode is selected then the divider value is 20." in EMAC MII clocking and EMAC RMII clocking.
- Updated Case3 in FIRC failure detection
- Updated Figure 105.
- In Figure 119 updated CMU_FCO.
- In Table 111 updated the minimum and maximum frequency for PLL_Phin_CLK.

B.25 Clock Generation Module (MC_CGM)

B.25.1 Chip-specific MC_CGM information changes

- Added Clock Mux 7 select control register MUX_7_CSC[SELCTL] description (S32K328, S32K338, S32K348, and S32K358) and Clock Mux 7 select control register MUX_7_CSC[SELCTL] description (S32K344, S32K324, S32K314, S32K322, S32K341 and S32K342).
- Added note "Clock sources listed in the MUX_n_CSC[SELCTL] bit field are defined based on S32K388 and S32K389. For other variants, see the clock system diagrams in section “Clocking overview” in the “Clocking ” chapter." in Associated content references.

B.25.2 MC_CGM module changes

No substantial content changes.

B.26 FIRC module changes

No substantial content changes.

B.27 SIRC module changes

No substantial content changes.

B.28 Fast Crystal Oscillator Digital Controller (FXOSC)

B.28.1 Chip-specific FXOSC information changes

No substantial content changes.

B.28.2 FXOSC module changes

- Added long description to CTRL[ALC_D].
- In Initialization- Added a note "See Hardware design guide for further details and the recommended circuit for each mode."

B.29 SXOSC module changes

No substantial content changes.

B.30 PLL Digital Interface (PLLDIG)

B.30.1 Chip-specific PLLDIG information changes

No substantial content changes.

B.30.2 PLLDIG module changes

No substantial content changes.

B.31 Reset module changes

- Added S32K341 in footnote 6 of Table 185

B.32 Boot Overview changes

- In Image vector table removed statement "SBAF uses this field only when the HSE firmware usage feature flag is enabled and BOOT_SEQ field is 0" from offset 0c/14/1c.

B.33 Reset Generation Module (MC_RGM)

B.33.1 Chip-specific MC_RGM information changes

No substantial content changes.

B.33.2 MC_RGM module changes

• Updated the note in Functional /External Reset Status Register (FES). • In External signal description, updated the reset value of "RESET_B" signal.
• Updated the note in Functional /External Reset Status Register (FES). • Updated Figure 154 and Figure 155. • Removed "(except for a small portion, for example FIRC, JTAG interface)" from Reset sources. • Updated references to reset chapter to make them generic.
• Updated the note in DES[F_POR]. • Updated the note in Functional /External Reset Status Register (FES).

B.34 POR_WDG module changes

No substantial content changes.

B.35 Security overview changes

No substantial content changes.

B.36 HSE Subsystem Overview changes

• Added statement "The Secure area sizes are enforced by the Memory controllers and updated to appropriate value by HSE before any Host core release. This ensures that these secure areas are never exposed to any other core than HSE." in Secure RAM.

B.37 DCF module changes

• Updated initial programming sequence in Figure 159.

B.38 DCM_GPR module changes

• Added applicability for S32K310 in DCM controlled features and availability in product family. • Revised "DCM_GPR register descriptions".
• Revised "DCM_GPR register descriptions".
• Deleted DCMRWF2[SIRC_TRIM_BYP_STDBY_EXT].
• Revised DCM controlled features and availability in product family to include S32K389 registers.
• Added DCMROD9[PF1_0_CODE_ECC_ERR], DCMROD9[PF1_0_DATA_ECC_ERR], DCMROD9[PF1_1_CODE_ECC_ERR], DCMROD9[PF1_1_DATA_ECC_ERR], DCMROD9[FLASH1_EDC_ERR], DCMROD9[FLASH1_ADDR_ENC_ERR], DCMROD9[FLASH1_REF_ERR], DCMROD9[FLASH1_RST_ERR],

Table continues on the next page...

DCMROD9[FLASH1_ECC_ERR], DCMROD9[PRAM3_ECC_ERR], DCMROD9[PRAM3_FCCU_ALARM], DCMRWD17[PF1_0_CODE_ECC_ERR_EN], DCMRWD17[PF1_0_DATA_ECC_ERR_EN], DCMRWD17[PF1_1_CODE_ECC_ERR_EN], DCMRWD17[PF1_1_DATA_ECC_ERR_EN], DCMRWD17[FLASH1_EDC_ERR_EN], DCMRWD17[FLASH1_ADDR_ENC_ERR_EN], DCMRWD17[FLASH1_REF_ERR_EN], DCMRWD17[FLASH1_RST_ERR_EN], DCMRWD17[PRAM3_ECC_ERR_EN], DCMRWD17[PRAM3_FCCU_ALARM_EN], DCMRWD7[FLEXCAN8_DBG_DIS_CM7_0], DCMRWD7[FLEXCAN9_DBG_DIS_CM7_0], DCMRWD7[FLEXCAN10_DBG_DIS_CM7_0], DCMRWD7[FLEXCAN11_DBG_DIS_CM7_0], DCMRWD9[FLEXCAN8_DBG_DIS_CM7_1], DCMRWD9[FLEXCAN9_DBG_DIS_CM7_1], DCMRWD9[FLEXCAN10_DBG_DIS_CM7_1], DCMRWD9[FLEXCAN11_DBG_DIS_CM7_1], DCMRWD13[FLEXCAN8_DBG_DIS_CM7_2], DCMRWD13[FLEXCAN9_DBG_DIS_CM7_2], DCMRWD13[FLEXCAN10_DBG_DIS_CM7_2], DCMRWD13[FLEXCAN11_DBG_DIS_CM7_2], DCMRWD20[FLEXCAN8_DBG_DIS_CM7_3], DCMRWD20[FLEXCAN9_DBG_DIS_CM7_3], DCMRWD20[FLEXCAN10_DBG_DIS_CM7_3], DCMRWD20[FLEXCAN11_DBG_DIS_CM7_3], DCMRWF2[MAC_TX_RX_CLK_MUX_BYPASS] and DCMRWF4[MAC2_TX_RX_CLK_MUX_BYPASS].

- Added note in DCMRWF3[MAC_RX_CLK_MUX_BYPASS], DCMRWF3[MAC_TX_CLK_MUX_BYPASS], DCMRWF4[MAC2_RX_CLK_MUX_BYPASS], and DCMRWF4[MAC2_TX_CLK_MUX_BYPASS].
- Deleted DCMROD4[PF2_CODE_ECC_ERR], DCMROD4[PF2_DATA_ECC_ERR], DCMROD3[PF3_CODE_ECC_ERR], DCMROD3[PF3_DATA_ECC_ERR], DCMRWD3[PF3_CODE_ECC_ERR_EN], and DCMRWD3[PF3_DATA_ECC_ERR_EN].
- Revised DCM controlled features and availability in product family to remove DCMROD4[PF2_CODE_ECC_ERR], DCMROD4[PF2_DATA_ECC_ERR], DCMROD3[PF3_CODE_ECC_ERR], DCMROD3[PF3_DATA_ECC_ERR], DCMRWD3[PF3_CODE_ECC_ERR_EN], DCMRWD3[PF3_DATA_ECC_ERR_EN].

- Added long description in registers Read Write GPR On Destructive Reset 16 (DCMRWD16), Read Write GPR On Destructive Reset 17 (DCMRWD17), Read Write GPR On Destructive Reset 19 (DCMRWD19), Read Write GPR On Destructive Reset 20 (DCMRWD20), Read-Only GPR On Destructive Reset 9 (DCMROD9), and Read-Only GPR On Destructive Reset Register (DCMROD8).

- Update DCM controlled features and availability in product family.
- Added DCMROD9[AES_KP_CRC_SAFETY_ERR].

B.39 DCM module changes

No substantial content changes.

B.40 Messaging Unit (MU)

B.40.1 Chip-specific MU information changes

No substantial content changes.

B.40.2 MU module changes

- Updated Asynchronous system reset.

- Deleted topic "Sending messages with interrupt" and revised Initialization to add information "MU does not require initialization.".

B.41 Power management changes

• Added new topic SMPS. • Revised Figure 178 and Faster Standby mode exit to remove the content related to bitfield SIRC_TRIM_BYP_STDBY_EXT.
• Revised SW1: Module shutdown process.

B.42 Power Management Controller (PMC for S32K34x, S32K322, S32K324, and S32K314) changes

No substantial content changes.

B.43 Power Management Controller (PMC for S32K310, S32K311 and S32K312) changes

No substantial content changes.

B.44 Power Management Controller (PMC for S32K358, S32K328, S32K338, and S32K348) changes

No substantial content changes.

B.45 Power Management Controller (PMC for S32K388) changes

No substantial content changes.

B.46 Mode Entry Module (MC_ME)

B.46.1 Chip-specific MC_ME information changes

• Peripheral clock gating: — Updated table 'MC_ME partition peripheral mapping and clock control' for MU3 MUA and MU3 MUB.

B.46.2 MC_ME module changes

• Added Main Core ID Register (MAIN_COREID).

B.47 MC_PCU changes

No substantial content changes.

B.48 Wakeup Unit (WKPU)

B.48.1 Chip-specific WKPU information changes

No substantial content changes.

B.48.2 WKPU module changes

No substantial content changes.

B.49 Safety overview changes

- Updated section Self-test.

B.50 Error Injection Module (EIM)

B.50.1 Chip-specific EIM information changes

- Added EIM0 base address.

B.50.2 EIM module changes

- Updated revision history title to "EIM module changes".

B.51 Error Reporting Module (ERM)

B.51.1 Chip-specific ERM information changes

- Added ECC error address remapping (S32K389).

B.51.2 ERM module changes

- Updated the bitfield access from ROZ to RW at position 26 in CH0 register.

B.52 Fault Collection and Control Unit (FCCU)

B.52.1 Chip-specific FCCU information changes

No substantial content changes.

B.52.2 FCCU module changes

- Updated the External signals.

B.53 SELFTEST_GPR module changes

No substantial content changes.

B.54 Self-Test Control Unit (STCU2)

B.54.1 Chip-specific STCU2 information changes

- Updated BIST index in Table 303.
- Remove DMA controller from Table 299.
- Added Table 310.
- Updated Table 306.

B.54.2 STCU2 module changes

- Removed topic "Use cases and limitations".
- Revised FSM description, changed state machine to FSM.
- Revised Peripheral bus interface and Glossary.
- Revised description for CFG[PTR], CFG[CLK_CFG] , CFG[LB_DELAY] , LB_CTRL0[PTR], and MB_CTRLn[PTR].
- Revised description for MBSSWn and MBESWn.

B.55 Register Protection (REG_PROT)

B.55.1 Chip-specific REGPROT information changes

No substantial content changes.

B.55.2 REG_PROT module changes

- In GCR[HLB], added a note.

B.56 Clock Monitoring Unit – Frequency Check (CMU_FC)

B.56.1 Chip-specific CMU_FC information changes

No substantial content changes.

B.56.2 CMU_FC module changes

No substantial content changes.

B.57 Clock Monitoring Unit – Frequency Meter (CMU_FM)

B.57.1 Chip-specific CMU_FM information changes

No substantial content changes.

B.57.2 CMU_FM module changes

No substantial content changes.

B.58 Cyclic Redundancy Check (CRC)

B.58.1 Chip-specific CRC information changes

No substantial content changes.

B.58.2 CRC module changes

No substantial content changes.

B.59 PCMC changes

No substantial content changes.

B.60 Analog-to-Digital Converter (ADC)

B.60.1 Chip-specific ADC information changes

- Added note "Self-test conversion in BCTU mode is not supported in S32K3xx devices" in BCTU Interface.

B.60.2 ADC module changes

- CDATA bit field description updated to "Contains conversion data from standard input n, determined by the SAR algorithm. The conversion data bit count is dependent on the conversion resolution selected (CALBISTREG[RESN]). Depending on the value of MCR[WLSIDE], the conversion data MSB bits start from 14 (MCR[WLSIDE] = 0) or 15 (MCR[WLSIDE] = 1).

B.61 Low Power Comparator (LPCMP)

B.61.1 Chip-specific LPCMP information changes

No substantial content changes.

B.61.2 LPCMP module changes

No substantial content changes.

B.62 Logic Control Unit (LCU)

B.62.1 Chip-specific LCU information changes

No substantial content changes.

B.62.2 LCU module

- Revised Features, LC diagram.
- Revised Figure 279, and Figure 280 to remove sync 2 and 3 inputs.
- Revised the long description of DBGEN[DBGEN].

B.63 Enhanced Modular IO Subsystem (eMIOS)

B.63.1 Chip-specific eMIOS information changes

No substantial content changes.

B.63.2 eMIOS module changes

No substantial content changes.

B.64 Body Cross-triggering Unit (BCTU)

B.64.1 Chip-specific BCTU information changes

No substantial content changes.

B.64.2 BCTU module changes

- Minor correction in figures of Trigger timing and Simultaneous trigger priority management.
- Updated Implementation.

B.65 Trigger MUX (TRGMUX)

B.65.1 Chip-specific TRGMUX information changes

No substantial content changes.

B.65.2 TRGMUX module changes

No substantial content changes.

B.66 Software Watchdog Timer (SWT)

B.66.1 Chip-specific SWT information changes

No substantial content changes.

B.66.2 SWT module changes

- Updated Initialize the SWT section to remove the bullet "Select the clock source (if there are more than one possible sources)".
- Removed 'Select the clock source' section.
- Updated Clocking section to add the following details "See the chip-specific SWT information to find the clock source that drives the countdown timer."

B.67 System Timer Module (STM)

B.67.1 Chip-specific STM information changes

No substantial content changes.

B.67.2 STM module changes

No substantial content changes.

B.68 Periodic Interrupt Timer (PIT)

B.68.1 Chip-specific PIT information changes

No substantial content changes.

B.68.2 PIT module changes

- In Example configuration using chained timers:
  - Updated the example configuration to (60 s/10 ns).
  - Updated the step 6 and 7 in the configuring PIT.
  - Updated the example code for Disable PIT to "PIT_MCR = 0x02"
- Updated the example code for Disable PIT to "PIT_MCR = 0x02" in Example configuration using the lifetimer.
- Updated the example code for Disable PIT to "PIT_MCR = 0x02" in Example configuration for general timers.

- Updated the section headings of Restart counter period, Change current timer period and Dynamically setting a new timer period.
- Replaced "...when it expires (CVALn - 0)" to "...when it expires (CVALn = 0)" in Chained timers.

B.69 Real Time Clock (RTC)

B.69.1 Chip-specific RTC information changes

No substantial content changes.

B.69.2 RTC module changes

No substantial content changes.

B.70 Low Power Serial Peripheral Interface (LPSPI)

B.70.1 Chip-specific LPSPI information changes

No substantial content changes.

B.70.2 LPSPI module changes

• Removed Low-power mode. • Updated Interrupts and DMA requests. • Removed paragraph from introduction to register descriptions, content is in Overview. • Updated IER[REIE] and IER[TEIE]. • Updated CFGR1[PCSPOL]. • Updated CFGR1[SAMPLE] description. • Updated RSR[SOF].
• Updated Transmit Command Burst (TCBR), Transmit Data Burst (TDBR0 - TDBR127), and Receive Data Burst (RDBR0 - RDBR127). • Added DMA support registers.
• Replaced "master" and "slave" with "controller" and "peripheral" throughout chapter.

B.71 Low Power Inter-Integrated Circuit (LPI2C)

B.71.1 Chip-specific LPI2C information changes

No substantial content changes.

B.71.2 LPI2C module changes

No substantial content changes.

B.72 Flexible I/O (FlexIO)

B.72.1 Chip-specific FlexIO information changes

No substantial content changes.

B.72.2 FLEXIO module changes

No substantial content changes.

B.73 CAN (FlexCAN)

B.73.1 Chip-specific FlexCAN information changes

No substantial content changes.

B.73.2 FlexCAN module changes

No substantial content changes.

B.74 Synchronous Audio Interface (SAI)

B.74.1 Chip-specific SAI information changes

No substantial content changes.

B.74.2 SAI module changes

No substantial content changes.

B.75 Ethernet Media Access Controller (EMAC)

B.75.1 Chip-specific EMAC information changes

No substantial content changes.

B.75.2 ENET_Controller module changes

• Updated registers MAC_Hash_Table_Reg0 and MAC_Hash_Table_Reg1 to add the note "In this chip, upper 6 bits should be used for 64-bit Hash Table". • Deleted DMA_Safety_Interrupt_Status[DECIS] and DMA_Safety_Interrupt_Status[DEUIS] and added DMA_Safety_Interrupt_Status[1:0] as reserved.

B.76 Gigabit Ethernet Media Access Controller (GMAC)

B.76.1 Chip-specific GMAC information changes

• Added note 'For multi-master applications, it is recommended to configure the DMA_SysBus_Mode[FB] bit to 1 in order to fix the length and avoid any master taking over the bus which would represent a performance drop in the throughput.' in GMAC instances and configuration

B.76.2 GMAC module changes

• Updated the GMAC chapter to include brief description for all the registers and fields to align it with EMAC chapter. • Revised the figure "Module with multiple channels and queues block diagram" to remove RTBI, TBI, SGMII,and SMII interfaces. • Added description for "IPEMRWC".
• Deleted DMA_Safety_Interrupt_Status[DECIS] and DMA_Safety_Interrupt_Status[DEUIS] and added DMA_Safety_Interrupt_Status[1:0] as reserved.

B.77 Low Power Universal Asynchronous Receiver/Transmitter (LPUART)

B.77.1 Chip-specific LPUART information changes

No substantial content changes.

B.77.2 LPUART module changes

• Added Baud rate tolerance and Calculating baud rate tolerance.
• Replaced "receive data" with "Receive data (from RxD)" in Figure 488. • Replaced 'sever to 10 bits' with 'along with N (7, 8, 9, 10) bits' in Receiver functional description. • Replaced "When CTRL[LOOPS] is 1,..... (CTRL[RSRC] = 1)." with "Enable Loop mode.....CTRL[RSRC] = 0" in Loop mode. • Replaced "When CTRL[LOOPS] is 1.....(CTRL[RSRC] = 1)" with "Enable single.....CTRL[RSRC] = 1" in Single-Wire mode.
• Replaced the word ‘DTS’ with ‘CTS’ in Hardware flow control. • Changed the line ‘This is called resynchronization’ with ‘This Synchronization.....as Resynchronizarion’ in Data sampling technique. • Updated Figure 491. • Updated the long description of DATA[IDLINE].
• In CTRL register, replaced the field DOZEEN with reserved. • Updated Low-Power modes.

B.78 Chip-specific QuadSPI information changes

No substantial content changes.

B.79 Chip-specific QuadSPI information changes

• In Table 722 replaced AHB buffer size with the Rx buffer. • Updated the DLL and Data learning support in QuadSPI configuration and Supported read modes.

B.80 Quad Serial Peripheral Interface (QuadSPI) for S32K388 and S32K389

B.80.1 Chip-specific QuadSPI information changes

• In Table 769 replaced AHB buffer size with the Rx buffer. • Updated the DLL and Data Learning support in QuadSPI configuration and Supported read modes.

B.80.2 QuadSPI module changes

• Revised note in Dummy Pad loopback.

B.81 Ultra Secured Digital Host Controller (uSDHC)

B.81.1 Chip-specific uSDHC information changes

No substantial content changes.

B.81.2 uSDHC module changes

No substantial content changes.

B.82 Debug changes

- Revised Table 833, Trigger number 0,1 and 2 for CTI instance CTI_0.
- Updated Table 834 and removed notes for Closed and Disabled.

B.83 JTAG Controller (JTAGC)

B.83.1 Chip-specific JTAGC information changes

No substantial content changes.

B.83.2 JTAGC module changes

No substantial content changes.

B.84 JDC module changes

No substantial content changes.

B.85 TEMPSENSE module changes

- Updated Overview and Conversion from voltage to temperature

Legal information

Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at https://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

Suitability for use in automotive applications (functional safety) — This NXP product has been qualified for use in automotive applications. It has been developed in accordance with ISO 26262, and has been ASIL classified accordingly. If this product is used by customer in the development of, or for incorporation into, products or services (a) used in safety critical applications or (b) in which failure could lead to death, personal injury, or severe physical or environmental damage (such products and services hereinafter referred to as "Critical Applications"), then customer makes the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, safety, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP. As such, customer assumes all risk related to use of any products in Critical Applications and NXP and its suppliers shall not be liable for any such use by customer. Accordingly, customer will indemnify and hold NXP harmless from any claims, liabilities, damages and associated costs and expenses (including attorneys' fees) that NXP may incur related to customer's incorporation of any product in a Critical Application.

NXP B.V. — NXP B.V. is not an operating company and it does not distribute or sell products.
